The question, however, is whether the legislature could constitutionally make a class of the group it did select. That is, whether there is any rational basis for such a selection. We see no reason for doubt upon this point. Whether the legislature could have gone farther is not the question. The class it did select is identified by the state court in terms which clearly show that the persons within that class constitute a dangerous element in the community which the legislature in its discretion could put under appropriate control. As we have often said, the legislature is free to recognize degrees of harm, and it may confine its restrictions to those classes of cases where the need is deemed to be clearest. If the law 'presumably hits the evil where it is most felt, it is not to be overthrown because there are other instances to which it might have been applied."

In the present statute, continued the Supreme Court, the legislature restricted its application to that class of criminal sexual psychopathic persons who have been charged with a criminal offense, thereby restricting such act to cases where the need is deemed to be clearest and where the evil is most apparent. Such statute should not be overthrown because there may have been other instances in which it might have applied.

The court next dismissed as without any merit a contention by the defendant that the statute by a provision that at the hearing before the trial court it shall be competent to introduce evidence of the commission by such person of any number of similar crimes violated a provision of the Michigan constitution prohibiting the legislature from passing any ex post facto law. The prohibition against the enactment of an ex post facto law, the court pointed out, applies only to criminal statutes. The statute here in question is not a criminal statute nor are the proceedings under it criminal in nature but rather are analogous to civil inquests for the determination of questions of insanity.

For the reasons stated, the order of the trial court committing the defendant to the state hospital commission to be confined in an appropriate institution under the commission's jurisdiction was affirmed.—*People v Chapman*, 4 N. W. (2d) 18 (Mich., 1942).

**Malpractice Death of Patient from Eclampsia, Alleged Abandonment**—The plaintiff engaged the defendant physician to attend his wife during childbirth. The wife died and in a subsequent suit for damages the plaintiff alleged that the death was caused by the negligent and improper treatment rendered by the defendant. From a judgment for the defendant on a directed verdict, the plaintiff appealed to the Court of Appeals of Kentucky.

The defendant was called to the plaintiff's home on the morning of Aug. 16, 1938. When he arrived there at about 7:30 a. m. he found the patient in a convulsion and was advised that

she had already suffered two previously. He immediately administered a hypodermic, examined the patient's heart, took her blood pressure and said that he "found no trouble there" but believing that the patient's condition was very serious he suggested that another physician be called. Before the second physician arrived the patient had another convulsion, and magnesium sulfate was administered intramuscularly. Labor was progressing, but the two physicians agreed that more dilatation was necessary and thytuitary was administered. During the delivery the assisting physician used forceps while the defendant administered chloroform to prevent a recurrence of the convulsions. After the birth, the defendant took charge of the mother, administered pituitary to control bleeding and to regulate contraction of the uterus and remained with the patient and examined her periodically, according to his testimony, for about an hour and a half during which time the patient was unconscious. Before the defendant left he administered a heart stimulant, which he testified could not have been repeated for three or four hours, told the family where he could be reached and suggested that "if there was anything they didn't understand to call him." When he was called later he hurried back, but the patient had already died. It was agreed that the cause of death was shock and convulsions due principally to eclampsia.

The plaintiff's chief contention seemed to be that the patient's death was due to the fact that the defendant left precipitately without making suitable arrangements for the care of the patient. But, said the court, there was no evidence to indicate that the defendant precipitately left the patient. He remained at least forty-five minutes after the delivery, according to the plaintiff's own testimony. The defendant testified that he remained twice that long and that when he finally had to go to see another patient he left word as to how he could be reached. Also, the defendant testified, "Had we remained at her bedside we could not have saved her or prolonged her life, we had already done everything that medical science knew. We left nothing undone. In this he was corroborated by the physician who was called in to assist him. The expert witness called by the plaintiff admitted that in childbirth cases, where the mother has convulsions, "they die in spite of all the doctor can do." This witness also stated that the procedure adopted in delivering the baby and the question of what drugs to administer, how to administer them and with what frequency were entirely up to the attending physician in each individual case.

The Court of Appeals pointed out that a failure to effect a cure raised no presumption of want of proper care, skill or diligence on the part of a physician. No proof was found by the court to show that the death was caused by anything except shock coming at a time when the patient's condition was such as to be able to meet it. Before the plaintiff is entitled to recover, the court said, it must be shown that the defendant was negligent and that his want of skill or neglect to do something which a physician of ordinary skill would have done resulted in death or injury. No such showing was made in this case, and the judgment for the defendant was therefore affirmed.—*Williams v Tarter*, 151 S. W. (2d) 783 (Ky.), 1941.

### COMING MEETINGS

- American Association of Obstetricians, Gynecologists and Allied Surgeons, White Sulphur Springs, W. Va., Sept. 10-12. Dr. J. R. Bloss, 418 Eleventh St., Huntington, W. Va., Secretary.
- American Association of Railway Surgeons, Chicago, Sept. 10-11. Raymond B. Kepner, 547 West Jackson Blvd., Chicago, Sec. 91.
- American Congress of Physical Therapy, Pittsburgh, Sept. 9-11. Richard Kovacs, 2 East 88th St., New York, Secretary.
- Idaho State Medical Association, Sun Valley, Sept. 16-19. Dr. J. Jeppesen, 105 North 8th St., Boise, Secretary.
- National Medical Association, Cleveland, Aug. 17-21. Dr. J. T. Givens, 1108 Church St., Norfolk, Va., General Secretary.
- Oregon State Medical Society, Portland, Sept. 9-11. Dr. J. Montague, 1020 S. W. Taylor St., Portland, Secretary.
- Utah State Medical Association, Provo, Aug. 27-29. Dr. D. G. McIntyre, 610 McIntyre Bldg., Salt Lake City, Secretary.
- Washington State Medical Association, Spokane, Aug. 17-19. Dr. J. Spickard, 1305 Fourth Ave., Seattle, Secretary.
- Wisconsin State Medical Society of Milwaukee, Sept. 15-17. Charles H. Crownhart, 110 East Main St., Madison, Secretary.
- Wyoming State Medical Society, Cheyenne, Aug. 16-18. Dr. J. Keith, Capitol Bldg., Cheyenne, Secretary.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 15 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk ( \* ) are abstracted below.

- Synovial Sarcomatoidoma (Sarcoendothelioma). H. R. Fisher. Philadelphia—p. 529.

**Malignant Lymphoma**—Gall and Mallory point out that many generic terms have been utilized to designate diseases of the lymphatic system characterized by progressive tumor-like enlargement of lymphoid tissue with eventual fatality, and histologically by multiplication of one or more of the elements normally present in lymph nodes to the point of destruction of the nodal architecture. Malignant lymphoma seems to have won most general usage in this country and has the advantage of being noncommittal as to pathogenesis. In recognition of the complexity of the problem the American Association of Pathologists and Bacteriologists established a Registry of Lymphatic Tumors and in 1934 set the seal of the registry's approval on the schematization and terminology employed. This represented an essential fusion of three classifications: (1) cytologic based on morphologic recognition of component proliferating cells; (2) gross anatomic depending on the distribution of the process throughout the organs of the body; and (3) clinical contingent on physical signs and hematologic manifestations. The authors offer a somewhat different classification because attempts to apply the registry's terminology convinced them that it is not practical for routine use. They present a cytologic classification of malignant lymphomas and show its advantages in a clinicopathologic survey of 545 cases (73 cases of the 618 studied histologically lacked adequate clinical data). They demonstrated by multiple examinations at significant time intervals that the cytologic type is remarkably constant although a few cases show a progressive failure of differentiation as the disease progresses. In contrast in a classification based largely on distribution such features as the presence or absence of leukemia, generalization versus localization and sarcomatous growth were considered important. These have been shown to be inconstant and changeable thereby requiring variation in classification from time to time in order to fit the stage of the disease. The vast majority of the 618 cases from which histologic material was available could be readily divided into seven categories: stem cell lymphoma, clasmatoctytic lymphoma, lymphoblastic lymphoma, lymphocytic lymphoma, Hodgkins lymphoma, Hodgkins sarcoma and follicular lymphoma. This differs from accepted classifications primarily in the subdivision into two types of what has generally been grouped under the heading reticulum cell sarcoma, one

in which the cells are highly undifferentiated and resemble lymphoid stem cells, for which the authors have proposed the name stem cell lymphoma, and a second in which the cells show recognizable features of differentiation in the direction of tissue phagocytes, which they have termed clasmatoctytic lymphoma. It has also proved useful to divide the tumors showing clear evidence of belonging to the lymphocyte series of cells into lymphoblastic and lymphocytic types depending on whether the immature or the mature cells predominate. Hodgkins disease too has appeared divisible into lymphomatous and sarcomatous types. Follicular lymphoma has been shown to be a form of malignant lymphoma and not, as has been claimed, merely an inflammatory process. The value of this classification was put to the test of clinical correlation and, although considerable overlapping was observed, sufficiently constant differences were found in the age of onset, duration of the disease, maximal frequency or involvement of various organs and tissues, tendency to localization or generalization, the development of leukemia and the degree of radiosensitivity to delineate a series of recognizably different clinical syndromes.

**Pneumoconiosis in the Talc Industry**—Porro and his co-workers attempt to correlate the dusty occupation of talc mining and milling with a definite morbidity. During the last ten years one of the authors has noted that talc workers examined at chest clinics presented diffuse pulmonary changes believed to be at least partly due to exposure to dust. Since 1937 when the New York State compensation laws became effective medical consultants of the New York State Department of Labor have rendered decisions that disability was produced in this industry. The authors report 15 cases in which a history of exposure to talc dust was chronologically related to the onset of symptoms. From Dreesen's analysis it appears that the dust responsible for the disabling pneumoconiosis must be talc itself in the form of tremolite or soapstone or both since free silica or other dust in high concentration was not found. The symptoms are those characteristic of disabling pneumoconiosis: dyspnea, cough, chest pain and weakness. Vital capacity was extremely low. The gross pulmonary changes in all cases are stiffening of the lungs, poorly outlined grayish bands and nodules appearing in the parenchyma and moderate enlargement of the tracheobronchial lymph nodes. Emphysema is universally present but is not grossly recognized in the mild case. In all except the least involved case extensive intrapleural adhesions are found and in all advanced cases there is a cor pulmonale. Microscopic changes consist chiefly in irregular areas and bands of cellular fibrosis surrounding the

vessels and bronchi and producing thickening of the alveolar walls. Histiocytes and fibroblasts are numerous in proportion to collagen fibers. Asbestosis bodies are frequently present in the lesions. This implies a degree of similarity between asbestosis and pneumoconiosis due to talc. While tuberculosis or other complication may be present, pneumoconiosis in itself is a reaction of living tissue to injury and therefore an inflammatory disease resembling other chronic inflammation. Diffuse haziness is the most constant roentgen abnormality and is probably the earliest detectable change. The general background of the pulmonary field may have a fine indefinite reticulation of lines. The appearance suggests that the haziness due to interstitial fibrosis has been modified by a fine emphysema. Another manifestation is usually general nodulation. Confluence of lesions and haziness usually begin in the areas of distribution of the lower lobe trunks. The diagnosis is made on the history of an adequate exposure and on the roentgen signs. If disability is present the characteristic symptoms are significant. If uncomplicated, the symptoms of talc pneumoconiosis are so unlike those of pulmonary tuberculosis that a differential diagnosis is comparatively easy. In uncomplicated talc pneumoconiosis the onset of symptoms marks the beginning of a disability from which recovery appears to be impossible. It is desirable to withdraw the worker from exposure prior to this time. There are roentgen changes before the onset of dyspnea or other subjective symptoms. The determination of vital capacity may be an effectual routine procedure in selecting workers that should be more thoroughly studied as potential subjects for withdrawal from further exposure. Standard exercise tests for the objective periodic determination of dyspnea may aid in the discovery of early pulmonary fibrosis. Measures to reduce the dust concentration should be instituted.

#### Cardiovascular System of American Roentgenologists

—The answers Raab obtained to a questionnaire from 344 American and Canadian roentgenologists more than 45 years of age suggest a blood pressure level slightly below the normal for all age groups. Peripheral vascular disease of a major degree and severe nephrosclerosis seemed to be relatively uncommon. The incidence of coronary disease without and with thrombosis was high. The majority of these persons were heavy smokers. Whether or not the results concerning blood pressure and peripheral vascular disease are attributable to prolonged roentgen "spray" effects on the cardiovascular system cannot be decided, but they do not seem to be incompatible with the working hypothesis that such exposure may exert a certain protective effect against an exhausting and ultimately destructive overactivity of the adrenal hormones and related substances within the myocardial and arterial muscular tissues.

**Diverticula of the Duodenum**—Rankin cites a case of a diverticulum of the duodenum which presented three unusual observations: the large diverticulum was diagnosed roentgenologically before operation, it contained a gallstone, and the stone was the largest on record, about 2 inches (5 cm) in diameter. The stone and the diverticulum were removed and the abdomen was closed. The patient made satisfactory postoperative progress for several days, but after a week her condition became retrogressive, the urinary output gradually decreased and renal dysfunction ensued in spite of treatment, the patient dying of uremia thirteen days after the operation.

**Hodgkin's Disease**—From 1918 through 1935, 265 patients with Hodgkin's disease proved by biopsy were treated at the Memorial Hospital. Of the group, 26 are living, 28 have been lost to follow-up and are considered dead, and all but 1 of the others died of the disease. The study enables Slaughter and Craver to regard certain cases of Hodgkin's disease in a slightly more optimistic light than heretofore. The prognosis in a certain type of case appears more favorable than in others. This has little to do with the micropathologic picture of the disease but depends rather on anatomic location and extent. Such a case would be defined as one with only one accessible node group involved, no deep adenopathy and no systemic symptoms as evidence of hidden disease. If irradiation alone is employed in such a case, "obliterative" irradiation would be better than light palliative doses. Surgical extirpation would be justified in such a case and should be tried in the future (followed by irradiation within the limits of cutaneous tolerance)

at least until enough cases are available for a reevaluation of the role of surgery in the disease. The average survival period for the 265 patients from the time of beginning therapy was 33.8 months. The average survival time for the 211 who died was 24.6 months. Of the patients 17.7 per cent survived five years following treatment and 3.4 per cent more than ten years.

**Brain Injury in War**—Kennedy presents a routine procedure for the treatment of cerebral injuries of war. Brown has demonstrated experimentally that a head injury to produce unconsciousness must accelerate the movement of the brain to not less than 28 feet per second. Such acceleration usually does not occur if the skull is penetrated by a missile fragment traveling at a high speed. Therefore a man injured in this manner becomes unconscious immediately, and usually has not been made unconscious by the impact of the missile. The missile having ploughed through such extensive area of cerebral tissue as to make recovery extremely unlikely. On the other hand, a nonpenetrating blow on the head will often cause immediate unconsciousness without necessarily having destroyed or even permanently injured any cerebral area. Today, because of the sulfonamide derivatives, if cerebral injuries are treated early it is possible to prevent their infection. The procedure presented is as follows: The hair is clipped, the scalp is washed with soap and water and local anesthesia induced. Mordant should not be used. Large bleeding vessels are caught with hemostats or by rubber tubing placed around the vessel. Wounds should be filled with sulfanilamide or sulfapyridine. Debridement should be as thorough as possible. Antitetanic serum should be given. Treatment for shock is to be instituted immediately and operation delayed for twenty-four to thirty-six hours, so that patients can be sent back to a place where facilities for roentgen study are available. Such a "head shot" should be as near the front area as is militarily possible. It is now possible to treat such patients with a closed operation. If a blood clot in the track of the missile is sucked out and the wound irrigated with warm saline solution. A rubber catheter is placed in the wound for exploration. Any wound big enough to be explored with a finger is hardly worth exploring. The track should be explored with sulfanilamide powder before it is closed. The track should be removed if accessible bone or metal fragments may do so. If the wound was done by the enemy who put them in, the procedure, sulfonamide drugs should be continued. Penicillin therapy should be started at once and continued for at least 10 days more. If the wound has not been treated with penicillin.

hours it must be treated as an infected open wound. Increased pressure and acute cerebral edema are dealt with by dehydration. In the care of nonpenetrating head injuries shock is treated by intravenous injection of 100 cc of a 50 per cent solution of hypertonic dextrose or blood serum. Lumbar puncture should be performed for diagnosis and treatment and the hypertonic dextrose solution repeated to reduce increased intracranial pressure. Caffeine with sodium benzoate, rectal taps, elevation of the head of the bed, operative procedures for suspected meningeal hemorrhage, antimeningococcus serum in suitable cases, antitetanus serum for all patients with a scratch, right subtemporal decompression for comatose patients who do not respond to the foregoing procedures within three days and elevation of uncomplicated depressed fractures of the skull are employed after the acute stage of shock has passed. Surgical intervention for this group of patients may often be safely postponed for many days.

**Potentialization of Sulfonamide Derivatives by Oxidants in Local Therapy of Wounds**—Goldberger states that his experience in 884 cases leads him to believe that the most effective local antibacterial agent is represented by a combination of sulfanilamide and sulfathiazole with an oxidant. Depending on the nature of the wound or infection a choice of powder, ointment, paste, jelly, solution or impregnated gauze can be used. The activating agent varies with the vehicle for the powder form zinc peroxide is favored, for the ointment and the paste azochloramide and zinc peroxide, and for solutions iodine, azochloramide and potassium permanganate. Regardless of the form of the medication used, a local excess of sulfonamides must be made constantly available for absorption by the tissues and to make up for that lost through excretion. The addition of a wetting agent such as sodium tetradeceyl sulfate, will enhance the effectiveness of the suspensions and ointments. The combination of a sulfonamide, an oxidizing agent and a wetting agent comprises the most effective local antibiotic mechanism. The combination of sulfanilamide and sulfathiazole is more effective than either alone. Idiosyncrasy to local therapy is rare. Potentiated sulfonamides are also antibacterial and antibiotic to other unicellular organisms, amebas, paramoebias, trichomonads, spermatozoa and certain fungi. Clinical and laboratory studies indicate that their action depends on a direct attack on the bacterial cells by oxidation, thus approximating the ideal surgical antiseptic, which is harsh to bacteria and kind to tissues.

**Endometriosis in Scars**—Wyrens and Randall collected 31 cases of true endometriosis in postoperative scars from the 1916 to 1941 records of the Mayo Clinic. The endometriosis was proved by microscopic study of the specimens in 15 it followed uterine suspension operations, in 4 cesarean section, in 4 salpingectomy, in 2 hysterectomy, in 2 myomectomy, in 1 simple appendectomy, in 1 drainage of an appendiceal abscess, in 1 inguinal herniorrhaphy and in 1 some type of pelvic operation performed elsewhere. In most of the cases the lesion followed operations performed on the uterus or fallopian tubes, but in the performance of most of them the lining of these organs was not exposed. A few of the tumors seem to have originated from exposed portions of endometrium and to have invaded the abdominal wall secondarily, but others were separated from the uterine lining. The best evidence for the etiology of this condition, which is unknown, points toward transplantation or invasion (migration) of endometrium from the lining of the uterus. The endometriomas in question resemble endometrium microscopically and in 1 an unabsorbed suture was presented which may or may not represent the contaminating vehicle during the original operation. In many cases in which the condition followed ventral suspension of the uterus the round ligaments were involved in endometriosis at the points at which they were sutured to the anterior abdominal wall. Pain worse at the menstrual period, and a palpable nodule, were the most common complaints. Few of the tumors discharged a bloody fluid at the menstrual period. In a few cases there were no symptoms. The differential diagnosis includes keloids, desmoids, fibromas, neuromas, incarcerated omental hernias and uterine or tubal fistulas. If the condition is uncomplicated cure may be obtained by wide excision. One recurrence was encountered, undoubtedly caused by inadequate excision at the first operation.

**Acute Cholecystitis**—McLanahan and his associates review the records of 140 patients with acute cholecystitis who were operated on by twenty-seven operators at the Union Memorial Hospital between September 1923 and November 1940. Sixty-three per cent of the patients were between 30 and 60 years of age. 34 were more than 60. Nausea or vomiting or both occurred in 85 per cent. Pain was almost a universal symptom. Jaundice was present in 20 per cent of the 96 with definite records. There were twelve deaths, seven occurred among the 28 undergoing drainage of the gallbladder and five among the 112 undergoing cholecystectomy. The gallbladders of the 7 patients who died following cholecystostomy were gangrenous, five of them had perforated. Of the 5 dying after cholecystectomy, the gallbladders of 3 were gangrenous and those of 2 were acutely inflamed without gangrene. Approximately half of the patients had had symptoms for more than a week. The mortality (three deaths) was highest among the 14 patients operated on in the first twenty-four hours, it became high again only after a week. Some postoperative complication developed in 31 per cent of the patients. The complications were pulmonary, myocardial, peritoneal, hemorrhagic or vascular.

**Intestinal Obstruction from Gallstones**—Foss and Summers report 10 personally observed cases and review 140 most significant records of the past two decades of similar cases. The relative incidence of intestinal obstruction from gallstones varied from 1 to 5 per cent. There were 130 women and 20 men, a ratio of 6.5:1. This corresponds to the relative incidence of cholelithiasis in the two sexes. The majority of patients were in the sixth and seventh decades of life. A gallstone large enough to cause intestinal obstruction rarely passes by way of the common duct, the most common route being a fistula between the fundus of the gallbladder and some portion of the duodenum. The sequence of events usually is cholelithiasis, ulceration and erosion of the gallbladder wall, pericholecystitis and the formation of a fistulous tract. Twenty-three of the 150 patients had no history suggestive of disease of the gallbladder, and 48 gave a history of epigastric pain interpreted as being associated with the process of perforation. A stone that enters the small intestine may pass spontaneously, but more often it produces characteristic intermittent symptoms of obstruction. The most frequent site for the stone to lodge is in the terminal portion of the ileum. Only early surgical intervention will lower the high mortality rate. The finding of a faceted stone at operation may be indicative of possible multiple stones.

**Acute Hematogenous Osteomyelitis**—Mahorner and Crain compare a series of 66 cases of primary acute hematogenous osteomyelitis admitted to Charity Hospital between 1937 and 1940 with a series of 112 cases admitted between 1930 and 1936. In the 66 the mortality was 66 per cent as contrasted with 24 per cent for the 112 cases. The important features responsible for the higher mortality were unjustified emergency operations without proper preoperative preparation, failure to reestablish preoperatively a normal physiologic state by fluid and electrolyte replacement and blood transfusions. New chemotherapeutic measures and immunotherapy have undoubtedly had a favorable influence. The study showed that operation performed after preparation is not a deleterious factor in itself and that opening the bone after preparation is no more harmful than incision and drainage. Evacuation of pus by simple incision or osteotomy would seem to be a favorable therapeutic measure. Osteotomy apparently does not influence the extent of osseous involvement. A measure of extreme importance from the operative point of view is vein ligation for patients with a persistent positive blood culture. Immobilization in a plaster encasement deserves wider application.

**Estrogenic Substances in Hyperthyroidism**—Storck and Sabatier report 11 cases of hyperthyroidism treated preoperatively with estrogens. The average basal metabolic rate for the group was +47.7 per cent, 4 of these were iodine fast and 4 manifested such toxicity as to be considered to require multiple stage operations. The response to preoperative treatment and operation of this group is compared with corresponding observations made in 11 cases of hyperthyroidism in which estrogenic therapy was not employed. The patients who received estrogen therapy looked and felt better than did the control group. This difference was most pronounced during the immediate postoperative period. An average preoperative lowering of pulse rate equal to that which occurred in the control group was observed in the estrogen treated patients even though more of them were iodine fast at the time of admission. The average peak pulse rate of the first postoperative day in the cases in which estrogen was administered was lower than the average peak pulse rate on the same day in the control group. No crisis occurred in the estrogen group. Estrogen therapy may be of value both in the prevention and in the treatment of thyroid crisis, especially following a first stage lobectomy. Small doses of estrogenic substances are as effective as large doses, if not more so. Estrogen therapy is most effective when administered for from four to seven days preceding the operation when subtotal thyroidectomy is performed. It seems advisable to continue estrogen therapy for several days following the first stage and to reinstitute estrogen therapy preceding the second stage, especially if there is a lapse of more than a week between operations. Estrogen therapy is valuable only as an adjunct in the surgical treatment of hyperthyroidism. No significant difference has been observed in the response to estrogen by patients with toxic diffuse goiter and those with toxic nodular goiter. The number of cases in which estrogen therapy has been employed is too small to be statistically significant.

**Treatment of Trichomonas Vaginalis Vaginitis with Lactobacillus**—Brady and Reid treated vaginitis due to *Trichomonas* by introducing viable lactic acid forming bacilli into the vagina. Sterile skim milk is inoculated with a culture of *Lactobacillus bulgaricus*. After forty-eight hours' incubation, 1,000 cc of this culture is mixed with 325 Gm each of XXXX sugar and milk sugar. This is thoroughly dissolved in the milk, and the mixture is spread in layers on enamel pans and dried in a vacuum oven at 37 C. The mixture is scraped from the pans, broken into bits and replaced in a drier to complete desiccation. When completely dried, 6 cc of white liquid petrolatum and 38 Gm of starch are added. The mixture is then pressed into tablets. The finished tablets weigh 13 Gm and represent 125 cc of original culture. A bivalve speculum is introduced, the vagina is dried with cotton and two lactobacillus tablets are inserted high in the posterior fornix. The vaginal orifice is then plugged with a tampon of nonabsorbent cotton. The next day the tampon is removed, material is taken from the vagina for microscopic study and the treatment is repeated daily for

from four to six days. The patient is then told to insert one lactobacillus tablet high in the vagina each night and to take douches only if she becomes uncomfortable from unabsorbed particles coming out of the vagina and causing irritation. A white vinegar douche (5 per cent acetic acid) is recommended in a strength of from 2 to 4 tablespoons to 2 quarts of water. Two douches a week are sufficient. This home treatment is continued from three to six weeks and longer if necessary. If the organisms promptly disappear, the tablets need be used only every other night. It is especially important that they be used while the patient is menstruating, as that is the time when the vaginal defenses against the trichomonads are weakest. In a series of 50 patients thus treated all showed immediate improvement and in many instances the organisms disappeared at once. Nevertheless treatment was continued from three to six weeks and, when necessary, longer. Six patients who had been thought cured had recurrences, perhaps in some instances these were reinfections. The recurrence cleared up more rapidly than did the first infection. Forty-eight of the series now have negative smears and are asymptomatic. Many of these patients have now been followed for six months.

**Acoustic Tumors**—Nielsen analyzes the late results of Olivecrona's series of acoustic tumors. In this series of 139 patients with surgically verified acoustic neurinoma the youngest patient was 18 years of age and the oldest 68. The acoustic nerve was involved in 99.2 per cent, nystagmus was present in 96.2 per cent, choked disks were found in 90.8 per cent and roentgenograms were positive in 81.5 per cent, as evidenced by changes at the internal acoustic meatus. Improved operative technic has lowered the mortality rate to 11.1 per cent in the group of complete extirpations during 1937 to 1939. Complete removal of the tumor is the operation of choice because recurrences are rare, the danger of secondary hemorrhage is much less than in incomplete removal and the presence of scar tissue in secondary operations increases the danger and makes saving of the facial nerve almost impossible. Radical removal should be attempted in all cases except those in which the tumor is cystic or the saving of the facial nerve imperative. If the saving of the facial nerve is imperative an almost complete extirpation may still be possible by leaving a bridge of tumor tissue covering the facial nerve from the internal acoustic porus to the pons. The facial nerve may be saved in practically all cases of intracapsular enucleation. In the group of subtotal extirpation, improved technic has made saving of the facial nerve possible in the majority of instances. When complete extirpation was performed the facial nerve was spared in 15, or 65 per cent, of 23 cases. The morbidity as expressed in inability to work has been lowered to 12.4 per cent in the group of complete extirpations. Of the 103 survivors followed up, 78, or 75.7 per cent, had full or diminished earning power, exclusive of the convalescent patients.

**Oral Treatment of Hay Fever**—Iliff and Gay observed 62 patients with hay fever who took ragweed pollen orally before the season started and 20 during the season. The beginning dose was 500 Noon units. This was increased according to a definite schedule until daily totals varying from 60,000 (at the sixteenth dose) to 240,000 units were reached. In pre-seasonal treatment the dose was given soon after a meal two or three times a week and increased to daily intake with the onset of symptoms. In coseasonal treatment it was given daily or in a few cases three times a day until the maximal dose was reached. Of the patients treated pre-seasonally 3 obtained almost complete relief, 10 good relief, 25 fair results, 21 were not benefited and 3 stopped treatment because of reactions. Of the 20 treated coseasonally 14 were mildly benefited, 4 obtained no relief and 2 stopped treatment. For comparison, of 37 patients treated perennially or pre-seasonally by hypodermic administration during the same season 13 had excellent, 11 good, 9 fair results and 4 failed to obtain any benefit. An analysis of the factors involved in the 25 who failed to obtain benefit from oral treatment revealed that 1 had pansinusitis during the season, 11 gave definite evidence of other allergy or of psychogenic factors, 2 were treated coseasonally too late, 3 had received previous injection treatment without benefit and in 8 there were no contributory factors. Studies of the reagent content of the serum of 7 patients failed to show any change. Reactions in 33 patients were for the most part not severe and were fairly readily controlled. Almost all were gastrointestinal.

**Antibody Response to Influenza Vaccination**—Hirst and his collaborators used eleven different preparations of influenza virus to vaccinate approximately 150 human beings with each one. The antibody response to these vaccines was measured by the in vitro agglutination inhibition test. The comparison of the geometric mean titers of serums taken two weeks after vaccination showed that: 1 There was a wide individual variation in the antibody response of human beings to the same preparation of influenza virus administered subcutaneously. The amount of antibody produced by a group with a low prevaccination antibody level was nearly the same as that produced by groups with higher initial levels. 2 The use of the X strain or distemper virus in the influenza vaccine did not enhance the antigenicity of the influenza virus present. 3 Within certain limits the mean antibody response increased according to the amount of virus injected. When the amount injected was large the magnitude of the antibody response was the same as that which follows actual infection. 4 When the vaccine was prepared from allantoic fluid there was no significant difference in the antibody response to active virus formaldehyde inactivated virus heat inactivated virus or virus inactivated by the drying process. 5 Ground infected chick embryos, when diluted with infected allantoic fluid, gave a greater antibody response than allantoic fluid alone (when the virus remained active). The antigenicity of such a preparation was diminished when the virus was inactivated by formaldehyde. 6 The antibody level six and nine weeks after vaccination dropped from the two week postvaccination level. In a small group the level at five months was still further reduced. Individuals who had higher titers tended to lose the antibodies faster than did those who had lower levels.

**Histamine in Raynaud's Disease and Acrocyanosis—** Histamine by iontophoresis was employed by Shulman in the treatment of 10 patients with Raynaud's disease and in 2 with acrocyanosis limited to the upper extremity. The average blood flow before iontophoresis as measured by the Hewlett plethysmograph was 797 cc. Following treatment there was an average increase in 11 of the 12 patients of 351 cc, or 44 per cent. The extremes were 110 and 871 cc. One patient showed no change. The hand capacity volume following iontophoresis increased to an average of 1218 cc as compared to an average of 826 cc during the resting state before treatment. The patient who had no change in rate showed a decrease of 22 cc in capacity volume. Symptomatically the patients have been afforded much relief, and the frequency and duration of the attacks (in Raynaud's disease) was decreased.

**Intraspinous Protrusion of Intervertebral Disks—** Klemme and his associates believe that a positive diagnosis of protruded intervertebral disk can be made only when definite fluoroscopic evidence is obtained by the intraspinal use of iodized oil. The iodized oil can be injected and then removed at

the conclusion of the fluoroscopy. They describe a special type of needle which facilitates the procedure. The needle has a second opening on the back just above the bevel. This allows a free flow of fluid when the usual opening may be closed by a nerve root or arachnoid. The most important single feature of the entire procedure is to introduce the needle in the exact midline. Its position is checked fluoroscopically, and if it is not in the midline it is reintroduced. The iodized oil must be maneuvered into every part of the spinal subarachnoid space that is to be investigated. The filling defect must be constant on repeated examinations and must persist with the patient in different positions. The iodized oil must be kept together in one single mass as it is followed past each set of nerve roots, and the sheaths are allowed to fill. Any filling defects should be recorded with anteroposterior and oblique spot films. At the fluoroscopy the iodized oil is maneuvered beneath the needle by tilting the table and is removed by suction applied to the needle.

**Milk Allergy in Newborn—**Rubin describes a syndrome in newborn infants which is a manifestation of milk allergy. In each of his patients there was a strong parental history of allergy, cow's milk feeding was started immediately or within a few days of birth, but hunger, or what the mother thought was hunger, was a constant complaint. This "hunger" probably represented abdominal discomfort manifested as "colic." Despite the abdominal distress, weight gain was not impaired. The "colic" first appeared about three weeks after feeding with cow's milk was begun and became progressively worse. Within a few days after its onset loose stools appeared, soon to contain mucus and bright red blood. The amounts of blood varied from small pinhead size clots to profuse hemorrhage containing fecal matter. The blood disappeared from the stools within forty-eight hours after cow's milk was withdrawn from the diet. The mucus in the stools and the "colic" disappeared shortly afterward. In most of the infants diathetic eczema developed within a few months after the onset of the intestinal syndrome, and 2 infants have also had asthma. All except 1 infant tolerated goat's milk. Eggs, orange juice and cod liver oil, given in the early period, may also be offenders.

Cardiac Massage J C Nicholson—p 385

**Treatment of Fractured Ribs**—Smith relieved the pain of fractured ribs in 12 cases by injecting nupercaine around the fracture. Usually the sharp stabbing pain disappeared at once, in only 3 instances one other, and in 1 two other injections were required. The immediate disappearance of the sharp stabbing pain confirms the fact that it has its origin in the fracture. The patient was usually left with the less localized dull ache. The sharp pain did not return, although the action of the anesthetic could hardly have lasted more than twelve to twenty-four hours. However, the dull ache persisted for about ten days. In treating fractured ribs by this method injury to other structures or the development of a pleural effusion or hemothorax must not be overlooked. As the pain is relieved by one injection, some permanent change must take place probably the relief of spasm, allowing the fractured surfaces to resume a normal position.

field—p 436

**Treatment of Phosphorus Burns**—Godding and Nutton propose the following first aid treatment for phosphorus burns (after experiments in rats), which can be included as part of the soldier's standard equipment. First stage. Remove the bulk of the free phosphorus and superficial acid with alkali powder (formula 2, 10 per cent of heavy magnesium oxide, 5 per cent of borax and 85 per cent of sodium carbonate). Under

no circumstances must liquid suspected of containing phosphorus be dabbed with a handkerchief or other dry material. If water has been used to extinguish the phosphorus, sprinkle the powder on to the wet surface, add more water if necessary, and work up to a medium thick paste covering the whole of the burn and the surrounding area if contamination is suspected. Wash or wipe off and reapply as long as effervescence continues. Drying must be avoided at this stage. The advantages claimed over the official treatment are greater concentration and osmotic effect and the prevention of displacement of unignited phosphorus to other parts of the body or clothes. Second stage. Immobilize the whole of the remaining free phosphorus by the use of glycerin copper sulfate paste (formula 3 or 4, 22.5 per cent of copper sulfate, 67.5 per cent of glycerin, 5 per cent of starch and 5 per cent of water or 20 per cent of copper sulfate, 40 per cent of glycerin, 7.5 per cent of starch, 1 per cent of sodium tauroglycocholate and 31.5 per cent of water). Apply sparingly but thoroughly, and rub well in. Remove by washing or wiping as soon as no smell of phosphorus is perceptible in the wound. The advantages claimed over the official treatment are concentration, rapidity, osmotic effect and completeness of action. Third stage. Neutralize the deep seated penetration of acid with alkaline powder (formula 2a). Reapply the powder work up to a paste with water, bandage and dampen the bandage occasionally. Do not allow bandages to dry. The importance of this stage has apparently not been previously recognized. Fourth stage. Remove to hospital labeled "phosphorus burn" where subsequent treatment should avoid all forms of coagulation therapy (tannic acid, picric acid, silver nitrate) in view of the obvious necessity for not "sealing in" the acid products. The painful nature of phosphorus burns and their tendency to delayed healing may possibly result from the inadequate treatment of the concentration of acid, and the alkalinity of the tissues may not be sufficient to deal with it. Therefore the continued treatment should be alkaline and might consist ideally of the envelop treatment with sodium hypochlorite solution.

**Minimal Requirements of Nicotinic Acid**—The minimal requirement of nicotinic acid sufficient to prevent pellagra in man is about 8 to 10 mg daily. This amount, Kodicek points out, may not be enough to prevent subdeficiencies. White bread has little nicotinic acid, and the average current diet containing white bread furnishes a mean daily intake of about 9 mg. A diet with wholemeal bread would increase the daily intake to about 12.3 mg. The substitution of wholemeal or 85 per cent wheatmeal for white bread would thus render the supply adequate. Pellagra has been reported in northern Ireland.

**Pneumoperitoneum After Laparotomy**—In the course of laparotomies air enters the abdominal cavity and some of it remains in the peritoneal cavity after closure of the abdomen. This air, according to Imbach, can be demonstrated clinically by a complete or partial obliteration of the hepatic dulness and roentgenologically by the presence of a crescentic shadow between the diaphragm and the liver. In the case of pressure changes in the abdomen this air exerts a tension stimulus on the sensory receptors of the phrenic nerve in the diaphragm and may elicit subjective sensations such as pain in the shoulder, piercing pain in the chest and a feeling of pressure under the sternum. These harmless manifestations may be mistaken for pulmonary infarct, particularly if a mild dyspnea exists, which is elicited by elevation of the diaphragm. Knowledge of the possibility of the presence of a pneumoperitoneum after laparotomy will clarify the significance of certain postoperative sensations in the region of the thorax and shoulder and give reassurance as to their harmlessness.

**Gonadal Preparations for Diabetes Mellitus**—Diabetic disturbances frequently concur with disorders in the gonadal function. Saurer observed that, when gonadal preparations are administered to diabetic women passing through the menopause, not only do their menopausal symptoms improve but their carbohydrate metabolism is favorably influenced. She administered synthetic gonadal preparations to 17 patients with diabetes mellitus between the ages of 47 and 75. Men were treated with testosterone propionate and women with endocrine preparations of either sex. In cases in which regulation of menstruation is aimed at, estrogens are preferable, but in cases in which termination of the menopause is desired androgens may be given. In 15 cases medication with gonadal preparations was followed by an improvement in sugar tolerance. This was evidenced by a decrease in blood sugar values and by a lowering of the maximal elevation of the curves plotted from the results of oral dextrose tolerance tests (50 Gm by mouth). The simultaneous control of the excretion of sugar in the urine likewise revealed a decrease in most cases. The curves of insulin tolerance tests (10 units subcutaneously) usually were lower after the treatment. The intravenous tolerance tests (8 Gm of dextrose) resulted in almost normal curves. The carbohydrate metabolism of normal persons was not influenced by the administration of gonadal substances. There were no undesirable secondary effects. Cases exhibiting menopausal disturbances were improved by gonadal substances. In two cases abnormally high metabolic rates were reduced. High blood pressure, however, was never modified. The author suggests that gonadal hormones act on the carbohydrate metabolism of the diabetic probably by way of the anterior lobe of the pituitary. The gonadal substances are indicated particularly for diabetic patients of the menopausal age. In adolescent diabetic patients the action of hormones is not so well explained and undesirable secondary effects are possible. Oral medication of diabetes mellitus seems possible in some cases. Perlingual medication or perhaps implantation of crystals of the synthetic gonadal preparations are other possibilities in the future treatment of diabetes mellitus.

**Improvement of Carbohydrate Tolerance by Testosterone Propionate**—Feil reports a case in which symptoms of hypertrophy of the prostate had been present for two years and diabetes for fifteen years. When the patient, a man aged 63, was given injections of testosterone propionate to counteract the prostatic symptoms, it was found not only that the urinary disturbances were benefited but that the carbohydrate tolerance showed likewise a surprising improvement.

- \*Action of Vitamin K in Menorrhagia and Metrorrhagia R De—p 1009

**Action of Vitamin K in Menorrhagia and Metrorrhagia**—Dietz reports observations on 17 women with menorrhagia or metrorrhagia treated with vitamin K. So-called juvenile hemorrhages were present in 6 cases, in 5 of which good reaction occurred to vitamin K treatment in the first case, however, menorrhagia recurred during the following menstrual period but was again successfully combated with vitamin K. In the second group there were 7 cases of polymenorrhea, 6 of which reacted favorably and 1 did not. The third group comprised 4 women with metrorrhagia in all of whom vitamin K counteracted the hemorrhages. On each of the first two days the women were given an intramuscular injection of 10 mg of a vitamin K preparation, and this was followed by 2 tablets daily by mouth for five days. In view of the limited number of cases and of the fact that the prothrombin level was not determined, the remarkable effect (only one failure in 17 cases) justifies further trials with this method.

**Danger to Vulcanizers in Tire Repair Shops**—Humperdinck describes the procedure in tire repair shops and draws particular attention to the solvents and rubber solutions. These, as a rule, are specialties of different firms. Analysis of a rubber solution revealed 93 volumes per cent of aliphatic hydrocarbons and 7 volumes per cent of aromatic hydrocarbons. Another rubber solution was found to contain 67 volumes per cent of aliphatic and 37 volumes per cent of aromatic hydrocarbons. The solvents used were a special benzene, 90 per cent commercial benzene and pure benzene. The special benzene contains up to 14 per cent of aromatic hydrocarbon. 90 per cent commercial benzene contains from 80 to 85 per cent of benzene and benzene homologues (xylene and toluene). The author investigated 9 different tire repair shops in order to determine to what extent the vulcanizers and helpers are endangered by benzene in their contact with rubber and solvents. Although well developed chronic benzene poisoning was not encountered, workers most exposed to benzene exhibited predisposition to hemorrhages, a relative leukocytosis and high absolute lymphocyte values in addition to considerable subjective complaints. The investigation led to better results in shops using special benzene. The following recommendations were made for the protection of the workers: Special benzines should be used instead of benzene. The rooms should be suitable and the work should be properly arranged, the workers should be subjected to regular medical examinations, and care should be taken that the workers are adequately, particularly with regard to vitamin C, supplied.

## Book Notices

**The Treatment of Burns** By Henry N. Harkins M.S. M.D. 1911  
Associate Surgeon Henry Ford Hospital Detroit Cloth Price \$6.00  
Pp 437 with 117 illustrations Springfield Illinois C. Baltimore  
Charles C. Thomas Publisher 1942

Dr Harkins has written a remarkably good book on burns. In this monograph the author covers practically every phase of this difficult subject in a scholarly fashion. In correlating clinical practices with experimental studies he has reviewed the literature exhaustively. His discussions of the voluminous research and experimental work on burns are presented in an orderly and critical but impartial manner. The bibliography will be most valuable to any one interested in the study of burns. The author quotes from the literature so freely that the book is not always easy reading. The impartial reporting of apparently conflicting views of other authors may be confusing to some readers. There will, of course, be differences of opinion as to whether the author has always given credit and emphasis fairly in his surveys as to the progress of knowledge on this complex subject. This however does not impair the value of his book.

Part I discusses the burn and its effects giving an introduction followed by chapters on pathology, chemical changes, blood concentration, burn shock, the adrenal glands, fluid loss, the role of toxins, the role of bacteria, early complications of burns, Curling's ulcer and late complications of burns. In general, the discussions in this part of the book are excellent. The chapter on pathology is interesting and instructive as likewise are the chapters on shock, the role of the adrenal glands and the role of bacteria. The voluminous complications of burns are presented in an orderly manner. There is little to criticize. It does seem that more could be said in the chapter on blood chemical changes. These are extremely variable in burns, but there is evidence in the literature that many of these conflicting findings may be explained on the simple hypothesis that blood chemical changes in severe burns will vary depending on the amount and the character of the fluid given and how the patient is handling it. Strangely, the book gives no discussion of this important consideration. Similarly, the chapter on the role of fluid loss seems not to include all the recent advance in knowledge on disturbances of fluid balance in burns. Concerning the role of toxins the author discusses the well known fact that some patients, especially young children, whose burns do not appear dangerously extensive will die rapidly with a peculiar intoxication which for a want of a better term has been called "acute toxemia." Dr Harkins gives an excellent review of this problem, emphasizes the fact that modern therapy has not solved it, and leaves the subject open.

**Communicable Disease Nursing** By Theresa I. Lynch R.N. Ed.D.  
Instructor in Education New York University New York Cloth Price \$3.75  
Pp 678 with 161 illustrations St. Louis C.V. Mosby Company 1942

This substantial book is intended not only to present the technical phases of communicable disease nursing as taught and practiced today in modern hospitals but also to show the part the nurse may play in the community in aiding in the prevention and control of such disease. The author who was formerly director of instruction and then superintendent of nurses at the Willard Parker Hospital in New York City and who is now instructor of education at New York University has had a considerable teaching experience and has also apparently had the advantages of the advice and assistance of many well informed people in the preparation of this book. As a result, a book of much value has been achieved.

The six chapters of part I are devoted to general discussions which will help to orientate a nurse to the nursing of communicable diseases. Then follow chapters discussing some six or seven infectious diseases, brief discussions being given of the respective illnesses and more extended accounts of the nursing care. A useful chapter on home care follows together with a number of appendices and a glossary. Each chapter has an appended list of references usually textbooks. The volume is profusely illustrated with photographs largely of nursing procedures, almost redundantly so. For instance

there is a series of thirty-eight half page photographs of the Willard Parker Hospital nurses' gown technique a technique which has been changed in some details since these photographs were taken. Five colored plates are borrowed from other textbooks one supposed to illustrate the eruption of scarlet fever showing a most typical involvement of the face.

It is doubtful whether pupil nurses will find the descriptions of the diseases sufficiently informative for their needs so that the book will probably prove more valuable as a reference book than as a textbook. As is bound to occur in all new books a number of outdated items have crept in, such as the table on page 163 worked out by Park a number of years ago. In the glossary, the definition of virus as "any toxic agent capable of producing disease a micro organism or its toxin" is hardly acceptable. The infectious period of chickenpox is considered on page 137 as approximately two weeks although most public health authorities now believe it is not much longer than a week. On page 119 we read that, because Broadhurst's inclusion bodies are abundant even on the fourteenth day of the disease, carriers may play a part in measles transfer a statement that might well have been omitted. Throughout the paragraphs on differential diagnosis amount only to lists of possibly similar illnesses. On the whole however, the book is valuable and should be available to all student nurses.

**Surgery of the Ambulatory Patient** By L. Krazer Ferguson A.B. M.D. F.A.C.S. Lieut. Commander Medical Corps United States Naval Reserve. With a section on Fractures by Louis Kaplan A.B. M.D. F.A.C.S. Associate in Surgery University of Pennsylvania Philadelphia Cloth Price \$10 Pp 923 with 645 illustrations Philadelphia Mouton Street C. London J.B. Lippincott Company 1942

There has long been a need for a textbook on the treatment of surgical conditions in ambulatory patients. The need has now been fulfilled by this author in more than an adequate and satisfactory manner. On the basis of a large personal experience, he discusses thoroughly the surgical conditions most frequently encountered that can be treated in a physician's office or in an outpatient surgical clinic without hospitalizing the patient. The book is divided into three parts. The first part covers general surgical problems, principles and lesions such as equipment, anesthesia, infection, foreign bodies, preparation and conduct of operations, postoperative care, foreign bodies and the treatment of wounds. The second part deals with regional surgery. In this section are considered the common surgical conditions of the various parts of the body and the methods of their treatment. In the third part Dr. Louis Kaplan, the author's associate, excellently covers the subject of fractures and dislocations and their modern treatment. The book is written in clear language and is easy to read. It is concise yet contains a vast amount of useful and practical information. In the treatment of the various conditions the methods and techniques are described with distinct details. The steps leading to success as well as possible errors and dangers are pointed out. A large number of photographic reproductions, diagrams and line drawings enhance the clarity of the text. On the whole it is an excellent book which is a valuable addition to the surgical textbooks and literature. It is highly recommended for study and reference to the younger men and general practitioners for whom this work is intended.

**Perineopelvic Anatomy from the Proctologist's Viewpoint** By R. V. Gerschlager A.B. M.D. Adjunct Professor of Proctology New York Polytechnic Medical School and Hospital New York Cloth Price \$5 Pp 298 with 157 illustrations New York Telford Company 1941

This monograph on the anatomy of the perineum and pelvic organs is an attempt to provide a good anatomic background for clinical problems in this special field. The author feels that a more thorough understanding of the anatomy will lead to more rational and better therapy. The perineum including muscles and fascias are described and profusely illustrated by means of diagrams and dissections. The anatomy of the anus, rectum and sigmoid is illustrated in detail by the use of histologic and gross preparations. Some attempt is made to show the relationships between these structures and other environmental viscera, such as the reproductive organs but more stress could be placed on this relationship. The lymphatic nerve and blood vessel supply of the pelvic structures is well presented. This volume is a valuable addition to the library of the proctologist and gynecologist.

ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### ARSENICAL PREPARATIONS AND MALARIA

To the Editor—For years my associate and I have controlled malaria in syphilitic patients with the injection of neoarsphenamine. I had 1 patient with chronic malaria nonsyphilitic with a large spleen who had taken quinine for ten or twenty years with recurrent attacks which was cleared up by two intravenous injections of arsenicals. I have noticed in the literature all sorts of articles on the treatment of malaria with quinine but never any with the arsenicals. Is it possible that the treatment of malaria with arsenicals is not generally known to the profession?

M D California

ANSWER—For more than a quarter of a century physicians have tried arsenical preparations as antimalarials, especially for quinine resistant patients. All clinical authorities on the subject (American, British, Dutch, German, French) are agreed that arsenicals per se apparently have little, if any, plasmodicidal action even in benign tertian malaria for which these drugs have at times been enthusiastically advocated. The record has been similar with solution of potassium arsenite, sodium cacodylate, arsphenamine, acetarsone, neoarsphenamine and mapharsen. Arsenicals have proved entirely useless in quartan and falciparum malaria, but they have been reported to have malaricidal properties against the tertian parasite. In conjunction with cinchona derivatives or atabrine arsenicals have probably been useful adjuvants in providing clinical cure for patients suffering from chronic malaria.

As far as it is possible to provide an evaluation the efficacy of arsenicals in malaria is confined to their tonic action. Together with the feeding of absorbable iron to build up hemoglobin, adequate nourishment and a stimulating climate the administration of arsenicals in conservative amounts may help the patient to develop an adequate defense mechanism against the reservoirs of malaria parasites in the spleen, bone marrow and other centers not always reached by quinine or atabrine.

It may be concluded that the hopes that arsenicals might prove to be satisfactory alternatives for quinine in their direct action on the malaria parasites have not been fulfilled. Their action is adjuvant, and as such their usefulness should neither be minimized nor overrated.

### BRONCHIECTASIS

To the Editor—A white man aged 54 had a rib resection in 1916 for abscess of the right middle lobe. From the history I believe this also perforated into the bronchus. Since that time he has been well except for attacks of coughing which are accompanied by considerable sputum and bright blood. At present he has been coughing for about two months. The cough is productive mostly at night and blood is present almost all the time. Roentgenograms show no evidence of tuberculosis or other gross lesion. Sputum is negative for tubercle bacilli but is described as characteristic of bronchiectasis. One chest man feels that iodized oil should be injected and then roentgenograms taken. Another feels that this is contraindicated because of the probable diagnosis of bronchiectasis. Should this be done? Is bronchoscopy indicated? Your opinion will be appreciated.

M D New York

ANSWER—If one assumes that this patient had an abscess of the lung, it is reasonable to assume now that he has a bronchiectasis in the site of the former abscess. This is a common sequence of events, and this probability is strengthened by the fact that his coughing comes in attacks and that the roentgenograms do not show evidence of any gross lesion. Bronchiectasis is one of the few lung conditions which can produce symptoms without important x-ray apparatus. The only way of being sure of the diagnosis of bronchiectasis would be by taking roentgenograms after the injection of iodized oil into the affected area. This is a safe procedure and appears to be definitely indicated. Bronchography is routine in cases suggestive of bronchiectasis. The presence of blood in the sputum is common. In a man 54 years of age it always leads one to think of cancer. Occasionally cancer develops on the basis of some chronic bronchial or pulmonary disease although the long history and the absence of gross x-ray appearances are against cancer. A small intrabronchial lesion could conceivably be present. Bronchoscopy, on the other hand, is a safe and simple procedure and in this case would be of additional value

in determining precisely from which bronchial units the pus and blood come.

Operations are commonly performed on a mistaken diagnosis of lung abscess. This was much more common in 1916 than it is today. One of the common conditions mistaken for lung abscess is a localized empyema which has broken into the bronchus. If this fails to heal completely following drainage, the patient may continue to cough and expectorate pus from a small chronic empyema cavity for many years without showing any signs of sepsis. Other rare causes of chronic cough and expectoration are collections of pus beneath the diaphragm, either in the liver or in the subdiaphragmatic space, which have penetrated the diaphragm and broken into the lung. When this happens there are often no important pulmonary or pleural findings, and the conditions may become very chronic and persist for many years.

In this case bronchiectasis seems to be the most probable diagnosis. Bronchography is indicated and perhaps bronchoscopy. Both are likely to give important information, and neither is likely to do harm.

### RECURRING PLANTAR WARTS

To the Editor—I am a physician aged 29, I am in excellent health and have no complaints except plantar warts. Since 1938 when my warts started while I was a medical student I have been under active treatment by competent dermatologists. The first single wart was on my right heel and was treated with radium. It disappeared for several months and then returned. It was next treated with a massive dose of radium—so large a dose that a small piece of skin and tissue sloughed out. In 1939 the same wart returned—each one being the same "black seedy" type. While I was interning another dermatologist used roentgen rays repeatedly and the wart disappeared again, only to reappear a few months later but this time in a different place and almost a "crop." Another dermatologist recommended injections of a bismuth compound and another by mouth and this was tried for several months until my stomach revolted from the bismuth. This didn't help so for several months 20 per cent salicylic acid plasters were used without success. At the present time they have spread to the bottoms of both my feet and walking is becoming difficult. The dermatologist is now injecting a bismuth compound into the base of each wart and this also has been unsuccessful, in fact from my handling them I now have a wart on the margin of my thumbnail and I'm afraid that perhaps by cleaning my fingernails I'll spread warts to all my fingers. My dermatologist and I would greatly appreciate any other suggestions. M D Utah

ANSWER—Although the great majority of warts yield to comparatively mild treatment, histories such as this are heard too frequently for the complacency and self esteem of the dermatologist. In certain cases even after rigorous treatment such as the radium attack recorded in the query, or deep cauterization, the wart may recur. The reason for this great variation in susceptibility to treatment is not known. The thickness of the epidermis on the soles is one factor and perhaps the daily irritation of walking. Similarly incorrigible warts are encountered on the palms and on other parts with still thinner epidermis, but rarely. The new "almost a crop" during the internship was of course not a recurrence but the result of a new infection. This and the one on the thumb are evidence that insufficient precautions have been taken against autoinfection. In all manipulation of the infected areas, surgical precautions must be observed. Oozing of serum or blood from the warts should be avoided whenever possible, and if it does occur it should be regarded and treated as infectious. The results of such infections are very slow to appear, seldom being seen within a month and sometimes delaying for many months. Cleansing the thumb nail in the vicinity of the wart must be done with surgical precautions against infection, the instrument employed being sterilized before being used elsewhere. Picking at warts is strictly forbidden.

A recent contribution to the literature of the subject is by Karp and Frank (Electrosurgical Removal of Plantar Warts, *Arch Dermat & Syph* 45:328 [Feb] 1942), who use a specially small cutting loop, made by twisting a larger one until the loop is reduced to 2 mm in diameter and has a stem 8 mm long. Under procaine and epinephrine anesthesia, this is inserted into the sole so deeply that the loop is wholly buried, then it is rotated on its axis a half turn, 180 degrees and withdrawn through the linear cut of insertion. Surgical precautions against infection are observed. Bleeding is slight and pain is minimal, in fact, preexisting pain disappears in most cases. During the eleven years in which it has been in use, this method of treatment has succeeded in 19 of 21 cases. This percentage of success is about that of other methods. The exponents of this method acknowledge that their operation does not remove all infected material. The 2 cases in which it failed were previously treated by other methods without success. This is in accord with the failures after other methods of treatment.

In a case such as the one cited in the query, in which all methods have failed the chief desideratum is the comfort of

the patient. Protection against autoinfection is also important. Mild treatment, such as superficial cauterization once every week or two with reduction of the lesions enough to prevent pain from pressure, is just as likely to result in cure as energetic attacks, and much less likely to cause pain and incapacitation. Further irradiation with roentgen rays or radium should be avoided, certainly on the heel on which the severe reaction occurred.

If the patient can be kept comfortable and free from further infection, the warts may disappear at some time in the future.

### SALYRGAN IN ACUTE NEPHRITIS OF CHILDREN

*To the Editor*—A boy aged 4, with acute nephritis of two days' duration following a mild upper respiratory infection, developed edema of the eyelids, scrotum and lower extremities. There was marked ascites, vomiting, a temperature of 102 F and inability to flex the spine. The patient had a similar attack four months previously, at which time a twin brother afflicted with the same disease died. The patient was seen at 11 a. m. and was given ammonium chloride solution by mouth and 0.5 cc of salyrgan intravenously. The ampule of salyrgan was covered with cotton and placed on the table. The patient was seen again at 9 p. m., at which time stupor had disappeared, the swelling had slightly decreased and the patient appeared to be improved and was continuously requesting water. However, urine passed since the intravenous injection was less in amount than previously and contained a considerable amount of pus. The remainder of the ampule of salyrgan, which amounted to 1.5 cc, was given to the patient intravenously. Immediately after removal of the needle, the patient had a tonic convulsion and died. Epinephrine into the heart and artificial respiration with a mechanical resuscitator were of no avail. Postmortem showed the kidneys to have fetal lobulations and to be enlarged in size, the capsule stripped with great facility, the pelvis contained purulent exudate. The abdomen contained about 2 quarts of yellow ascitic fluid. Although salyrgan is contraindicated in acute nephritis, it was given in this case for the ascites. Did death result from an overdose of salyrgan, from some toxic quality of the salyrgan standing in an open ampule for nine hours, or because it was contraindicated in this type of disease? If death was due to salyrgan should its result be so immediate?

M D, Arizona

*ANSWER*—It is not possible to judge from the history given whether or not this patient actually had an acute hemorrhagic nephritis of the postinfectious type, as there was no mention made of blood in the urine. Assuming that it was that disease, however, one would not ordinarily expect salyrgan to be efficacious in its treatment. There are several cases reported in which this identical sequence of events has happened, namely, after one injection of salyrgan with no difficulty, a second or third injection caused death. As far as is known, death in such instances is due to sensitivity to the drug. The death probably did not result from an overdose of salyrgan, or from any toxic quality following standing. The contraindications to the drug in this type of disease are that it is ineffective and that it sometimes causes this sort of accident.

### HYPERTENSION AND INCREASED METABOLISM

*To the Editor*—An automobile mechanic aged 32 was turned down by the draft board because of high blood pressure. He had been working every day and did not know that he was sick. His height is 5 feet 10 inches (178 cm.) weight 231 pounds (105 Kg). He has not lost weight recently. His past history is negative except for a sickness in childhood which left a valvular lesion of the heart. The heart is well compensated and has never caused him any trouble. Blood pressure reading on an aneroid instrument was approximately 340 systolic and 160 diastolic. This was checked with two mercury instruments. A week later a reading of approximately 400/180 was obtained. Ten minutes after a dose of 1/100 grain (0.00065 Gm) of glyceryl trinitrate the reading was 280/115. The basal metabolic rate is plus 42. He eats and sleeps well. The urine is normal. There are no other symptoms of hyperthyroidism. I am attaching a newspaper clipping which the patient brought to my office for my opinion. I would like your comment on it, as well as your suggestions for the treatment of this patient. He is taking iodine and a vasodilator and is in bed.

D W Davis, M D, Akron, Ohio

*ANSWER*—The occurrence of an elevated basal metabolic rate with obesity is far more common than is generally realized, for the usual "textbook" picture of hyperthyroidism places weight loss among the most characteristic symptoms. Excessive food consumption is frequently secondary to the appetite stimulation of hyperthyroidism, if this exceeds the catabolic increase, weight is gained. Eating to excess also becomes a habit to quiet the nervous tension and apprehension too typical of the syndrome. Eating is a sedative. These overweight patients may or may not show hypertension. Rarely is the diastolic tension conspicuously elevated unless there is pre-existing or coincident hypertensive disease etiologically independent of the thyroid disorder. The response of the diastolic tension to vasodilatation with glyceryl trinitrate indicates that the hypertension is relatively recent or greater arteriolar

rigidity would have been observed. The one determination ten minutes after the administration of glyceryl trinitrate, does not necessarily reveal the full extent of the fall in pressure. Many and frequent postvasodilator determinations are necessary to be assured that the minimum diastolic tension has been actually observed. Such extreme variations in tension as are mentioned in the query suggest some acute vasodepressor causation.

Before it is possible to make sound therapeutic suggestions for this patient it is necessary that further diagnostic study be carried out. Repetition of a vasodilator test either with glyceryl trinitrate or with amyl nitrite (Stieglitz, E J. Evaluation of the Prognosis in Arterial Hypertension, *Arch. Int. Med.* 46:227 [Aug.] 1930) is indicated. Thorough study of the renal functional capacity, data on the blood picture, closer study of the heart and recheck of the basal metabolic rate are all needed. In view of the youth of the patient and the apparently adequate compensation of his heart, the possibility of coarctation of the aorta should be ruled out. This is readily accomplished by determining the arterial tension in the legs (popliteal fossae), a pressure lower in the legs than in the arms is pathognomonic of aortic coarctation. Unilateral renal disease with ureteral obstruction or polycystic kidneys may exist though a voided specimen of urine is "normal", further investigation of such a possibility should most certainly be undertaken. Despite the present absence of headaches and conspicuous neurologic symptoms, there remains the possibility of a brain tumor as a source of the hypertension. Because logical therapy to control must be highly individualistic and the program of management depends largely on specific etiologic factors, more thorough diagnostic study must precede formulation of treatment.

The therapeutic use of radioactive iodine, as mentioned in the newspaper clipping, is still purely experimental. Though this approach appears to offer some hope for the future in controlling certain metabolic disorders, it is far too early to venture predictions either as to its value or as to its hazard. Without adequate and careful control, administration of activated compounds is unwarranted. It is doubtful whether the elevated metabolism (as evidenced by a single uncorroborated determination) is a major etiologic factor in this patient's severe arterial hypertension. Adrenal neoplasm is a very rare but is a more probable cause than the hyperthyroidism.

### A PROBLEMATIC POST-TRAUMATIC CEREBRAL SYNDROME

*To the Editor*—Many varied symptom complexes follow brain injury. Recently a local Selective Service board was ordered by superior authority to classify a selectee as I-B (qualified for limited military service) because of "post-traumatic cerebral syndrome." I can find no reference to such a clinical entity in the medical literature at my command. I detailed physical and neurologic examination by four medical members and one dental member of the board failed to reveal any abnormal physical signs or symptoms. No evidence of psychoneurosis or psychosis was found. The man indulges in strenuous physical activity daily. He had a skull fracture in 1939 from which he apparently has recovered completely. He states that he is now sound and well. Please supply the available information.

Paul D. Luckey, M D, Connelleville, Pa.

*ANSWER*—By "post-traumatic cerebral syndrome" is usually meant a rather constant group of symptoms which infrequently follow craniocerebral injuries. The most prominent of these symptoms are headache and giddiness, which are frequently precipitated by physical exertion or by stress. In addition these patients are often irritable and complain that their memory is poor, that they are unable to concentrate and that use of their eyes, as for reading or in a motion picture show, produces a feeling of "eyestrain" and headaches.

The condition is largely subjective, and it is not uncommon for detailed physical and neurologic examinations to reveal no significant abnormalities. This condition has been described in two recent books (*Diagnosis and Treatment of Head Injuries* by S W Gross and William Ehrlich, New York: Paul Hoeber, 1940, and *Injuries of the Skull, Brain and Spinal Cord*, edited by Samuel Brock, Baltimore, William Wilkins Company, 1940).

It is difficult to understand how any one could have a diagnosis of "post-traumatic cerebral syndrome" or "post-traumatic syndrome" on a man who presented no symptoms of a syndrome but who, on the contrary, is "sound and well" and indulges in strenuous physical activity daily. The mere fact that he sustained a fracture of his skull in 1939 is not sufficient basis which to entertain such a diagnosis.

If the facts as stated in this inquiry are accurate and complete, the patient in question does not suffer from a post-traumatic cerebral syndrome.

## DRUGS FOR ARTHRITIS

To the Editor—I should like to have a fairly complete list of the drugs that are being used for the treatment of arthritis and an opinion as to the worth of each

M D Kansas

ANSWER—Scores of drugs are being used in the treatment of various types of arthritis. Many of them have little or no rationale. Some of them are designed to relieve pain others (for example sulfur vitamin) have been prescribed to correct some supposed (but unproved) deficiency still others (for example gold salts) are being used to kill some supposed (but unidentified) type of infection. The sulfonamides have been found to have no beneficial effect in cases of rheumatic fever or in rheumatoid arthritis or osteoarthritis. The use of sulfonamides should be confined to the treatment of the specific arthritides of known bacterial origin (gonorrheal, staphylococcal hemolytic streptococcus and so on). Vitamins in massive doses have not been proved to be of any notable value in cases of chronic arthritis, despite advertising balldhoo. Acetylsalicylic acid continues to be the safest and generally the most effective analgesic drug and should be prescribed fairly generously provided patients receiving it do not rely on it alone, thereby omitting other more important remedies. Opinions as to the use of gold salts for rheumatoid arthritis continue to differ notably. Some physicians of wide experience consider chrysotherapy the remedy of choice, others use it only when other remedies have failed still other physicians have concluded that its toxic reactions outweigh its therapeutic value. A synopsis of current opinions on the worth of these and many other drugs for arthritis and rheumatism will be found in the Eighth Rheumatism Review (*Ann Int Med* 15 1002 [Dec] 1941).

## AIRPLANE 'DOPE' AND ERYTHEMA NODOSUM

To the Editor—A woman aircraft worker aged 35 employed in painting dope on the wings of airplanes has had lesions characteristic of erythema nodosum for two weeks. This substance is applied by brushing. The lesions have been on the right hypothernar eminence both thighs and the midpretibial regions. Those on the hand and thighs have disappeared. The question has arisen whether or not this woman's occupation has anything to do with the skin condition. Certain drugs are known to cause similar lesions. So-called dural poisoning is common knowledge among the workers themselves. Do you have any explanation for this condition?

M D California

ANSWER—"Dope" consists of cellulose nitrate, solvents and plasticizers. The solvents when applied to the skin in sufficient quantity and for a sufficient length of time as they would be if the hands are continuously immersed in them, would cause dermatitis of the parts exposed but would not pick out one particular small area such as the right hypothernar eminence.

The U S Public Health Service has made a study of dermatitis among airplane workers (Schwartz, Louis and Russell John P. Skin Hazards in Airplane Manufacture *Pub Health Rep* 56 1581 [Aug 8] 1941 reprint 2300) and found that the name dural poisoning was applied by workers to an cutaneous disorder from which they suffered. Patch tests were performed with duralumin and with Dow metal. They were found to be nonirritating. It is common practice for workers to put the blame on their occupation for any cutaneous disorder which they may have for instance, rubber workers have rubber itch brass workers have brass itch and fur workers have fur itch. Schwartz and Russell describe all skin hazards in airplane manufacture as the result of examinations of workers and working conditions made in nine airplane factories. They do not state that any such condition was found such as that described.

## LEAD PENCIL MARKINGS ON FOOD PRODUCTS

To the Editor—What are the possible deleterious effects of the use of an indelible pencil in marking food products directly on the product itself? For instance if on a turnip the weight should be placed on the product and was not removed during the cooking process what if any ill effect is possible or probable? It you can I would like to have a formula of the ingredients used in the so called indelible lead.

Ralph H Wheeler M D Chicago

ANSWER—There are many formulas for the indelible lead of pencils a typical one being methyl violet 33 per cent graphites 47 per cent gum tragacanth 3 per cent and china clay 17 per cent. Practically all violet indelible pencils utilize methyl violet. For other colors such as red or yellow there may be employed magenta and aurimine as the pigment agent with other constituents remaining much the same. In the case of methyl violet it is well known that fairly serious injuries of the eye may result from puncture wounds or lacerations, but the quantity involved in the mere writing on food products is insignificant and negligible. This is equally true of other constituents men-

tioned regardless of their properties under other circumstances and in grossly larger quantities. It is well known that the governmental stamp of inspection on meats is done with methyl violet ink and this imprint is not necessarily removed prior to cooking. It is probable that this dye is otherwise used on food products under governmental sponsorship. While no harm is anticipated, this dye is not included in the list of coal tar dyes which are regarded as harmless and suitable for use in foods, drugs and cosmetics after certification as required by the Food, Drug and Cosmetic Act.

## PROBABLE RAGWEED DERMATITIS

To the Editor—A man aged 39 has had weeping dermatitis resembling eczema over his face and eyelids for eighteen years. This condition makes its appearance in early August and clears up with the first frost in the fall. He has some lacrimation and stuffiness in his nose. One summer and fall he was in the state of Washington and had complete relief from it. He does not have this condition in Canada either. He is a salesman on the road and works the southern half of Minnesota. I gave him a complete cutaneous testing routine using Bartos intradermal tests for foods and epidermols and also tested him with the powdered pollen extracts put up by R V Ellis of the University of Minnesota for hay fever (scratch tests). I also tested him for the ten common spores put up by the Abbott Laboratories (skin tests). Of all these he reacted only slightly (1 plus) to house dust and clam. He is anxious to find the offending substance. What further could you suggest in testing or treatment of this skin condition? In the other months of the year the patient's face is clear and the eruption occurs only on the face and eyelids when it does appear.

D E W Ellis M D Elgin Minn

ANSWER—This appears to be a plain case of ragweed dermatitis caused by pollen rather than by exposure to the plant itself. Evidence of this conclusion is the date of onset and termination of symptoms, also the fact that symptoms were absent in areas where ragweeds are absent.

None of the tests mentioned could be expected to give positive reactions because the affliction is caused by the oil (lipoid) fraction of the pollen rather than the water soluble portion, which causes whealing of the skin and symptoms of inhalant allergy. If lacrimation and stuffiness of the nose are synchronous with the dermal symptoms, the association would seem to be purely accidental. Successful diagnosis can be carried out only by twenty-four hour patch tests with ragweed oil (obtained by alcoholic or ether extraction of ragweed leaves or ragweed pollen).

## POSSIBLE ACHRESTIC ANEMIA

To the Editor—A woman with anemia that does not yield to iron by mouth to liver or iron injections or to rest and diet has been subjected to an exploration of the abdomen. Every abdominal organ was found to be normal. All tests were negative including the Wassermann. The blood picture is that of pernicious anemia but there is acid in the stomach. From my reading in the journals I would call this an achrestic anemia. May I ask the cause treatment and prognosis? I would appreciate a reply because the woman's blood is dropping rapidly her hemoglobin is 42 and the red cells number 2 150 000.

Mary L. Rosenstiel M D Freeport Ill

ANSWER—The "color index" is about 1 in this patient, so that the anemia is primarily not of the iron deficiency type. If the red blood cells have an average diameter of 7.5 microns, one should consider aplastic anemia or the anemia associated with chronic kidney disease. If the red blood cells are larger than normal cirrhosis of the liver or myxedema must be considered, although the former would no doubt have been noted at the operation. It is evidently not pernicious anemia. In true plastic anemia the bone marrow, obtained by sternal puncture would show but little cell growth. In chronic kidney disease the marrow would show active growth of the leukocytes but decreased growth of the red blood cells. In achrestic anemia the marrow would be hyperplastic. For treatment, blood transfusion appears to be indicated. The prognosis depends on the cause and it is more hopeful if this can be corrected.

## SOLIDIFIED CARBON DIOXIDE FOR CARCINOMA OF SKIN

To the Editor—1 I should like to ask whether carbon dioxide ice or snow is considered good therapy and if it actually destroys basal cell malignant growths if the lesion is small, i. e., by a freezing cauterization of the lesion. Are there any reports of such permanent cures of actual basal malignant growths as proved by biopsy? I have seen it used by others with apparent good results. I have used it myself, apparently successfully, on small cutaneous horns and types of benign epitheliomas. I might ask parenthetically whether it has ever been used successfully on small epidermoids. What could be considered medical uses of carbon dioxide snow or ice? 2 Would you discuss the best therapy for Bowen's disease.

M. C. Hanson, M.D., Loveland, Colo.

ANSWER—1 Solidified carbon dioxide may be used in some types of small superficial basal cell epitheliomas, though it is not recommended for such use. It is much more effective for removing the keratosis which often precedes the formation of cutaneous horns and some epitheliomas. Other uses for solidified carbon dioxide include the treatment of hemangiomas, some kinds of hairy and pigmented nevi and some telangiectases.

2 Bowen's disease is an intraepidermal carcinoma. It should be treated as a definite form of malignant growth of the skin. Each dermatologist favors some method, each method properly used and chosen for the peculiar circumstance gives comparable results. In each method the entire growth should be removed. It does not make a great deal of difference in the end whether the method is surgical, radiologic or combinations, provided the entire growth is removed. Of course, certain methods are more suitable in one circumstance or another and this is a matter of judgment in each case.

## CONSTRICTION IN THE FIELDS OF VISION FOLLOWING NEOARSPHENAMINE THERAPY

To the Editor—In routine work on the perimeter with patients who have syphilis and are taking neoarsphenamine I find that the field becomes very narrow. Will you tell me where I can get data showing this to be true and the treatment to restore the field to normality? The patients have no papillitis, the arteries and veins are normal, the retina is normal, the macula and fovea are well seen, the media are perfectly clear and there are no corneal opacities, in fact, the fundus is normal in every respect. The patients had a normal field before the arsenic treatment.

R. Marshall Faver, M.D., Miami, Fla.

ANSWER—It is not the usual thing to find constriction in the fields following the use of neoarsphenamine by patients who originally had normal fields and vision before treatment was started. Unless the patient is susceptible to arsenic or there is already an optic atrophy present, neoarsphenamine should have no effect on the eye or the visual fields. The conditions described are apparently normal though the color of the disks is not mentioned. It may be that there was a beginning optic atrophy.

We know of no publication concerning peripheral fields before and after neoarsphenamine in normal eyes. Any limitation of fields is a definite contraindication to the use of any pentavalent arsenicals, and some authorities say any arsenicals. These patients are usually given malaria or other form of fever therapy. Certainly the drug should be stopped immediately if there should be any constriction of the field of vision, as this is a definite indication of neurosyphilis involving the optic nerve. Fever therapy should be resorted to under these circumstances.

## LOSS OF WEIGHT AND OCCUPATION

To the Editor—A white man aged 40 complains of a loss of weight of 14 pounds (6.4 Kg.) in the past six weeks. Six weeks ago he began to work in a chemical laboratory with crystal urea, formaldehyde, rayon cellulose acetate and various dyes, of which some are vegetable and some are aniline. These chemicals are processed so that the resulting product is a fine powder. He is exposed to this powder at frequent intervals. His appetite has not been affected and his mode of living has not changed. Can the loss of weight be associated with the exposure to these chemicals? Physical examination is essentially negative.

M.D., New Jersey

ANSWER—Any reply to this query must be accepted as speculative. In any active laboratory the number of potential exposures always is greater than shown in a casual list such as is here furnished. Loss of weight is associated with many occupational diseases as from dinitrophenol or carbon bisulfide. Urea in large doses (4 Gm. three times a day) will induce weight loss through dehydration, but this degree of intake in a laboratory may not be expected. The diagnostic dictum "Always doubt the significance of a single manifestation" applies particularly to occupational diseases, including the present instance. Loss of weight from industrial substances ordinarily will not arise as the exclusive feature of injury. If

dinitrophenol, common to many laboratories that process dyes, might be assumed to be the cause of weight loss, damage to the liver and nervous system or evidences of other injury will coincide with diminution of weight. If loss of weight is other than from apprehension over a new job or from hard work at a new job, full examinations should be made as to possible incipient psychosis, toxic goiter, neoplasm or infectious processes. So far, from the information at hand there is no basis for any linkage with occupation.

## RESUSPENDED ERYTHROCYTES FOR TRANSFUSION

To the Editor—In Red Cross blood banks red blood cells remain after the plasma has been removed from the whole blood by centrifuging. If the latter should be diluted with isotonic solution of sodium chloride could this mixture be used for transfusion purposes in cases in which there is a definite indication for red blood cells? Would it be of any value?

Colman Lopatin, M.D., New Haven, Conn.

ANSWER—Erythrocytes separated by centrifugation of whole blood for the preparation of plasma can be used for transfusion, for example, in anemia, provided certain precautions are taken. First of all, the cells must be used not too long after the blood is drawn, since after storage for a week or longer in citrate solution the survival time of the transfused erythrocytes in the patient's circulation is considerably reduced. Second, the blood samples must be centrifuged individually, because pooling bloods of different groups, as is done by some workers, for example J. M. Hill and E. E. Muirhead, in order to absorb out the isoagglutinins, renders the red blood cells unsuitable for use. Finally, when the erythrocytes and plasma are separated, care must be taken that the centrifugation is not carried out at too high a speed or for too long a time, since excessive packing of the cells damages them and renders them unsuitable for transfusion.

## HEMOGLOBIN PREPARATIONS

To the Editor—I would appreciate references to confirm my opinion that hemoglobin preparations are of little or no value in the treatment of anemias.

M.D., Mexico City, Mexico

ANSWER—Truly "organic iron," combined with heme, is not available for hemoglobin production, as it is not released by peptic or tryptic digestion (Best, C. H., and Taylor, N. B. *The Physiological Basis of Medical Practice*, ed. 2, Baltimore: William Wood & Co., 1939, p. 94). Organic iron compounds of the type of hemoglobin are without pharmacodynamic effect (Starkenstein, E. *Die derzeitigen pharmakologischen Grundlagen einer rationalen Eisentherapie*, *MWchnschr.* 7:217 [Jan. 29] 267, [Feb. 5] 1928). After the ingestion of hemoglobin, the iron containing constituents can be recovered quantitatively in the stools (Haurowitz, F. D. *Abbau des Blutfarbstoffes im Verdauungstrakt des gesunden Menschen*, *Arch. f. Verdauungschr.* 50:33 [Aug.] 1931).

## SENSITIVITY TO DUST AND VACUUM CLEANERS

To the Editor—In the issue of May 23, 1942, in answer to the query concerning vacuum cleaners for dust sensitive people, permit me to call to your attention the fact that the cleaner named "Rexair" permits little or no dust dispersion, as the air intake is passed through a small tank of water. We have one in my own home, and no matter how frequently it is used and fresh water put in each time, the water is a thick sludge after each using. I do not know whether this machine is still being produced or on the market, but I assure you that for persons sensitive to dust it is most useful.

Frederick A. Stenbuck, M.D., Mount Vernon, N. Y.

To the Editor—Regarding the query in *Queries and Minor Notes*, May 2, entitled "Sensitivity To Dust and Vacuum Cleaners," by a New York M.D. I would suggest the "Rexair" cleaner, made by Rexair, Inc., 1023 First Building, Detroit. The machine contains water in its base and all dust is collected in it, the machine doing several duties, cleaning and conditioning at the same time. It draws all dust particles from the vicinity of the cleaner. Pine oil can also be added to the water to give a pleasant pine odor to the rooms being cleaned.

Frederick William Meng, M.D., Philadelphia, Pa.

## ABORTING A COLD

To the Editor—Referring to the query published in *The Journal*, April 12, concerning the aborting of a cold, I would state that according to my own experience, which I repeatedly had a chance to corroborate in a laboratory experiment during last year, an incipient coryza can be aborted by the use of iodoform powder as a snuff. Leo I. Holloy, M.D., Fort Belvoir, Wash.

## WHAT'S WRONG WITH MODERN THERAPEUTICS?

CHAIRMAN'S ADDRESS

WALLACE M. YATER, M.D.

WASHINGTON, D. C.

Is anything wrong with modern therapeutics, that is, with therapeutics as practiced today? There is no question of a tremendous improvement in methods of treatment since the turn of the century, the result of the remarkable progress made in the so-called medical sciences and the great elevation in standards of medical education. There is, of course, much to be learned, since there are still many diseases the cause and cure of which remain unknown, and improvement in the treatment of many of the other diseases is possible. What I am concerned with now, however, is whether it is not possible to better the work we are doing with the present knowledge we have. Periodic self-examination is worth while, even though it exposes defects one may not be proud of. Such examination has revealed many shortcomings, some of which I shall discuss together with their causes.

In the first place, as to the causes, our interns are thrown early into contact in many hospitals with busy and older practitioners who have developed their idiosyncrasies of therapeutics. Interns often adopt their peculiarities of practice and their pet and often empirical prescriptions, forgetting or abandoning some of the fundamentals of therapeutics they were so carefully taught in medical school. I have often observed interns ordering polypharmaceutic prescriptions that I know they never learned in school. They seem quickly to forget such things as that digitalis should be used only for congestive heart failure and certain arrhythmias and that "tonic" doses are of no value. Usually such things are the result of imitation of the bad practice of older men.

In the second place, practitioners often finally become so busy that they do not keep abreast of therapeutic advances published in good medical journals or do not properly evaluate them and eventually come to rely on advertising matter for their therapeutic knowledge. Fortunately the better pharmaceutical manufacturers are now rather careful about their claims and no great harm is done. However, some preparations are still being recommended for almost every ailment, from athlete's foot to nervous dyspepsia. When one considers the rapid advances in treatment, there is little wonder at the bewilderment of the busy and tired practitioner over conflicting reports and varying opinions. In one issue

of a journal one may read of the great value of a treatment, in the next issue of its lack of value. The periodic reviews of the literature on certain diseases or groups of diseases that appear in some journals are excellent for orientating the practitioner but unfortunately they are often not read by those who need them most. Also the reports of the Council on Pharmacy and Chemistry of the American Medical Association are excellent summaries of the known value of new remedies. Private practitioners should wait for these reviews before using new drugs or new forms of treatment.

In the third place, patients force physicians to prescribe many remedies which they have heard of or read about even though they may not be indicated. This is particularly true of vitamins, endocrine products and so-called tonics. Many of my own patients have asked "Doctor, wouldn't vitamin B help me?" and I must confess that at times I have replied "Possibly, at least it wouldn't hurt you", usually the patient has decided he would like to try it.

### SOME OF OUR SPECIFIC FAILINGS

With regard to the use of those preparations that require laboratory control tests for proper use, such as the sulfonamides, thiocyanate and thyroid I have found two large schools of practitioners: those who neglect the laboratory controls and those who use them excessively. There is, of course, a smaller middle group who use them properly. With regard to those physicians who neglect to use proper controls, I am not certain whether it is because they do not realize the necessity for them, whether they are trying to save expense for their patients or whether they merely practice medicine in a slovenly manner.

Many prescriptions are still written mainly for placebos. The day of the placebo is past. General intelligence is such that I consider it unfair and improper to present the patient with a prescription for a remedy simply to appease him and delude him into the belief that a mysterious drug or compound will cure him when such is not the case. I do not mean by this that nerve sedatives are taboo. They have a definite and important place in medical practice, but when used they should be proffered as a crutch to tide the patient over a difficult period, and this fact should be frankly explained. Their continued use otherwise is an insult to the intelligence of the patient and an indication that the physician hasn't either the time or the wisdom to treat the patient psychotherapeutically. Frankness is essential in modern medical practice, and far better results are obtained thereby.

Many prescriptions are still written in Latin. Although educated in a period when a great deal of Latin and a modicum at least of Greek were considered

essential to the preparation for the study of medicine, I believe the day has passed when Latin should be used in prescription writing simply to keep the contents of the prescription a secret from the patient. The patient should know what he is getting. The psychologic value of the mysterious today is not great. For that matter, however, the commonly used chemical names are sufficiently mystifying. To some it no doubt is heresy for me to state my belief that all prescriptions should be written in plain English, and I fear my old Latin teacher, Percival Padgett, is writhing in his grave at this very moment. Furthermore, the names and amounts of simple sedatives and hypnotics should be written on the labels of the containers in order that the patient may be sure what he is taking when he opens the container. It seems senseless to me that boxes and bottles of costly drugs should accumulate in the medicine chest and be of no value later because their contents are unknown. Often drugs are duplicated in this way. At times they may be taken by mistake.

Our double system of weights and measures for prescriptions remains a serious flaw in modern therapeutics. Something must be done about it. Recently a prominent man in my community met death because a prescription written in one system was filled by a "reliable" pharmacist in the other system, and the patient received fifteen times the dose intended. The same remarks apply to the double system of centigrade and fahrenheit methods of recording temperature.

The frequent introduction of some new sedative or hypnotic to swell the already large number of closely related drugs has added confusion but no great harm. Barbitol derivatives constitute the large majority of these drugs. An important question is whether physicians are prescribing them too freely. It was certainly an important step forward that was made when restrictions on their use were established. Drugs with such potentialities for harm should certainly not be dispensed except on order of a physician. Such restriction often inconveniences the busy doctor whose patients are forever phoning him for new prescriptions, but the necessity of prescribing anew makes him think of the advisability of allowing the patient to continue the use of the drug indefinitely. There is no question of the great value of these drugs when used to tide the patient over a difficult period.

I have often wondered whether the danger of chronic addiction to these drugs has not been exaggerated. My own experience of their administration to hundreds of patients has revealed very few who have desired to continue their use beyond the time I prescribed. Most of them have themselves discontinued using the drug before I suggested it. As to the question of the increasing use of these drugs for suicidal purposes, that is not so much a problem of the promiscuous prescription of the drugs as it is of the trend of modern living and of our failure to treat potential suicides properly.

In this connection I believe our greatest failure has been in the realm of psychotherapy. Most practitioners appear to be too busy not only to learn this important form of treatment in a scientific way but to practice any but the most desultory form of psychotherapy, depending on the old witch doctor's methods of incantation and mysticism. Hence the multiplicity of sedatives prescribed. Psychoanalysis is out of the question, of course, and perhaps it is just as well, but a form of practical therapeutics, which often is sufficient, could readily be mastered by any intelligent doctor. The

day of pure symptomatic treatment has passed. Intelligent explanation combined with the frank and judicious use of drugs should be the order of the day.

Not all the blame for faulty therapeutics can be placed at the physician's door, however. There still remain the dishonest advertising, the well meaning but often erroneous and falsely hope raising newspaper articles, and the great amount of self medication. I believe that the advertising of drugs and treatments should be subjected to the severest censorship. I believe that news articles of therapeutic discoveries should be most cautiously portrayed and that news stories of medical subjects should be of the simplest nature. Such reform naturally will be difficult of attainment. As far as self medication is concerned, that also cannot easily be eliminated except by means of public education. Fortunately, today most self medication is relatively harmless except as it may cause delay of proper treatment.

Few realize the extent of self medication. According to *Drug Trade News*, June 2, 1941, of total drug sales for 1940 (\$1,612,000,000), only 13.9 per cent of the total drug sales (\$225,022,143) were sold on prescription. A somewhat similar percentage holds true for other years. As far as vitamins alone are concerned, however, according to Dr. W. H. Sebrell of the National Institute of Health, about 50 per cent of the retail sales value of vitamin preparations are sold on physicians' prescriptions. According to the same source, the retail sales value of vitamin prescriptions amounted to approximately \$50,000,000 in 1937 and \$100,000,000 in 1938. It appears that the vitamin business has almost doubled every year since 1937. How much of this expenditure is justified?

The vitamin problem is an important one, since both the profession and the public are being educated to believe that practically everybody suffers from vitamin deficiency. That being the case, vitamin preparations are prescribed for almost every complaint. This is understandable, because patients have so many bizarre and functional complaints, because physicians are taught there are so many cases of subclinical vitamin deficiency and because it is only natural that those who spring eternal for a panacea for all ailments that the human flesh is heir to. Until more definite indications for the use of vitamins are established, we must expect their increasingly inordinate use.

The endocrines are also greatly abused, especially in female patients, for much the same reasons. This abuse will continue until physicians are convinced that there are at present only a few definite indications for their administration.

The use of iron is also overdone, and some physicians are still giving it parenterally. Many expensive combinations of iron, liver and other preparations, including vitamins, are being prescribed ad libitum and have taken the place of many old fashioned tonics such as those of iron, quinine and strychnine. The so called adjuvants, such as potassium iodide, have been practically abandoned except when proper indications exist.

The use of a multiplicity of drugs prevents appraisal of their use in cases in which a therapeutic test might be of diagnostic value. I have observed this even in a teaching hospital, for instance, both in liver have been used from the start in cases of pernicious anemia in which it was not at once clear whether it was pernicious anemia or an iron deficiency anemia.

I never could understand why so many physicians appear to be wary of treating patients with

mellitus since it is such a common disease and we know how to treat it so exactly. Perhaps the fault lies in our teaching. Perhaps we make the subject too complicated, in fact I believe that we scare our students by individualizing the diets too much a thing that is desirable of course, but not necessary. If they understand that the diet formula in all but the mildest cases should be constant from day to day as long as there is no complication and should therefore be measured the problem of diet is a simple one. If for adults a basic diet is adopted of, say 225 or 250 Gm of carbohydrate and 75 Gm of protein, then the remainder of the calories thought desirable could be made up with fat. After that the number of units of protamine zinc insulin necessary can easily be determined by taking two-thirds the average number of grams of dextrose excreted in the urine in twenty-four hours. Such simple rules will be adequate for the majority of patients, although more exact methods are advisable and easily acquired. One still sees physicians using some oral form of insulin, or using insulin without reference to a measured diet or making the statement that because a patient has diabetes he is a poor operative risk. Let us hope that these fallacies will eventually die out.

Fads and fallacies in the realm of dietetics are legion. The most common ones are those concerned with weight reduction, hypertension, arthritis and chronic gallbladder disease. Such fads are remnants of old superstitions combined often with the ingenuity of laymen who have something to sell. Weight reduction requires not only a low calory diet of as near normal content as possible with the addition of calcium and the fat soluble vitamins in which such a diet is deficient, but a maintenance diet of relatively low caloric content after the desired amount of weight has been lost. The elimination of red meat from the diet of patients with hypertension not only is not necessary but often makes the patient unhappy. There is no diet that will alleviate the symptoms of nongouty arthritis. The elimination of all foods of high fat content for patients with chronic gallbladder disease is unwise since uncooked fats such as butter and cream, are well tolerated and contain the important vitamins A and D.

#### PHYSICAL THERAPY

A few words concerning physical therapy may be apropos. This important form of therapeutics is slowly coming into its own and is gradually being wrested from the cultists. Even so, many physicians still do not appreciate the importance of physical medicine as a daily therapeutic aid in such conditions as atrophic arthritis and peripheral vascular diseases. With regard to the latter, simple home methods of physical therapy are the most important therapeutic modalities.

#### THE COST OF THERAPEUTICS

There remains finally the question of the cost of therapeutics to the patient. To consider only one phase, that of drugs, there is great room for improvement. I speak only from a knowledge of what my own patients pay for drugs. The cost of the simplest preparations is often astounding, and I know that many times the cost of the medicine is more than the physician's fee. Here is a sad state of affairs and one that the individual physician is powerless to remedy except so far as he may prescribe the simplest and least expensive preparations of similar action and therapeutic value. No one will gainsay the druggist a fair profit, but patients often wonder if the profit is fair.

#### CONCLUSION

What's wrong with modern therapeutics goes back to the source of most failures, namely lack of knowledge and the weaknesses of human nature. That being the case it will be many a day before most of our shortcomings in the field of therapeutics will be remedied. In the meanwhile, more and better education of both medical men and the public will shorten the time to the therapeutic millennium.

### EDUCATIONAL NEEDS IN THE FIELD OF INDUSTRIAL HEALTH

WITH EMPHASIS ON MEDICAL POSTGRADUATE  
INSTRUCTION

LEVERETT D. BRISTOL, M.D., DR.P.H.

Chairman, Committee on Education, Council on Industrial Health,  
American Medical Association

NEW YORK

Educational needs in the field of industrial health may be considered from three standpoints: (1) the education of the worker himself with reference to his health; (2) the education of management and labor as to the needs and values of health and medical work in industry; and (3) the education of those who render professional services to industry, particularly the medical practitioner or specialist. In this presentation I shall refer only to the last mentioned, with emphasis on postgraduate education.

The Council on Industrial Health of the American Medical Association has expressed its willingness to assist in the development of intensive training in industrial health for full time and part time industrial physicians through its organization of committees on industrial health in state medical societies. The Council already has acquired information on all major medical agencies interested in employee health and the available facilities for undergraduate and postgraduate industrial medical training in the United States, as well as other data of potential value in an industrial health program as a part of our wartime efforts. Speaking as a member of the Council, which is a standing committee of the Board of Trustees of the American Medical Association, I welcome the cooperation of the Associated State Postgraduate Committees of the State Medical Societies in all matters pertaining to the advance of postgraduate industrial medical education in the United States. I particularly would emphasize the value of cooperative relationships of committees (a) on industrial health and (b) on postgraduate medical education in the state medical societies.

#### WARTIME NEEDS

There are approximately fifty million wage earners in the United States. Among these workers it has been found that over four hundred million days are lost yearly on account of absenteeism due to sickness, with a resulting yearly cost of over three billion dollars. We must do everything possible to save this time lost from sickness as a part of our contribution to winning the war. Neither metal nor rubber, money nor manpower but time shows the greatest shortage! Our present needs require a strengthening and broadening of the

entire industrial health program all along the line from private industry to local, state and federal jurisdictions. As emphasized by Surgeon General Parran of the United States Public Health Service, "Industrial hygiene must keep pace with the needs arising from high speed assembly lines, which will employ some fifteen million men and women within the year. Great Britain learned that it is urgently necessary to have the full time services of a trained industrial physician in every large plant. Less than one seventh of our workers have that service now."

As a further indication of the need for promoting more adequate health services for wartime workers is the fact that in 1941 there was a 12 per cent increase in disabling cases of sickness and nonindustrial injuries among male employees of various industries as compared with the mean for the last ten years. Lost time from work on account of sickness, under present conditions, is a potential form of unintentional sabotage. This hidden waste must be brought under better control as a part of our war efforts. As recently stated by Mr. Paul V. McNutt, "Although modern warfare depends on industry just as much as on armed forces, measures to maintain the health and morale of defense workers are far inferior." Moreover, it has been said that, "in time of peace, industrial hygiene is a tool, in time of war, we must make it a weapon!"

One of the chief and immediate needs in connection with the national emergency calls not only for more and better undergraduate instruction in industrial health in our medical schools but also for the organization of short postgraduate courses or institutes in strategic centers throughout the United States. One result of the advance in the development of bureaus of industrial hygiene in state and local governments has been an increased demand for trained personnel which it has been difficult to meet. Many war production industries also are finding it difficult to obtain the services of properly qualified medical personnel. With the practical exhaustion of the supply of competent industrial physicians, we must depend largely on physicians active in community practice.

#### RECENT DEVELOPMENTS

During the past few years, industry has been making more and more use of medical knowledge and service. Some of the larger companies recently have enlarged their employee health programs, also it is now being recognized that health supervision and medical services for employees of smaller plants and business concerns should be further developed, particularly in war production industries.

One of the most significant recent developments in relation to the organized interest of business management in the health of the worker was the creation of an Advisory Health Committee of the Insurance Department of the Chamber of Commerce of the United States, which held its first meeting in March 1942. This committee will consider the possible development of an industrial health program to be carried on by the chamber in cooperation with affiliated trade associations. It represents a broadening of the health work of the chamber, which for many years has promoted more adequate city and rural health administration through annual interchamber health conservation contests.

Prior to 1936 there were in the United States only five state departments of health and two or three state

departments of labor conducting industrial hygiene activities, and even these activities were of limited nature. As of 1942, a total of thirty-six state, four city, two county and two territorial industrial hygiene bureaus have been established, mostly in departments of health.

All these recent developments will require larger numbers of physicians adequately trained for work in the field of industrial health. Many of the state medical societies have been increasing their activities in this direction through the creation of committees on industrial health, which are cooperating closely with the Council on Industrial Health of the American Medical Association.

#### TEACHING OF INDUSTRIAL HEALTH

As compared with the rapid developments in the organization of industrial medical and health activities in various industries and official departments of health there has been a definite lag in the teaching of industrial health in our educational institutions. In a study<sup>1</sup> which I made in 1934 it was found that only thirteen of eighty-five medical and public health schools in the United States and Canada gave separate courses on industrial hygiene or industrial medicine. Several medical schools included one or two lectures on this subject in their general course on preventive medicine and public health, while a majority of such schools gave no attention whatever to this important and growing subject. Thus a wide range of practice in the teaching of industrial health has been followed among various medical and public health schools. Some advances have been made during the past few years. As indicated by Seeger,<sup>2</sup> a review of this subject by the Council on Industrial Health in 1938 showed that fifty-two medical schools reporting some attention to the subject averaged five hours of instruction on industrial health in their four year curriculums. A more recent study shows a further slight increase in the number of hours devoted to this subject. It is hoped that added impetus will be given by (a) the teaching syllabus and (b) the recently developed outline on the Teaching of Industrial Health, prepared by the Council. A few medical schools recently have established short courses in industrial health for local community groups. These have been organized either independently by the medical school or in cooperation with local industries, state bureaus of industrial health and other public agencies.

As of interest in the field of education in industrial health was the creation in 1941 of a joint committee made up of representatives of (a) the American Association of Industrial Physicians and Surgeons and (b) the Section on Preventive and Industrial Medicine and Public Health of the American Medical Association to consider and possibly to draw up a plan for certifying industrial practitioners. Based on regulations governing the organization of certifying boards already laid down by the Council on Medical Education and Hospitals of the American Medical Association and the Advisory Board for Medical Specialties, it is hoped that eventually an American Board for Industrial Practice may be created and become operative.

The Council on Industrial Health of the American Medical Association recently published a report<sup>3</sup>

<sup>1</sup> Bristol, L. D. The Teaching of Industrial Health. J. A. M. A. 990 995 (March 31) 1934.  
<sup>2</sup> Seeger, S. J. Education in Industrial Health. J. A. M. A. 1017 1019 (March 21) 1942.

**Teaching of Industrial Health**<sup>3</sup> This report, prepared jointly by committees representing the American Association of Industrial Physicians and Surgeons and the Council includes an outline of a course of instruction based on the three major constituents of medical service to employed groups, namely (1) industrial health administration, (2) industrial hygiene and toxicology and (3) industrial medicine and traumatic surgery. This outline, while intended primarily for undergraduate teaching can be used with suitable modifications for the organization of continuation or postgraduate study either of the introductory or of the refresher type under (a) medical society or (b) medical school sponsorship or both. The underlying arguments for improved teaching of the essential factors in industrial health have been submitted to the Council on Medical Education and Hospitals, which in turn has acknowledged the urgent necessity for calling existing deficiencies strongly to the attention of medical educators and the profession at large, and for the submission of suitable recommendations aimed at their correction.

#### POSTGRADUATE INSTRUCTION

A well rounded plan for the teaching of industrial health involves (a) medical undergraduate teaching, including required and elective courses, (b) postgraduate instruction or continuation study, including opportunities for practicing physicians to attend organized classes or brief refresher courses or institutes and (c) extended graduate study intended particularly to prepare physicians for full time specialty practice in industrial health. While undergraduate teaching and extended graduate study in industrial health are best carried on by university medical departments, postgraduate continuation study lends itself particularly well to the leadership and administration of state, county and local medical societies, with the cooperation of official health agencies. In the further development of adequate medical training in industrial health, priorities should be assigned at this time to postgraduate instruction for practitioners of medicine as an urgently needed wartime program. As far as possible, this should not be allowed to decrease our efforts to provide more and better undergraduate instruction on this subject in our medical schools.

Depending somewhat on the length of time available and on local conditions and facilities, the content of a postgraduate course, continuation study or institute in industrial health should cover (1) employee relations, (2) management relations, (3) medical relations and (4) public health relations. The first two involve the demand or need for industrial health services, the last two the supply of such services. Among the specific subjects which should be included are (a) common industrial health problems, including dust hazards, industrial dermatitis and other industrial diseases of local bearing or interest, (b) control of tuberculosis, syphilis and other nonoccupational diseases among industrial workers, (c) emergency care of major and minor industrial injuries, (d) the industrial hygiene survey with demonstrations of methods and apparatus, (e) medicolegal aspects of industrial health and (f) industrial health and the general practitioner, including methods and procedures regarding administration and physical examinations.

One of the outstanding examples of postgraduate education in industrial health is that which was carried on last year through brief regional institutes in nine Iowa communities based on cooperative efforts between the state and county medical societies and the state department of health. About twelve hundred physicians attended these institutes the purpose of which was to stimulate and correlate the interests in industrial medicine of general practitioners, industrial physicians and industrial managers. Details of this successful series of educational institutes on industrial health are given in an editorial of *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*.<sup>4</sup>

According to recent information supplied by the secretary of the Council on Industrial Health based on a questionnaire to state medical societies out of thirty-seven states reporting to date, programs of postgraduate education have been developed covering (a) industrial medicine and surgery in nine states, (b) industrial hygiene and occupational disease control in eleven states, and (c) medical organization in industry in seven states. In fourteen states, relationships have been established between state committees on industrial health and committees on postgraduate medical education. Thirteen state societies have sections on industrial health in their scientific assemblies. In nine state societies educational services have been developed through county medical societies and in ten states such educational services have been organized through state medical journals. Ten state societies have arranged for exhibit material on industrial health at their annual meetings, and in seventeen states papers on industrial health subjects are included in current programs of state medical society meetings. From these figures it is evident that in the United States we at present are doing very much less than we might be doing in postgraduate medical education in industrial health. May we not accept this as a challenge to greater efforts and accomplishment in this important field so vital to winning the war?

Quoting the federal director of Defense Health and Welfare Services, "Of all defense health and welfare services, industrial hygiene can make—must make—the most direct contribution to winning the war. As in modern warfare, the strategy of industrial health service is team work." It would seem logical, therefore, to do everything possible better to prepare medical students and practitioners of medicine for leadership in industrial health through more adequate undergraduate and postgraduate instruction. Our objectives in the teaching of industrial health may best be attained through active team work of medical schools and organized medical societies, particularly of postgraduate and industrial health committees of the latter, in cooperation with the Council on Medical Education and Hospitals and the Council on Industrial Health of the American Medical Association and the Associated State Postgraduate Committees of the state medical societies. A 33 per cent or even a 50 per cent performance in any field is not conducive to winning this war. Immediate steps should be taken to stimulate and implement a complete, well integrated program of postgraduate medical education on industrial health at a high administrative level.

## BASAL TEMPERATURE VERSUS BASAL METABOLISM

BRODA BARNES, M.D.  
DENVER

Basal temperature is defined here as the body temperature taken under conditions which are usually considered as necessary for determining basal metabolism. That is to say, the individual should have had a good night's rest, no food for twelve hours and no exercise or excitement. Unless the patient is in the hospital or the test is run in the home a true basal metabolic rate is not obtained, for the exercise of dressing and going to the laboratory will have an appreciable influence on the oxidative rate. The half hour or hour rest is a poor compromise for basal conditions. This is not the most serious criticism of the determinations of basal metabolism, however. Many more errors are made when the patient is unable to relax because of nervous tension. Although the normal person would not be excited by such an examination, the person needing such a test is not normal and many of them are unable to relax after repeated tests. A single example will illustrate what has repeatedly been observed.

A freshman from the School of Commerce had been referred by the personnel office because of a failure in English and insubordination to one of the teachers. His physical examination and subnormal temperature left no doubt that his metabolism should be subnormal. During his first test it was obvious that he was not relaxed, although he did not move and the curve was fairly smooth. At the end of this test he was assured that the machine would not bite and was then told a funny story. A hearty laugh helped him to relax, and a second test was run within five minutes. The result of the original test figured +16 per cent and that of the second one —24 per cent.

This is the most extreme case yet encountered but illustrates what happens repeatedly in the basal metabolism determination.

Thus, nervous tension will also elevate the body temperature, as illustrated by the following case.

A football player suspected of having hypothyroidism took his temperature before getting out of bed and found it to be 96.1 F. While he was resting in the laboratory for his metabolism test, a thermometer was again placed in his mouth for ten minutes and it registered 96.4 F. A five minute metabolism test was run and the temperature again taken. It was 96.9 F. Thus without any exercise the excitement of the metabolism test was sufficient to raise the temperature 0.5 degree. The temperature at the end of the metabolism test was 0.8 degree higher than under basal conditions before arising.

It has been known for many years that the basal metabolic rate goes up as the body temperature rises. Hence it seems obvious that the result of this metabolism test was higher than it should have been, although it was found to be —18 per cent.

Because of these objections a search has been made for many years for a more accurate method of determining thyroid function. The blood cholesterol has been extensively used by some investigators but has been found useless in the present study. Since most of the present observations were carried out on college students, the failure of a correlation between metabolic rate and cholesterol content of the blood may be due to the age of the patient. Further work would be necessary to prove this point. The pulse rate has been sug-

gested by some authors, but in college students many rapid pulses have slowed down on thyroid therapy. No single symptom has been found which would apply to every person with low metabolism. Some have fatigue, some have cutaneous disorders, some have dry skin, some have nervousness, some have menstrual difficulties, some have dry hair and some have other symptoms, but none of these signs could be considered reliable in all cases.

In over 1,000 cases in which the basal metabolic rate has been found subnormal, the body temperature has never been found up to normal unless an infection was present. Often at the time of physical examination these highly excited patients may have oral temperatures of 99.0 to 99.2 F. These patients, however, will tell you that their temperatures are usually subnormal and subsequent visits to the office, when they are not excited, confirm their reports. Thyroid therapy in this large group of cases of subnormal metabolic rates has without exception led to an elevation in body temperature. These clinical observations merely confirm what has been known experimentally for many years. The cretin rabbit, produced by total thyroidectomy, has a subnormal body temperature. The temperature goes up as thyroid is administered, and if the dosage is excessive the temperature goes above normal. That a similar effect is produced in the human being is illustrated by the following case.

A physician's daughter was placed on a reducing diet for obesity and given 2 grains (0.13 Gm.) of thyroid daily for a subnormal basal metabolic rate and a low temperature. Two grains was adequate to maintain a normal temperature. She foolishly thought she would hasten the loss of weight and for two weeks took 7 grains (0.45 Gm.) of thyroid daily. (She gained 2 pounds [0.9 Kg.]) The typical symptoms of hyperthyroidism developed, and her temperature was 0.6 degree above normal. Her symptoms and elevated temperature promptly subsided when the dose was reduced to 2 grains.

It is well established clinically that the hyperthyroid patient has an elevated body temperature. Thus it appears from the experimental data and from clinical observations that body temperature might serve as an index of thyroid activity in hypothyroidism.

There is considerable disagreement in the literature as to whether all patients with low metabolic rates are hypothyroid. There is no doubt that starvation will lower the metabolic rate. This must be taken into consideration when malnutrition is so prevalent even in our own country. The extreme effect of starvation on metabolism is illustrated by Benedict's patient who fasted thirty-one days. The metabolism fell 30 per cent. It is interesting to note that the body temperature remained relatively constant during this entire period. Hence it seems that body temperature might well distinguish between cases of inanition and those of hypothyroidism. Other instances in which the metabolic rate goes down have not been followed, but at present it seems that the body temperature cannot be safely used.

The present group includes some patients with neurasthenia, chronic nervous exhaustion, arthritis and other diseases which are not generally considered to occur with hypothyroidism. The initial low temperature and the improvement seen when the temperature is elevated by thyroid therapy indicate that further work should be done in this field. No attempt will be made at present to decide whether or not the body temperature

hypothyroid. Very few patients with subnormal temperature fail to respond to thyroid therapy, both as to relief of symptoms and as to elevation in temperatures. Kleitman's observations<sup>2</sup> that efficiency parallels diurnal variations in body temperature indicate that further studies should be done in this field. Preliminary observations indicate that the person with subnormal body temperature is perceptibly improved in his performance, whether in industry in the class-room or on the athletic field by bringing his body temperature up to normal.

Another group of cases in which body temperature would be useful is illustrated by the following:

A woman aged 22 had been very nervous and underweight for several years. She suffered from palpitation of the heart, had a pulse rate of 110, blood pressure of 155 systolic and 100 diastolic, a fine tremor of the hands and hyperactive reflexes. Prior to entrance in the university her basal metabolic rate was +18 per cent, and she had been advised to have a thyroidectomy. She had refused the operation. Her body temperature was 97.6 F. The basal metabolic rate was found to be +8 per cent. The curve was smooth, but observations during the test left no doubt that she was not relaxed. She was given phenobarbital,  $\frac{1}{2}$  grain (0.03 Gm.) three times a day for one week and the metabolic rate was then found to be -8 per cent. She was started on thyroid therapy  $\frac{1}{2}$  grain daily and seen at weekly intervals. The dose was gradually increased to 2 grains (0.13 Gm.) daily. Over a period of six weeks the blood pressure gradually fell to 115 systolic and 85 diastolic, the pulse rate came down to 84 and the hyperactive reflexes became normal. The body temperature gradually rose. The nervousness and tremor of the hands improved.

The therapeutic results would leave no doubt in the mind of the physician or the patient that what had appeared to be a classic hyperthyroid syndrome was in reality hypothyroid in causation. The body temperature was the only criterion on which a correct diagnosis might have been made.

That such cases are not rare is indicated by 6 additional cases that I have observed during the past twelve months. In 5 of these an operation had been performed, and the subsequent history left no doubt of a mistaken diagnosis. In the other case, operation was delayed by a consultant surgeon who preferred to wait a year if possible because of the patient's age. The high metabolic rate observed in each case can be explained on the basis of nervous tension and inability to relax. The rapid pulse can be explained in some cases by a tendency for the circulation to collapse as a result of fatigue or exhaustion. The extreme of this is seen in surgical shock, in which circulatory collapse occurs resulting in the rapid, feeble pulse. In some cases the extreme nervousness resulting from chronic fatigue gives an elevated pulse rate and a pseudohypertension similar to that seen in the case illustrated. The low body temperature is incompatible with hyperthyroidism experimentally or clinically, and hence its use would have avoided the wrong diagnosis, the operation and the resultant aggravation of symptoms.

No serious objection to the use of body temperature as an indication for thyroid dosage has been raised in numerous conferences with competent physicians and physiologists. It seems unlikely that one could do damage to the heart or other organs with thyroid unless the body temperature goes above normal. However, no patients with organic heart disease have been treated in spite of subnormal body temperatures since the circulation load in hypothyroidism is definitely lighter

than in the normal person. This well known fact has led to total thyroidectomy for congestive heart failure. Hence it seems unwise to increase the load of a damaged organ. No evidence has been encountered, however, to indicate that the normal heart is damaged by raising the body temperature to normal. On the other hand, the benefits derived by normal circulation seem to outweigh any theoretic damage to the normal heart.

The procedure followed at present for the diagnosis of subnormal body temperature is as follows. The patient places a thermometer and book by his bedside. When he awakens in the morning the thermometer is left in the mouth without interruption for ten minutes by the clock (the use of the book is obvious). It will be found that in the absence of a cold or other infection the daily variation in one's temperature is comparatively slight. The menstrual cycle causes about 1 degree variation with the low point at the time of ovulation and a gradual rise to a peak occurring a day or two before menstruation.<sup>3</sup> It will be necessary to determine the basal temperature in a large number of cases before setting a standard. Hence the tentative standard set here may be modified slightly by more data, but it will serve as a safe working range for the present. It is based on observations on patients without symptoms as well as on patients with symptoms which were relieved by adequate doses of thyroid over long periods. For the male the basal temperature seems to be near 98.0 F. For the female the average for the entire period has been found to be about 98.0 F. with the low point at the time of ovulation at 97.5 and the peak near 98.5.

When the subnormal temperature is elevated with thyroid therapy, few unpleasant symptoms are experienced if the dosage is increased gradually. It has been found that most patients will tolerate 1 gram (0.065 Gm.) of U. S. P. thyroid<sup>4</sup> as an initial dose. The entire dose is taken at breakfast time solely to form the habit and avoid divided doses later in the day. The initial dose is continued for four weeks and the basal temperature rechecked for two or three mornings. If the temperature is still subnormal, the dosage is raised 1 gram and continued for another four weeks. The basal temperature is again checked and a third gram added if necessary. This is the maximum dose used in this series of 1000 patients and the majority have had normal temperatures within six months. Patients will be encountered requiring more, but if the dose is raised gradually, as here outlined, and the temperature followed closely at monthly intervals, probably no great harm will be done. The patient usually asks how long he must continue therapy. It is significant that the first patient given thyroid began in 1891 and stopped in 1919, when she died at the age of 74. (It is also historically noteworthy that Dr. Murray<sup>5</sup> observed in this case a subnormal temperature of 95.6 to 97.2 F. and that on thyroid therapy the temperature rose to 98.2.) The medication can be stopped when the patient's requirement is reduced to meet the capacity of his own thyroid gland. There is a gradual reduction in requirement with advancing years. A safe procedure would seem to be to continue the dosage required to maintain a normal temperature for one year. An attempt might then be made to decrease the dose by 1 gram for six days. By this time the gland should pick up the defi-

ciency if it is capable of meeting the emergency. If the temperature is found subnormal at that time and symptoms have recurred, it would seem worth while continuing the former dose for another year. Yearly reduction of 1 grain under these circumstances should avoid any unpleasant reactions. It is well to advise the patient on his first visit at the time he is concerned about his symptoms that his medication may have to be continued for many years. Otherwise he is likely to improve, become careless about taking his thyroid and develop new symptoms different from those previously experienced, and as a result he may change physicians. It is well to have the patient report his basal temperature, at least by telephone, once each month, by so doing he is far more likely to continue his therapy. The physician likewise is reassured that the dosage is not excessive. The routine taking of temperatures in an active practice reveals many that are subnormal. The etiology of this large group is now under investigation, and apparently a simple explanation can account for them.

## SUMMARY

1 From a study of over 1,000 cases the results indicate that subnormal body temperature is a better index for thyroid therapy than the basal metabolic rate.

2 The differential diagnosis between hypothyroidism and hyperthyroidism is sometimes difficult. In 7 cases reported the diagnosis was wrong, in 5 of which an operation had been performed. The temperature was subnormal in each case.

# REPORT ON ACUTE ILLNESS AMONG RURAL MATTRESS MAKERS USING LOW GRADE, STAINED COTTON

PAUL A. NEAL, M.D.

ROY SCHNEITER, M.S.

AND

BARBARA H. CAMINITA, B.S.

BETHESDA, MD

This report deals with an acute illness among workers in rural mattress making projects using low grade cotton. The history of the outbreaks of illness, distribution of cases, estimated number of persons involved, nature of the illness and description of the investigations undertaken to determine the cause of the illness are presented.

Numerous reports of sudden outbreaks of acute illness occurring among workers on rural mattress making projects were received by the U. S. Public Health Service throughout the period from March to December 1941. Outbreaks of a similar illness were also reported in one cotton mill and in several cottonseed processing plants. Illness invariably followed the use of a very low grade, dusty, stained cotton of the 1940 crop.

The rural mattress making projects, sponsored by the U. S. Department of Agriculture, were part of a program designed to reduce the cotton surplus and to

benefit farm families. Rural families in the low income groups who wished to make mattresses for home use were supplied with 50 pounds of cotton and 10 yards of cotton ticking for each mattress. Participating families in a community made their mattresses cooperatively at the same work center. Contact with the cotton was limited to the time allowed each family to make its quota of mattresses.

The mattress making procedure involved opening bales, fluffing or carding the cotton, filling and closing the mattresses and beating the mattresses to secure uniformity of surface. All of these operations were extremely dusty when the low grade, stained cotton was used. Illness occurred among workers exposed to high dust concentrations, and the severity of the illness varied with the degree of exposure.

Illness began from one to six hours after work was begun. Initial symptoms were fatigue and generalized aches, followed by anorexia, headache, nausea and vomiting, the latter lasting six to nine hours in some cases. About six hours after exposure a sense of chilliness supervened, followed usually by frank chills, fever and headache. In several patients an oral temperature in excess of 102° F. was noted. Anorexia and nausea extended beyond the acute phase. Fatigue and generalized aches lasted from forty-eight hours to four or five days. Many complained of abdominal pains, cramps and of substernal discomfort or pressure, varying in intensity and duration, so that the person was unable to take a deep breath. Neither age nor sex seemed to influence the incidence of the disease.

These mattress making projects have been in operation since February 1940, but no outbreak of illness was reported prior to March 1941. According to information supplied by Mrs. Ola Powell Malcolm of the extension service of the U. S. Department of Agriculture, there were 2,832,885 families engaged on rural mattress making projects in forty-six states during 1941. During the years 1940 and 1941 a total of 3,944,400 mattresses and 1,119,376 comforters, using 500,000,000 pounds of cotton, were made in rural mattress making centers. Twenty-five states reported scattered outbreaks of illness in the course of these projects. The actual number of cases of this illness occurring during the year 1941 cannot be determined. However, it is known that there were many more than 700 cases in one state alone.

On receipt of the first reports of illness all state health departments were requested to submit (a) reports of cases of illness among workers in low grade cotton projects, (b) samples of cotton incriminated in the outbreak, and (c) whenever possible (c) nose and throat swabs and other specimens for examination. The majority of the mattress making projects were located in relatively inaccessible rural districts, so that it was impossible to obtain the desired information and samples immediately after the occurrence of an outbreak. It was recommended to officials of the U. S. Department of Agriculture that gauze masks be worn by persons exposed to the cotton dust until the low grade, stained cotton could be replaced. Outbreaks of illness did not occur among workers when these recommendations were followed.

## INVESTIGATION INTO CAUSE OF OUTBREAK

The following samples of cotton and cotton ticking were received from thirteen states:

Fifty-eight samples of low grade cotton and cotton ticking from projects in the course of which illnesses had been reported.

From the Division of Industrial Hygiene, National Institute of Health.

A. R. Monico and S. W. Jones acted as controls in the human exposure experiments. J. W. Long and R. W. Kolb cooperated in the bacteriologic and serologic studies. J. W. Crosson of the West Virginia State Department of Health and officials of other state health departments and the U. S. Department of Agriculture assisted in obtaining epidemiologic data. R. W. Webb and H. C. Slade of the Agricultural Marketing Administration, U. S. Department of Agriculture, classified the cotton samples implicated in outbreaks of illness and supplied various grades of cotton for comparative purposes.

Three control samples, two of which were high grade, normal cotton and the third a much lower grade specifically reported not to have caused illness.

Six samples of dust two of which were collected in a cotton mill in which cases of acute illness had occurred following the use of stained cotton.

Intensive laboratory investigation of these samples included physical chemical mycologic, bacteriologic, serologic and biologic examinations.

#### PHYSICAL EXAMINATION OF COTTON SAMPLES

All the samples of low grade cotton ranged from a light yellow to a dirty brown and contained varying amounts of plant debris. Handling the samples produced a cloud of dust.

The majority of these samples were classified within official grades for tinged and stained cotton by graders of the U S Department of Agriculture. Many of these samples were described as bolly.<sup>1</sup> The samples of low grade cotton reported to have caused illness will be referred to hereafter as "stained" cotton.

Two of the control samples of normal cotton were white and free of foreign matter, the third contained numerous particles of plant debris. None of these control samples were noticeably dusty when fluffed. These samples will be referred to as "normal" cotton.

The crystallographic microscope was used to make a search for particulate matter under mountants of different indexes of refraction, i e water glycerin and piperine. The particulate material was small in amount and apparently of organic rather than of inorganic nature.

#### CHEMICAL EXAMINATION OF COTTON SAMPLES<sup>2</sup>

Several possible sources of chemical toxicity were considered, namely insecticide contamination, and various fractions of the cotton as protein, lipid (particularly gossypol) and histamine.

**Insecticide Contamination**—A sufficient number of samples of stained cotton were examined to warrant the statement that the illness caused by this cotton was not due to insecticides or to toxic gases.

**Presence of Toxic Fractions in Cotton**—The toxicity of aqueous, isotonic sodium chloride and ether extracts from several 10 Gm samples of stained cotton and normal cotton was determined by intraperitoneal injection of 2 cc of each extract into experimental animals. No abnormalities were noted following these injections. After two weeks had elapsed the experiments were repeated to see whether sensitization had occurred. The results were negative.

Nitrogen determinations were made on aqueous, isotonic sodium chloride and organic solvent extracts of stained cotton that had caused illness and of normal cotton that had not caused illness. The nitrogen content of the extracts of stained cotton was about ten times that of the normal cotton.

Examination of a 100 Gm sample of the stained cotton for histamine, with the method described by Prausnitz,<sup>3</sup> was negative as far as could be judged by the ordinary laboratory procedures and in direct comparison with known quantities of histamine. It should be pointed out, however, that in the experimental work

described by Prausnitz large amounts of cotton dust were used, whereas in the experiments previously indicated the raw cotton was used because large amounts of cotton dust were not available.

Ultraviolet absorption spectrums of ether extracts of equal quantities of stained cotton, sterilized stained cotton and normal cotton were obtained by P A Cole of this laboratory. Selective absorption in the range of 2 600-2,900 angstroms was demonstrated in the case of extracts of stained cotton and sterilized stained cotton, but not in the case of extracts of the normal cotton. The selective absorption of the sterilized, stained cotton was about one half that of the unsterilized stained cotton.

#### MYCOLOGIC EXAMINATION OF COTTON SAMPLES

Because of the discoloration of the cotton, its moldy odor and the temperature and humidity incident to storage conditions, it was suspected that molds pathogenic for human beings might be present.

All samples of stained cotton submitted were examined for molds, and representative cultures were submitted to senior mycologist C W Emmons, Division of Infectious Diseases National Institute of Health, for tentative identification. He reported various strains of *Alternaria*, *Mucor*, *Rhizopus*, *Fusarium*, *Sporotrichum*

Fig 1—Micro-organisms within stained cotton fiber Gram's stain

and *Aspergillus niger*. *Coccidioides* was not found. Charles A Thom, principal mycologist, Bureau of Plant Industry, U S Department of Agriculture, reported the presence of strains of *Alternaria* and *Cladosporium*, *Aspergillus* and *Penicillium* in samples of stained cotton implicated in the outbreaks of sickness. He did not find *Aspergillus fumigatus*. Dr Thom and Dr Emmons expressed the opinion that the low incidence of fungi and the infrequent occurrence of pathogenic types of fungi would preclude this class of micro-organisms as the causative agents of this unnamed illness.

#### BACTERIOLOGIC AND SEROLOGIC STUDIES

A microscopic examination of fibers of the stained cotton in moist preparations demonstrated the presence of micro-organisms in mucilaginous clumps along the sides of the individual cotton fibers.

Fibers of stained and of normal cotton were stained by Gram's method and mounted in balsam. Microscopic examination demonstrated that the fibers of stained cotton were thin walled and contained many short, rod-shaped bacteria within the lumen, whereas the fibers of normal cotton were thick walled and free of bacteria.

The stained preparations of cotton fibers were also examined by E E Berkley, cotton technologist, Bureau of Plant Industry and Agricultural Marketing Administration, U S Department of Agriculture. He concurred in the opinion that the stained bodies or cells, considered to be micro-organisms, were definitely within

2 The chemical investigations were performed by L T Fairhall S W Jones and E D Palmes of this laboratory.

3 Prausnitz Carl Investigations on Respiratory Dust Disease in Operatives in the Cotton Industry report issued by the Medical Research Council Special Report Series 212 London 1936

the lumen of the fiber and were not a part of the fiber wall structure

A quantitative bacteriologic examination was made of all samples of cotton and cotton materials received for investigation. Potato-carrot-dextrose agar<sup>4</sup> was employed as the plating medium. The plates from all samples of stained cotton showed a heavy growth of

Fig 2—Incidence of mucoid bacterium in dilutions of 1 1,000,000 (at left), 1 10,000,000 (in center) and 1 100,000,000 (at right) from two samples of stained cotton (sample 1, top row, sample 2, bottom row)

large, mucoid, spreading colonies, colorless to pale yellow. This medium was fermented with a yeasty odor, and gas was produced by subsurface colonies. Microscopic examination of isolated colonies showed a gram-negative rod averaging 2 microns by 0.7 micron, heavily encapsulated and having 1 to 4 polar flagella. The organisms were actively motile in hanging drop preparations.

This organism was found in stained cotton in numbers varying from three million to well over a billion per gram of sample. The plate counts on the 58 samples of stained cotton averaged 840,000,000 per gram of sample. This organism occurred to the exclusion of any significant numbers of other types of organisms. Figure 2 shows the incidence of this micro-organism on potato-carrot agar plates from high dilutions of 2 samples of stained cotton.

The mucoid organism was not recovered from the control samples. The plate counts of miscellaneous micro-organisms on the 2 high grade control samples were 13,000 and 110,000 per gram respectively. The low grade control sample showed a plate count of 79,000,000 miscellaneous organisms per gram. According to the U. S. Department of Agriculture,<sup>5</sup> three million organisms per gram of cotton is the maximum plate count to be expected from normal cotton. Prindle<sup>6</sup> has reported that numbers of bacteria in raw cotton range from one million to one hundred million per gram.

Figure 3 shows the incidence of miscellaneous bacteria on potato-carrot agar plates from low dilutions of 2 samples of normal cotton.

Two samples of dust from a cotton mill in which several cases of illness had occurred revealed the incidence of the mucoid organisms to be 1 billion 200 million and 16 billion organisms per gram. The 4 samples of dust from North Carolina cotton mills in

which this unnamed illness had not been reported but in which cases of mill fever had occurred did not show an incidence of the mucoid organism in excess of 1 million per gram.

The examination of a sample of cotton collected in 1938 from a cotton mill in which an outbreak of "mill fever"<sup>7</sup> had occurred revealed that this cotton three years after collection, contained this micro-organism in excess of 3 million per gram of cotton.

In order to determine the distribution of the mucoid organisms in different types of cotton, 17 samples representing practically all grades of white, tinged and yellow stained cotton, were obtained from the U. S. Department of Agriculture. The presence of the mucoid bacterium was demonstrated in all grades of yellow stained cotton and in only 1 sample of low grade, tinged cotton. The incidence of this micro-organism ranged from 5 thousand to 670 million per gram. It has not been demonstrated in any of the grades of white cotton or in the better grades of tinged cotton examined. The results of these examinations indicate a possible wide distribution of the mucoid bacterium in low grade, tinged and yellow stained types of cotton.

The biochemical reactions were determined on representative cultures from each sample of cotton and cotton dust examined. Cultures of the mucoid micro-organism which gave identical biochemical reactions were isolated from 54 of the 58 stained cotton samples and from all the 6 samples of dust. On the basis of its morphologic characteristics and its ability to ferment sugars, this micro-organism may be tentatively placed in the genus *Aerobacter*. This micro-organism will be referred to in this paper as the "cotton bacterium".

The cotton bacterium was never isolated from blood cultures obtained from persons who had contracted the illness nor from nose and throat swab cultures except in a limited number of cases in which the swabs were taken during or immediately after the illness.

It was thought that the cotton bacterium might be pathogenic for cotton plants. However, infection of cotton seedlings<sup>8</sup> could not be induced. The organism could not be recovered from the leaves of seedlings

Fig 3—Incidence of miscellaneous organisms in dilutions of 1 1,000 (at left), 1 10,000 (in center) and 1 100,000 (at right) from two samples of normal cotton (sample 1, top row, sample 2, bottom row)

a month after inoculation. It was recovered from soil three months after inoculation.

A series of experiments was carried out in order to ascertain the pathogenicity of the cotton bacterium.

<sup>4</sup> Formula: Potatoes 2,000 Gm, carrots 500 Gm, dextrose 200 Gm, magnesium sulfate 3 Gm, calcium carbonate 2 Gm, agar agar 150 Gm and water 10 liters, pH adjusted to 6.8.

and the toxicity of filtrates obtained from broth cultures of this organism and from saline extracts of stained cotton

Berkefeld filtrates of seven day tryptose broth cultures of the cotton bacterium and of a saline extract of stained cotton were injected intravenously into rabbits. One to 2 cc of these filtrates was the minimum quantity required to kill 15 to 2 Kg rabbits. The intravenous injection of much larger quantities of filtrates from saline extracts of normal cotton and of sterile tryptose broth caused no toxic manifestations in rabbits.

Intranasal application of the cotton bacterium in several species of animals did not produce any ill effects. The subcutaneous injection of the cotton bacterium in rabbits caused abscess formation from which the cotton bacterium was isolated. Massive doses of cotton bacterium cultures and culture filtrates were required to kill mice and guinea pigs when injected intraperitoneally.

The Dolman<sup>9</sup> and Hammon<sup>10</sup> tests for enterotoxin were employed for testing Berkefeld filtrates of saline extracts of stained cotton and of seven day tryptose broth cultures of the cotton bacterium.

These tests demonstrated that filtrates of these substances contained heat stable toxic material capable of inducing vomiting and diarrhea in cats. Similar filtrates of saline extracts of normal cotton gave negative results.

An extensive series of Schwartzman<sup>11</sup> tests was employed to determine whether or not a local cutaneous reactivity would be produced by the toxic substances liberated by the cotton bacterium.

The materials tested included heated and unheated Berkefeld filtrates from tryptose broth cultures of the cotton bacterium, heated and unheated filtrates from saline extracts of stained cotton and filtrates from saline extracts of normal cotton. Sterile tryptose broth and sterile isotonic solution of sodium chloride were employed as control solutions. A typical positive Schwartzman reaction is shown in figure 4.

These experiments revealed the following: (a) A heat stable endotoxin-like substance is liberated by the mucoid cotton bacterium, (b) a similar toxic substance is present in filtrates from saline extracts of stained cotton incriminated in outbreaks of illness, (c) this endotoxic substance is not present in filtrates from saline extracts of normal cotton. It was also demonstrated by the Schwartzman reaction that homologous immune serums prepared through rabbit immunization with cultures of the mucoid cotton bacterium and with filtrates from saline extracts of stained cotton contained antibodies capable of neutralizing the endotoxin-like substance present in these materials.

Agglutination and precipitation tests were employed to determine whether antibodies were present in human or animal serums in response to the introduction into the body of the viable or killed cultures of the cotton bacterium, filtrates of broth cultures (endotoxin) of the bacterium and filtrates from saline extracts of stained cotton.

The serums tested were as follows: (a) human serums obtained from persons in several states who had had acute illness twenty-four hours to several weeks prior to the time the serums were obtained, (b) serums obtained from 4 baboons at known intervals after a

seven hour exposure to stained cotton, (c) serums obtained from rabbits given repeated intravenous injections of saline suspensions of viable and killed organisms, Berkefeld filtrates from twenty-four and forty-eight hour and seven day tryptose broth cultures of these micro-organisms and filtrates of saline extracts of stained cotton, (d) control serums obtained from persons not known to have had the illness, from 1 baboon not exposed to stained cotton, from a rabbit injected with a filtrate of a saline extract of normal cotton and from a normal noninjected rabbit.

The antigen used for agglutination tests consisted of a filtered uniform saline suspension of eighteen to twenty-four hour potato-carrot agar slant cultures of the bacterium isolated from cotton samples which had been implicated in outbreaks of the acute illness.

All human serums, including the controls, and all baboon serums contained low titer agglutinins for the cotton bacterium. The explanation for this fact is unknown. However, it would seem to indicate that because the cotton bacterium is closely related to certain types of bacteria commonly found in the intestinal tract of primates it may be agglutinated by their antibodies. It would also indicate that an increased production of antibodies in the blood is not stimulated by exposure to the cotton bacterium under the conditions described.

Fig 4—Necrotic areas denote positive Schwartzman reactions produced by Berkefeld filtrates from forty-eight hour and seven day tryptose broth cultures of the cotton bacterium.

herein. No significant decrease in the titer of human or of baboon serums was observed.

Identical antibodies were produced in rabbit blood by all saline suspensions of viable and killed organisms, by Berkefeld filtrates from twenty-four and forty-eight hour and seven day tryptose broth cultures and by filtrates from saline extracts of stained cotton. No agglutinins for the cotton bacterium were produced by those rabbits injected with filtrates of saline extracts of normal cotton, nor were such agglutinins present in the blood serum of normal, nonimmunized rabbits. There was a tendency for the titer of the serum to decrease gradually with increasing length of time after the last injection of the antigen. These rabbit immune serums were utilized to separate the cultures isolated from the cotton samples into a number of serologic groups. The majority of the cultures fell within the same serologic group.

Although the cotton bacterium is of the same general morphologic type as *Proteus vulgaris* (strain X 19), a serologic relationship could not be demonstrated between the two organisms.

Two precipitinogens were used in the precipitation tests. One was prepared from an eighteen hour tryptose broth culture of the cotton bacterium by Lancefield's<sup>12</sup>

<sup>9</sup> Dolman C E, Wilson R J and Cockcroft W H. A New Method of Detecting *Staphylococcus Enterotoxin*. *Canad Pub Health J* 27: 489-493 (Oct.) 1916.

method, the other was prepared from an isotonic sodium chloride extract of stained cotton by filtration through a Berkefeld N candle and concentration by vacuum distillation at 30 to 32 C.

Most of the human serums, including the controls, gave positive precipitation tests in low dilutions with both precipitinogens. Rabbit serums from normal non-immunized animals and from the animal injected with filtrates from a saline extract of normal cotton did not show any significant precipitin titer. All other rabbit serums gave positive precipitation tests with both precipitinogens. These precipitation tests indicated that the stained cotton contained an extractable substance which is precipitated by serums from rabbits immunized with the cotton bacterium.

#### ANIMAL EXPERIMENTS

Hamsters, guinea pigs, rabbits, kittens, monkeys and baboons were exposed to various cotton dusts. Cotton

Fig 5—Cotton dust exposure chamber showing carding device

dusts tested were (a) stained cotton sterilized at 185 C for twelve hours, (b) unsterilized stained cotton, (c) unsterilized normal cotton, (d) normal cotton contaminated with a seven day tryptose broth culture and with a twenty-four hour tryptose broth culture of the cotton bacterium. The presence or absence of the cotton bacterium was determined in all cotton samples before use for animal exposure.

**Exposure Apparatus**—All animals were exposed in 2 foot square compartments constructed with windows on two sides to facilitate observation of the test animals. Each compartment was fitted with a cylindric 0.25 inch mesh wire cage 16 inches high with an electrically motor driven propeller suspended in the center. Each cage was filled with the cotton material being tested about five times during the exposure period. This crude carding device saturated the atmosphere with cotton dust. The exposure compartments are illustrated in figure 5.

All animals were carefully examined and observed prior to, during and after the exposure period. Records were kept as to the weight, temperature, pulse rate, respiratory rate and other physical signs. All animals were usually exposed for a continuous period of several hours.

Eight guinea pigs and 3 rabbits were exposed to dust from stained cotton for seven hour periods over a period of five days. Fifteen additional rabbits were exposed to stained cotton dust for two and one half days. Irritation of the mucous membranes in guinea pigs was evidenced by nose pawing immediately after they were placed in the exposure chamber. In none of the animals did any symptoms of illness develop and all were in good condition a month after the experiment.

**Monkeys**<sup>13</sup>—Four monkeys were given a seven hour inhalation exposure, i. e. 1 monkey to each type of cotton. In none of these animals did any definite symptoms of illness develop. The same 4 monkeys were reexposed to the same materials on two other occasions at intervals of twelve days. In none of the animals did symptoms develop on reexposure.

**Baboons**—Four baboons were given a seven hour inhalation exposure, i. e. 1 baboon to each type of cotton. One nonexposed baboon was retained as a control. Three of the exposed baboons did not show any abnormal symptoms. The baboon that was exposed to untreated stained cotton exhibited some degree of discomfort as if experiencing difficulty in breathing. Its breath sounds were somewhat harsh. Increasing symptoms of illness developed and the animal died five days after exposure. The gross autopsy findings were essentially negative. However, the microscopic examination indicated that the animal died from bronchopneumonia. Cultures obtained from the nose, trachea, heart and intestine at autopsy were negative for the cotton bacterium.

In a second series of similar baboon exposure experiments 2 baboons used in the first test and 1 new animal were exposed to unsterilized stained cotton dust. The fourth baboon was reexposed to normal cotton dust which had been contaminated with a seven day tryptose broth culture of the cotton bacterium. The fifth animal was again retained as a control. Two of the baboons that were exposed to the unsterilized stained cotton exhibited definite symptoms of illness during the last two hours of the exposure period. These symptoms were irregular respiration, difficulty in breathing, listlessness and indifference to food. However, all symptoms subsided within a few hours after the termination of exposure. The other animal employed in this test failed to show any symptoms of illness.

**Kittens and Hamsters**—Four kittens and 8 hamsters were exposed for seven hours to each of the four types of cotton respectively. One nonexposed kitten was retained as a control. None of these animals exhibited any abnormalities either during or after exposure to any of the types of cotton tested. The gross autopsy findings and cultures taken at autopsy from the animals by chloroform were essentially negative.

**Summary**—Five baboons, 4 kittens, 30 hamsters, 8 guinea pigs, 4 monkeys and 18 rabbits were exposed to various types of cotton dusts for one or more hour periods. In 3 of the baboons exposed to unsterilized stained cotton mild symptoms of illness

<sup>13</sup> F. W. von Oettingen, D. D. Donahue and J. W. D. this laboratory carried out the exposure studies with monkeys.

developed. None of the other animals exhibited any symptoms. It must be concluded from the results of all animal exposure tests, that none of the common experimental animals are very susceptible to this unnamed illness.

#### HUMAN EXPERIMENTS

The foregoing bacteriologic and serologic studies indicated that a short, gram-negative rod shaped bacterium, or its products, isolated from stained cotton was the agent probably responsible for the illness under study. Since it could not be definitely produced in any of the species of laboratory animals tested, human exposure experiments were undertaken.

**Cotton Material Tested**—This consisted of (a) normal cotton free from the cotton bacterium, (b) normal cotton contaminated with a saline suspension of a twenty-four hour potato-carrot agar slant culture of the cotton bacterium (1 million per gram of cotton)

examination which included roentgenograms of the chest, a complete blood picture and urinalysis. Nose and throat cultures were taken before and after each exposure. Records were kept of the temperature, pulse rate, respiratory rate, changes in blood picture and development of symptoms in each person during each exposure experiment, and each person was examined by a physician following each exposure and at intervals throughout each experiment.<sup>14</sup>

**Exposure to Normal Cotton**—The 3 test subjects did not show any signs or symptoms after exposure to normal cotton. The 2 control subjects, who were repeatedly exposed to normal cotton dust under the same conditions, showed no signs or symptoms incident to such exposure.

**Exposure to Sterilized Stained Cotton**—There were no abnormal signs or symptoms during the exposure except slight irritation of the mucous membranes of the eyes and nose. Swab cultures taken from the nose and

\* No symptoms of illness developed in the test subjects after exposure to normal cotton dust or in the control subjects after repeated exposures to normal cotton dust.

and a Berkefeld filtrate from a seven day tryptose broth culture of the same organism, (c) stained cotton sterilized at 175 to 180 C for two hours on two successive days, (d) unsterilized stained cotton containing 800 million of the cotton bacterium per gram of cotton, (e) filtrate from a seven day tryptose broth culture of the cotton bacterium and (f) sterile tryptose broth. The presence or absence of the mucoid cotton bacterium was determined in all cotton samples before use for human exposure.

**Exposure Apparatus**—Human inhalation experiments were carried out in the compartments described under animal exposure experiments (fig 5).

Three test subjects (A, B and C) were exposed for ten minutes to each type of cotton dust during these studies. Two control subjects (D and E) were exposed to normal cotton dust for ten minutes on every occasion when the test subjects were exposed to other types of cotton. A week or more was allowed between the exposures to each type of cotton material. Prior to each exposure the subjects were given a complete physical

throat of all 3 persons were negative for the cotton bacterium immediately after this exposure. Eight hours after the exposure A complained of slight headache, slight generalized aches, some cough and some tightness of the chest. B had no symptoms other than a slight dryness of the throat. C complained of slight headache, generalized aches, weakness, dizziness and cough (table 1). All symptoms had disappeared twenty-four hours after exposure. It is thought that these mild symptoms were due to minute quantities of the heat stable endotoxin which were not destroyed by sterilization. The oral temperatures, the pulse rates, the total leukocyte counts and differential counts were normal throughout this period.

**Exposure to Contaminated Normal Cotton**—A, B and C were exposed to normal cotton contaminated with pure cultures of the cotton bacterium and its toxic filtrates. During the exposure there were no symptoms other than irritation of the mucous membranes of the

<sup>14</sup> R. F. Sievers and E. C. Thompson of this division performed the physical examinations and the hematologic determinations respectively.

eyes and throat Swab cultures taken from the nose and throat before exposure were negative, but similar cultures taken immediately after exposure revealed the presence of the cotton bacterium (fig 6) Symptoms of illness in the 3 persons began two to three hours after exposure These symptoms were approximately the same in all 3, varying somewhat in intensity (table 1)

Fig. 6—Nose and throat swab cultures before and after exposure to stained cotton dust

There was a slight elevation of temperature and an increase in pulse rate beginning within four to seven hours after exposure and lasting about eight hours in all 3 cases A significant leukocytosis, characterized by an increase in segmented cells and bands, developed within five and one-half hours after exposure (table 2) Within thirty hours after exposure the total leukocyte count had returned to normal Other than these conditions, the physical examinations of all 3 subjects were essentially negative The test subjects were asymptomatic and normal within twenty-four to forty-eight hours after the exposure Roentgenograms of the chest after exposure were negative in all 3 cases

*Exposure to Stained Cotton*—During this exposure the 3 subjects experienced decided irritation of the mucous membranes of the eyes, nose and throat Swab cultures taken from the nose and throat of each subject immediately preceding the exposure did not show the presence of the cotton bacterium, but similar cultures taken immediately after the exposure were heavily contaminated with the organism (fig 6) This contamination persisted for twenty-four hours in the case of B, while cultures from the other 2 subjects were negative at this time

The same symptoms of illness as those noted after exposure to contaminated normal cotton began in all 3 subjects within one and one-half hours after exposure However, the symptoms were much more severe, as will be noted in table 1, and each subject complained of nausea Within three to four hours after exposure in all 3 cases there was an increase in pulse rate and pronounced leukocytosis (table 2) Within five hours after exposure A's temperature had increased from

36.7 C to 39.3 C (98.1 to 102.7 F), B's from 37.2 C to 38.4 C (98.9 to 101.1 F) and C's from 37.1 C to 38.5 C (98.7 to 101.3 F) Twelve hours after exposure the temperatures and pulse rates had returned to normal All 3 cases showed an increase in bands and segmented cells The leukocyte counts gradually returned to normal within thirty to fifty hours

*Exposure to Berkefeld Filtrate of Seven Day Tryptose Broth Culture of the Cotton Bacterium*—B was exposed for one minute to a fine mist of a sterile Berkefeld filtrate from a seven day tryptose broth culture of the cotton bacterium several weeks after exposure to the stained cotton dust Symptoms of illness began within forty-five minutes Signs and symptoms were identical in type, severity and duration with those noted after exposure to the dust from stained cotton As a control test, A, B, C and E were exposed for one minute to a fine mist of sterile tryptose broth of the same type as that employed for toxin production by the cotton bacterium This exposure did not produce any signs or symptoms of illness

Physical findings other than those already described remained normal in all the human subjects There were no changes in the erythrocyte counts hemoglobin values, urinary findings and roentgenograms of the chest, nor was there evidence of any sequelae

Five cases of illness have occurred in this laboratory following accidental exposure to the cotton dust or to spray mists from broth cultures of the cotton bacterium The symptoms were the same as those already described The cotton bacterium was isolated from the respiratory tracts in 2 of the cases

*Patch Tests*—All the materials noted were used in patch tests on A, B and D before and on A, B, C, D and E after the inhalation experiments No significant positive reactions resulted

*Intradermal Injections*—One tenth cc of the following materials was injected intradermally into the forearms of subjects A, B, C, D and E (1) filtrate from seven day tryptose broth culture of the cotton bacterium, (2) filtrate from saline extract of stained cotton, (3) filtrate from saline extract of normal cotton, (4) sterile tryptose broth and (5) sterile isotonic solution of sodium chloride All tests were observed at least twice a day for a period of four days

TABLE 2—Changes in Leukocyte Counts During Experimental Illness

| Test Material              | Test Subject | Leukocyte Count |   |
|----------------------------|--------------|-----------------|---|
|                            |              | Before Exposure | Leukocyte Count (thousand per cubic mm) |
| Contaminated normal cotton | A            | 6,100           | 11,400                                  |
|                            | B            | 10,000          | 14,000                                  |
|                            | C            | 9,200           | 13,000                                  |
| Stained cotton             | A            | 7,000           | 9,000                                   |
|                            | B            | 7,800           | 11,000                                  |
|                            | C            | 9,400           | 10,000                                  |
| Culture filtrate           | B            | 8,800           | 10,000                                  |

Berkefeld filtrates from broth cultures of the cotton bacterium and from the saline extract of stained cotton caused severe cutaneous reactions and systemic symptoms within three hours in the subjects who had been exposed to normal cotton dust as well as in the subjects who had experienced attacks of illness The reactions were characterized by severe erythematous lesions which were extremely painful on pressure and

15 Formula Bacto tryptose 20 Gm., Bacto-dextrose 2 Gm., sodium chloride 5 mg., disodium phosphate 2.5 Gm., distilled water 100 cc. Autoclave twenty minutes at 15 pounds pressure

in size from 5 by 5 cm to 15 by 7 cm. All subjects except D complained of headache and generalized muscular pains within about ten hours. B, C and E had a severe lymphangitis and lymphadenitis of the arm lasting about thirty hours. All evidence of the injections disappeared within four days. It is to be noted that subject E, who had not had the illness, showed as severe a reaction as did subjects A, B and C. The nature of the cutaneous reactions denoted a definite intoxication rather than a sensitization to the substances injected. None of the 5 subjects had any significant reaction at the site of the intradermal injections of sterile tryptose broth, sterile isotonic solution of sodium chloride or the filtrate from the saline extract of the normal cotton.

It is evident that the illness following these exposures was caused by the cotton bacterium or its products. The symptoms of this illness were similar to those reported in outbreaks of illness occurring in rural mattress making centers, one cotton mill and three cottonseed plants in which stained cotton was processed.

#### COMMENT

The subjective symptoms encountered in acute illness among rural mattress makers except for much greater severity are almost identical with those of the so-called mill fever and Monday fever found in cotton mill workers.<sup>16</sup> These diseases follow the inhalation of dusty cotton. According to the literature, cotton mill workers, while engaged in the initial stages of cotton processing, are subject to frequent illness due to a special and complex cause which has not been completely elucidated but which has been considered to be both allergic and mechanical.

The Departmental Committee on Dust in Cardrooms in the Cotton Industry in 1932<sup>17</sup> reported that the symptoms of the illness among cotton cardroom operatives were due to the action of the dust on the mucous membranes of the respiratory passages. According to this report, there was no evidence of aspergillosis or other similar disease of the lung due to inhalation of fungus mycelia, conidia or spores. The committee reported the presence of large numbers of gram-negative bacilli in the cotton dust. However, no importance was attributed to these bacteria, since no factor common to the bacteriology of the dust and the patients' sputum was found. In an appendix to this report<sup>17</sup> Matland and his associates reported the presence of histamine in cotton dust and suggested the possibility of histamine being a causative factor in cotton mill illness.

The desirability of following up this clue led the Medical Research Council of Great Britain to institute a study of illness in cotton mills. The results of this investigation are given in the report by Prausnitz.<sup>3</sup> He concluded that histamine, although present in cotton dust, was not the cause of the illness. On the basis of particle size determinations and animal experiments with cotton dust however, Prausnitz formulated the following conception of the pathogenesis of the cotton mill illness: "1. Irritating soluble proteins of the cotton dust penetrate into the alveolar tissue and gradually produce thickening of the alveolar walls. 2. Simultaneously, or perhaps even before that supersensitive-

ness is acquired. 3. Superficial irritation of the bronchial mucous membrane by the dust leads to chronic bronchitis, cough and ultimately to emphysema."

In connection with this illness among cotton card room operatives, the British Parliament in 1940<sup>18</sup> passed 'an Act to provide for the payment of compensation by employers of male workmen who are certified to have been employed for periods amounting in the aggregate to not less than twenty years in cotton card rooms or other specified parts of factories engaged in the spinning of raw cotton and to have died from or become totally and permanently incapacitated for work as the result of, the respiratory disease known as byssinosis'.

From the results of the work in this laboratory it seems logical to assume that the cotton bacterium or its toxin, responsible for illness among rural mattress makers, may also be the etiologic agent responsible for illness among cotton mill workers. As far as can be determined, there is no permanent pulmonary injury following several attacks of the illness as it occurred in this laboratory. However, if a person had repeated attacks of this illness over a period of years, there is a possibility that permanent pulmonary changes would occur.

The illness among rural mattress makers also resembles heckling fever, reported in workers inhaling flax dust, mill fever in workers inhaling jute dust and grain fever in workers inhaling grain dust. It is possible that these diseases may be caused by the cotton bacterium or a related species of organism.

Further studies on the relationship of the cotton bacterium to Monday fever and to byssinosis, on the normal habitat and distribution of the cotton bacterium, its development on cotton, on the isolation and identification of the endotoxin and on methods for the protection of workers are needed. This is especially true in view of the fact that reports of outbreaks of illness in the upholstering industry and in cottonseed processing plants are being received continually. Other reports dealing with the technical phases of this investigation are being prepared for publication.

#### SUMMARY

This report deals with an acute illness occurring among workers in rural mattress making projects, in a cotton mill and in cottonseed processing plants in which the workers were exposed to high concentrations of stained cotton dust. Hundreds of cases of this illness occurred during the spring and summer of 1941. Outbreaks of this disease ceased when protective respiratory apparatus was used by the workers or when the use of the low grade, stained, dusty cotton was discontinued. Reports of outbreaks of this illness are being continually received from upholstering and cottonseed processing plants in which stained cotton is used.

Fifty-eight samples of stained cotton known to have caused illness, 3 control samples of cotton not known to have caused illness and 6 samples of dust from cotton mills in which illness had occurred were submitted to physical, chemical, mycologic, bacteriologic, serologic and biologic studies.

All samples of cotton incriminated in outbreaks of illness consisted of low grade dusty, stained cotton. Chemical examination of the samples did not reveal any

chemical substance capable of producing the disease. The low incidence of fungi and the infrequent occurrence of pathogenic types of fungi precluded this class of micro-organisms as the cause of the illness.

Bacteriologic examination of all samples of stained cotton and stained cotton dust known to have caused illness revealed an incidence of gram-negative, rod shaped bacteria ranging from 3 million to more than 10 billion per gram. These organisms occurred to the exclusion of any significant numbers of other types of bacteria on potato-carrot-dextrose agar. The micro-organism could be demonstrated on the outside of and within the lumen of individual cotton fibers. This organism was not recovered from the high grade or normal cotton. The characteristics of this organism tentatively place it in the genus *Aerobacter*.

The bacteriologic examination of 17 additional control samples representing practically all grades of cotton did not reveal the cotton bacterium in the various grades of white cotton. However, the cotton bacterium was recovered from all grades of yellow stained cotton and from one grade of tinged cotton.

Positive Shwartzman, Dolman and Hammon tests demonstrated the presence of a toxic substance in filtrates of extracts of the stained cotton and in filtrates of broth cultures of the organism isolated from it. Serologic studies demonstrated that homologous antibodies could be produced in rabbits through injection with cultures and culture filtrates of the cotton bacterium and with filtrates from extracts of stained cotton. A significant antibody titer could not be demonstrated in the blood serum from human beings and animals exposed to stained cotton under the conditions described herein.

Six species of experimental animals exposed by inhalation to stained cotton dust for several daily seven hour periods did not develop any significant symptoms of illness. The micro-organism had a low pathogenicity for experimental animals.

The same type of disabling illness was produced experimentally in human beings by inhalation of (a) dust from normal cotton contaminated with the cotton bacterium and its culture filtrates, (b) dust from stained cotton containing a high incidence of the cotton bacterium and (c) a fine mist of a sterile filtrate from cultures of the cotton bacterium. Similar exposures of persons to dust from normal cotton and to a mist of sterile tryptose broth failed to produce any signs or symptoms of illness.

The cotton bacterium was recovered from nose and throat swabs only in a limited number of cases. Blood cultures were negative in all cases.

Intradermal injections of the filtrates of stained cotton extracts and culture filtrates of the cotton bacterium in man were primarily toxic, producing severe, inflammatory lesions. Patch tests with various cotton samples and with chemical fractions of these samples were negative.

The clinical manifestations developed experimentally in human beings were the same as those reported in rural mattress makers and in workers in a cotton mill and in cottonseed processing plants. The clinical syndrome of this illness is similar to that of an acute intoxication.

This illness is characterized by its sudden onset, one and one-half to three hours after exposure, and its short duration, i. e. twenty-four to forty-eight hours. The subjective symptoms are headache, cough, general-

ized aches, dryness of the throat, joint pains, tightness of the chest, weakness, drowsiness, chills, conjunctival irritation, fatigue, nausea, vomiting, diarrhea, dyspnea, irritability, brassy voice, sneezing, insomnia, vertigo, anorexia, burning on urination, nervousness, palpitation, muscle tremor and abdominal discomfort. These subjective symptoms are accompanied by an elevation of temperature, increased pulse rate and sudden high leukocytosis, with a moderate increase in band and segmented cells.

This illness resembles mill fever, Monday fever and gin fever in cotton mill workers. It is possible that the cotton bacterium or its toxic products may be responsible for these diseases. It is also possible that repeated exposure over a period of years to this organism or its products contained in cotton dust may be a contributing factor in byssinosis.

#### CONCLUSIONS

The acute illness among rural mattress makers is caused by the inhalation of a gram-negative, rod shaped micro-organism or its products contained in or on dust from stained cotton. The severity of the symptoms and physical manifestations in this illness are dependent on the presence and concentration of the cotton bacterium or its products in the cotton dust inhaled and on the duration of exposure.

## OBSTETRIC SIGNIFICANCE OF BARBITURATES AND VITAMIN K

J. E. FITZGERALD, M.D.

AND

AUGUSTA WEBSTER, M.D.

CHICAGO

It is well known that various types of hemorrhage in the newborn account for a considerable percentage of stillbirths and neonatal deaths. Bundesen and others<sup>1</sup> reported that there were 237 deaths from intracranial hemorrhage among 2,260 neonatal deaths in 1936 and 1937. In an endeavor to decrease the percentage of stillbirths and to decrease mortality and maldevelopment in the newborn, we have studied the effect of vitamin K administered in various ways to women in labor or administered directly to the newborn.

In a previous article<sup>2</sup> we reviewed the history of vitamin K and appended an extensive bibliography. The cases cited in that article are included in this report. The methods of determining the prothrombin were the same for the whole series, namely a modification of the Smith bedside technic for determination of prothrombin in maternal and cord blood and the micro method of K<sub>1</sub> and Poncher for determinations on infants' blood obtained by heel puncture.

One hundred and fifty-seven women had prothrombin determinations made during labor. The aver-

All the vitamin K used in this study was furnished by the Laboratories, North Chicago, Ill.

From the Department of Obstetrics, Cook County Hospital, Department of Obstetrics and Gynecology, Northwestern University Medical School.

This study was made possible by a grant for research arranged by Dr. Herman N. Bundesen, president of the University of Chicago.

1. Bundesen, H. N., Fishbein, W. I., Dahms, O. A., Fox, F. J. and Volke, Walter. Factors in Neonatal Deaths. *J. A. M. A.* 114: 134-141 (July 9) 1938.

2. Fitzgerald, J. E. and Webster, Augusta. Effect of Vitamin K Administered to Patients in Labor. *Am. J. Obst. & Gynec.* 40 (Sept.) 1940.

was 97.1 per cent of normal. The same 157 mothers had determinations done at the time of delivery. The average then was 96.7 per cent of normal, so it is apparent that labor has no influence on the maternal prothrombin.

The average prothrombin of the babies of these 157 mothers was 130.6 per cent of the adult normal. The determinations were all done on cord blood by the technic used on the maternal blood. The comparative elevation in the cord blood prothrombin was noted in each group discussed in this article (chart 1).

Three hundred mothers were then given vitamin K orally with 10 grains (0.6 Gm.) of bile salts during labor. Of these 88 were given a vitamin K concentrate (from alfalfa) in peanut oil (klotogen) in doses of 4,000 Almquist units and 212 were given the synthetic product menadione (2-methyl-1, 4-naphthoquinone) in doses of 8 mg., 41 in a compressed tablet and 171 in sesame oil in a gelatin perle. The type of medication made no difference in the results. The maternal prothrombin on entrance averaged 98.3 per cent of normal. The average maternal prothrombin at delivery was 114.3 per cent, showing a definite rise for the treated patients. The time of administration varied from fifteen minutes to twenty-seven hours before delivery. The maternal prothrombin seemed to be definitely affected even if the medication was given shortly before delivery, since to 28 women the drug was given one hour or less before delivery and the prothrombin still averaged 110.3 per cent. To 9 of these women the medication was given thirty minutes or less before delivery, and the prothrombin was 100 per cent of normal, indicating that such late oral administration is without value. The prothrombin time for 12 patients to whom the vitamin was given from fourteen to twenty-seven hours before delivery averaged 110.2 per cent, showing that there is a prolonged effect.

The average cord blood prothrombin for the babies whose mothers received oral medication averaged 161.4 per cent, showing a percentage gain of 23.5 as compared with the value for the babies whose mothers were untreated.

Two hundred and twenty-four mothers were then given the synthetic vitamin K 2-methyl-1, 4-naphthoquinone-3 sodium sulfonate in doses of 32 mg., equivalent to 2 mg. of menadione, during labor. Of these, 72 received the vitamin intramuscularly and 152 intravenously. For the group receiving the vitamin intramuscularly, the prothrombin averaged 95.8 per cent before medication and 112.4 per cent at delivery. For those receiving the vitamin intravenously it averaged 97.4 per cent on entrance and 115 per cent at delivery. The time of administration varied from fifteen minutes to twenty-four hours before delivery. With this type of administration, late medication was even more effective. For 22 mothers given the vitamin fifteen to thirty minutes before delivery, the prothrombin at delivery averaged 110.7 per cent, and the rise was maintained in patients treated twelve to twenty-four hours before delivery. The babies of these mothers showed a uniformly high cord blood prothrombin content. The prothrombin of the babies whose mothers were given the preparation intramuscularly averaged 158.6 per cent, and that of the babies whose mothers were treated intravenously averaged 160 per cent.

Forty-three mothers to whom  $7\frac{1}{2}$  grains (0.5 Gm.) of sodium pentobarbital orally or 1 Gm. of sodium amyl

bromoalyl barbiturate rectally was given as a first stage analgesic were then studied. Before the administration of the drug the prothrombin averaged 97 per cent of normal. At delivery the maternal prothrombin averaged 84.5 per cent, showing a definite decrease in the blood coagulability in patients so treated.

The babies of these 43 mothers showed an average prothrombin of 90 per cent, a level considerably below that of babies whose mothers had had no such medication.

Twenty-two mothers given these barbiturates as analgesics were also given vitamin K while in labor. On entrance the prothrombin of these mothers averaged 96.8 per cent of normal, and at delivery it averaged 106 per cent of normal, suggesting that the drop in prothrombin content due to barbiturates can be prevented by the use of vitamin K during labor.

The babies of these mothers showed an average cord blood prothrombin of 140 per cent, which is about the reading for babies whose mothers had no medication at all and a striking increase over the reading for babies whose mothers had the barbiturates without vitamin K.

The effect of barbiturates on postpartum women was then investigated. One hundred and one women had prothrombin determinations after delivery. The aver-

Chart 1—Average prothrombin readings in each group studied

age value was 98.9 per cent of normal. These women were given 3 grains (0.18 Gm.) of sodium pentobarbital on their first postpartum night, and their prothrombin levels were checked the next morning, when the average had fallen to 87.8 per cent. A similar group of 64 averaged 98.5 per cent at delivery and were given 6 grains (0.36 Gm.) of sodium pentobarbital their first postpartum night. The next morning their average prothrombin was 84.7 per cent of normal. Thus, three separate groups of women were treated with barbiturates. Each group showed approximately the same prothrombin level before medication, and each group showed a definite decrease in the prothrombin level a few hours after medication. The infants born to mothers of one of these groups showed a striking decrease in cord blood prothrombin when compared with babies born to mothers who did not receive barbiturates.

We then studied the prothrombin curve of babies of various groups for six days after birth. The first day readings for all these babies differed decidedly from the cord blood readings. This difference may be accounted for by three factors: 1. The determinations were made on heel blood drawn about twelve hours after birth. 2. The determinations were all done by the micro method of Kato and Poncher instead of by the modification of the Smith bedside technic used on the mothers' blood and on the cord blood. 3. The blood used in the

micro method must be oxalated before the determination is made, while in the macro method whole untreated blood is used

To establish a daily normal for babies by the micro method of Kato and Poncher, the blood of 50 babies was checked at the end of each of the first six days of life by this method. The average for the six days was 73.8, 59.1, 59.5, 67.3, 75.0 and 78.9 per cent (chart 2)

For 32 babies whose mothers had vitamin K orally the average was 87.7, 89.3, 87.8, 94.0, 94.7 and 99.8 per cent

For 54 babies whose mothers had synthetic vitamin K intravenously or intramuscularly the average was 86.5, 84.7, 91.5, 94.1, 98.7 and 103.6 per cent

For 28 babies whose mothers had barbiturate analgesics with no other medication the average was 53.1, 38.6, 38.0, 51.4, 72.1 and 75.0 per cent (chart 3)

For 12 babies of mothers who had barbiturate analgesics but who were also given vitamin K during labor the average was 86.4, 87.6, 91.4, 95.4, 98.0 and 101.0 per cent

Many observers have noted that the prothrombin of infants drops from the second day of life until the fifth or sixth, when it gradually becomes normal

made before the baby was given the vitamin. The daily averages were 75 (before), 95.4, 96.3, 102.0, 103.7 and 106.3 per cent, which shows rather conclusively that the drop in prothrombin of such infants can be prevented by intramuscular injection of vitamin K after birth (chart 4)

The neonatal drop in the prothrombin is more striking than the figures alone show. Three babies of untreated mothers were dropped from the control series because of clinical evidence of bleeding plus a low prothrombin, which made immediate administration of vitamin K seem necessary. One of these had coffee ground vomitus on the second day, and the prothrombin was 56 per cent. Vitamin K was administered to the baby, and the next day the prothrombin was 87 per cent and the symptoms had disappeared. The other 2 had continuous bleeding from the heel puncture. 1 on the third day, with a prothrombin of 15 per cent and the other on the fourth day, with a prothrombin of 19 per cent. Vitamin K was administered, and the next day the symptoms subsided and the prothrombin had risen to 80 per cent and 87 per cent, respectively.

Of 30 control babies of mothers who had barbiturate for analgesia, 5 were withdrawn on various days because

Chart 2—Average daily prothrombin of babies from mothers with no medication and from mothers who had vitamin K orally or parenterally

Chart 3—Average daily prothrombin of babies from mothers who had sodium pentobarbital or sodium amyl bromoalyl barbiturate as first stage analgesic

Chart 4—Average daily prothrombin of babies given vitamin K after birth

Our figures tend to bear out their observations. It is also generally known that true hemorrhagic disease of the newborn begins during this period. Many milder forms of this tendency may occur and be unrecognized during the same time. Under these circumstances it may seem wise to prevent the lowering of the prothrombin, since this can be accomplished easily by the administration of vitamin K to the mother up to a short time before delivery. This procedure seems even more reasonable in cases in which the mother has been given sodium pentobarbital as an analgesic when the prothrombin of the mother and of the baby at delivery are depressed and the prothrombin of the baby after birth remains strikingly below that of a baby whose mother has had no such analgesic.

In an effort to discover whether we could prevent the neonatal decrease in prothrombin in cases in which the mother has not been given vitamin K during labor, we gave 50 babies of such mothers 1 mg. of synthetic vitamin K intramuscularly during the first day of life. Daily readings were made for six days by the micro method of Kato and Poncher, the first reading being

of hematoma and continuous oozing at the site of the heel puncture. The mothers of 4 of these had received sodium pentobarbital and the mother of 1 had received sodium amyl bromoalyl barbiturate. All these babies improved promptly after the administration of vitamin K, the prothrombin rose rapidly and the rise was maintained.

Seven other babies were called to our attention because of bleeding. These infants were not included in the series originally. All were babies of untreated mothers, and the prothrombin was not determined until after the onset of symptoms. One baby on the third day was bleeding from the nostrils and had conjunctival hemorrhages, coarse tremor of the extremities and severe cyanosis of the face. There was no rise in five minutes. The diagnosis made by the department of pediatrics was hemorrhagic disease of the newborn with possible cerebral hemorrhage. One milligram of synthetic vitamin K was given to the baby intramuscularly, and one hour and fifteen minutes later the prothrombin time was one and one-half minutes (prothrombin percentage, about 20), but the nasal hemorrhage

controlled. Another milligram of synthetic vitamin K was administered, forty-five minutes later the prothrombin was 63 per cent of normal, and there was no further bleeding. The following day the prothrombin level was 90 per cent and there were no symptoms. One baby showed vaginal bleeding and jaundice on the third day, with a prothrombin of 35 per cent. One had coffee ground vomitus on the third day, with a prothrombin of 36 per cent. One baby on the fourth day showed a large fluctuant bluish mass on the right cheek, numerous petechial hemorrhages on the palate, a small bluish area on the left cheek and a prothrombin of 10 per cent. A diagnosis of hemorrhagic disease of the newborn was made by the department of pediatrics. One baby showed evidence of intracranial damage on the fifth day, with a prothrombin of 21 per cent. Another showed palatal bleeding on the fifth day (trauma?) and a prothrombin of 10 per cent. One showed coffee ground vomitus on the fifth day, with a prothrombin of 15 per cent. All showed a marked increase in the prothrombin and cessation of bleeding promptly after the administration of vitamin K intramuscularly.

It is interesting to note that in none of the 641 babies whose mothers had vitamin K during labor was there any evidence of neonatal hemorrhage.

#### SUMMARY

Evidence is presented from a large series of cases to show that

- 1 The administration of vitamin K, either the original alfalfa extract or the synthetic product, to a mother in labor increases the percentage of prothrombin of both mother and child. The vitamin may be given orally or parenterally.

- 2 Such medication also prevents the drop in the prothrombin level of the baby which normally occurs from the second to the fifth day.

- 3 The administration of sodium pentobarbital or sodium amyl bromoalyl barbiturate as an analgesic definitely decreases the prothrombin level in mother and child.

- 4 The decrease can be prevented by the administration of vitamin K to the mother during labor.

- 5 It is apparent that even small doses of barbiturates effect the prothrombin level.

#### CONCLUSIONS

- 1 It seems reasonable to assume that hemorrhage is more likely to occur in the presence of a low prothrombin level.

- 2 There is a normal depression of the prothrombin level of the newborn from the second to the fifth day. This depression is much greater when certain analgesics are administered to the mother during labor.

- 3 This depression can be prevented by the administration of nontoxic vitamin K to the mother while she is in labor.

- 4 Such medication should prove effective in lowering the incidence of hemorrhage of the newborn.

- 5 It seems particularly desirable that vitamin K should be administered when barbiturate analgesics are used.

104 South Michigan Avenue

## THROMBOPHLEBITIS IN THE FOOT

### A LITTLE KNOWN LOCALIZATION

KARL HARPUDE, M.D.

AND

IRWIN D. STEIN, M.D.

NEW YORK

Thrombosis of the veins in the foot were found with great frequency by Neumann<sup>1</sup> in his recent anatomic study. In fully 71 per cent of his patients with positive manifestations in the veins of the lower extremities (100 out of 165 unselected cases coming to surgery) there was also evidence of involvement of the venous channels in the foot either alone or in combination with a similar process in more proximal regions.

These anatomic figures are striking, especially in the absence of clinical reports on the subject. Although there undoubtedly are many instances of so-called silent thrombi in the foot (as well as elsewhere) which produce neither signs nor symptoms, the paucity of clinical reports cannot be explained on this basis.

In the past eighteen months, however, since our interest has been focused on the condition the diagnosis of thrombophlebitis in the foot has been made in 10 instances.

#### REPORT OF CASES

CASE 1—C. H., a woman aged 63, who had diabetes and advanced peripheral vascular disease of the arteriosclerotic type, had been confined to her wheelchair for many months. She complained of severe pain in the right foot which came on suddenly and persisted for about four weeks before an explanation for it could be found. In the midtarsal region of the right foot there was an infiltrated, tender, cordlike structure along the course of the lateral plantar venous arch. Outlining its course in the skin was a linear bluish discoloration. The surrounding area was puffi and red and the entire right foot was warmer than the left. There was no edema present and no signs of an ascending thrombosis. Large superficial varicosities were present in the right calf.

CASE 2—M. M., a woman aged 25 because of a severe attack of grip had been confined to bed for five weeks. As soon as she started to walk, pain and swelling of both feet developed. Examination revealed a hot, infiltrated, tender area 3 inches by 3 inches (7.5 by 7.5 cm.) over each instep. At subsequent examinations when signs of acute inflammation had subsided, a cordlike structure could be felt running parallel to the long axis of the foot.

CASE 3—M. B., a woman aged 63, had had a corn on the sole of her foot removed by a chiropodist four months before admission. A mild inflammatory reaction persisted for about a week when she suddenly experienced pain on the inner side of her right ankle. This had persisted since and was increased with walking. The inner aspect of the ankle was warm and swollen. Pitting edema was present in the lower leg. There was great tenderness over the internal malleolus, especially along the course of the posterior tibial vein. Surrounding this region was an area of inflammation about 3 inches in diameter. Tenderness was present in both calves, but there were no other signs of venous involvement. As the signs of acute inflammation subsided a cordlike structure could be clearly outlined behind the internal malleolus.

CASE 4—F. K., a man aged 59, known to have polycythemia vera, had been seen repeatedly by several physicians who could give no adequate explanation for the pain he complained of in the sole of his right foot especially since arch supports proved of little benefit to his flat feet. The pain was present on and off for at least four years becoming more severe on weight

From the Montefiore Hospital  
1 Neumann R. Ursprungszentren und Entwicklungsformen der  
Benthrombose. Virchows Arch. f. path. Anat. 301: 708-735, 1930.

bearing or walking. Pitting edema of both legs had been noticed for a long time. The superficial veins of the right foot and leg were distended. Infiltrated, cordlike structures could be palpated, not only in the foot but in the calf and the thigh as high up as the fossa ovalis. The whole foot varied from a dusky red to a purplish hue, depending on the position of the limb.

CASE 5—E. R., a woman aged 45, who was actively engaged in business, had a severe respiratory infection which kept her in bed for several weeks. Shortly after resuming her usual activities she noticed pain in both her feet. On the left the pain was present in the entire foot as well as in the lower calf. It was especially severe on walking. Behind the medial malleolus a tender cordlike structure about 3 inches in length could easily be palpated, this was outlined on the skin by a purplish discoloration. Extension into the left calf was not demonstrable.

CASE 6—N. H., a woman aged 60, gave a history of having had pain in both legs for many years, relieved by wearing arch supports for her flat feet. Three weeks prior to our examination great pain in her right foot developed. This radiated up to the calf, making walking difficult. On examination, slight pitting edema of both feet and lower legs was present, more on the right. The dorsum of the right foot was puffy, and there was an area of redness and superficial tenderness on the tarsus 2 to 3 inches in diameter. The bones in the foot were not tender on pressure. There was tenderness in the region of the midcalf, and a deep cordlike structure could be felt in it. Local examination was otherwise negative. Interestingly enough, the patient gave a history of bilateral phlegmasia alba dolens many years before during pregnancy.

CASE 7—F. G., a woman aged 65, had a history of long-standing peripheral vascular disease due to arteriosclerosis and diabetes mellitus. One leg had already been removed at the midcalf on the right side. She had been confined to a wheelchair for at least four months when tenderness was noticed along the course of the left saphenous vein in the thigh. This was diagnosed as thrombophlebitis. Pain and some induration persisted for about two months. She then began to complain bitterly of severe pain in the left foot posterior to the metatarsal arch. Tenderness was present and a cordlike infiltration could be felt in the region of the instep extending upward behind the medial malleolus into the calf. Within the next two weeks this tenderness had extended upward along the course of the saphenous vein to the region of the midthigh.

CASE 8—E. McC., a man aged 36, an employee of the hospital, had injured his foot the day before in tripping. The skin on the medial aspect of the instep was red and warm over an area 2 inches in diameter. A cordlike vein running from this point to the medial side of the foot could be felt. There was great tenderness on pressure. The next day the thrombosis had spread even higher to involve the region of the calf.

CASE 9—G. P., a man aged 65, had undergone two major operations in the past four months. Shortly after he was permitted up swelling of the right foot developed. Although the swelling was considered at first to be a strain, medical advice was sought after it had persisted for more than three weeks. Examination showed varicosities in both lower legs, although they had been injected several years previously. There was swelling of the entire right foot and ankle. Varicose eczema was present in the lower leg. There was tenderness on pressure over the inner side of the foot along the course of the medial plantar arch. Thrombosed veins could not be felt because of the edema. The entire right foot was warmer than the left.

CASE 10—M. G., a girl aged 17½ years, had experienced pain in both feet for almost three months. Examination revealed marbleization of both lower extremities and moderate swelling of the feet and ankles. Over the lateral aspect of the left ankle there were patches of brownish, scaly, varicose eczema. Extreme tenderness was caused by pressure over the deep veins in the left sole, as well as along their course behind the medial malleolus and up to the left calf. In this region, a cordlike structure was easily palpable. The same areas in the right

lower extremity were also tender but to a much less degree. The peripheral arterial pulses were patent, although the skin was cold. There was moderate pes planus bilaterally.

#### COMMENT

It is not our intention in this paper to draw up statistical figures or make generalizations from an admittedly small group of cases. However, thrombosis of the veins in the foot is obviously not a rare occurrence, neither does there appear to be anything peculiar about its etiology. In the cases presented, one can discern some of the usual agents responsible for the condition—gripping infections, trauma and systemic diseases such as polycythemia vera. The inevitable conclusion is that the diagnosis is not made simply because the possibility of a venous thrombosis in this region is not considered. As a result, the symptoms are attributed either to muscle or tendon strain or to other injuries, to inflammations of the bursae or tendon sheaths, to acute static disturbances like flat feet, to gout and even to the pressure of neurofibromas.

Many patients have flat feet, so that their presence provides a ready pitfall in diagnosis. It is likely, however, that weak or flat feet may favor phlebothrombosis by causing an alteration in the architecture of the veins of the foot. In connection with this, Wright<sup>2</sup> has observed 5 instances of phlebitis of the dorsal foot veins of persons who lace their shoes too tightly. He feels that obstruction and trauma to the venous arches in this region is the probable cause.

Most persons had been confined to bed for other illnesses just prior to the appearance of symptoms in the feet. This fact had been reemphasized by Hunter<sup>3</sup> as being too frequent to be considered a coincidence. Inactivity, especially in older persons, disturbs the return flow of blood and favors thrombus formation.

Another point about diagnosis which must be stressed is that inflammatory processes starting in the veins of the foot seem at first to be diffuse processes of cellulitis. This is because the thick skin covering the sole masks individual landmarks. Occasionally, edema may be the only presenting sign. With subsidence in the inflammatory reaction, and with the disappearance of the edema, the thrombosed veins may frequently be felt as cordlike structures in the subcutaneous or deeper tissues.

The diagnosis becomes quite definite if the process spreads upward to the ankle or calf. Occasionally, in the more superficial veins, a discoloration of the skin, perhaps of linear outline, can be seen over the involved area. In such cases<sup>4</sup> the clinical appearance is certainly characteristic.

It is most important to make a correct diagnosis because the veins of the foot, like other veins in the extremities, or the prostatic or pelvic network of veins, are frequently a source of malignant but clinically unexplainable embolization. In such instances proper therapeutic measures<sup>5</sup> might prevent or retard the development of these complications.

#### SUMMARY AND CONCLUSIONS

Ten cases of thrombophlebitis of the veins of the foot were seen and diagnosed within a period of 2½ and a half. The condition has hitherto been

## Clinical Notes, Suggestions and New Instruments

### CARCINOMA OF THE PROSTATE TREATED WITH DIETHYLSTILBESTROL

#### HISTOLOGIC ALTERATIONS

NORRIS J. HECKEL, M.D. AND HERMAN L. KRETSCHMER, M.D.  
CHICAGO

The observations recorded here are of interest because of the histologic changes that occurred in the prostate gland during the administration of diethylstilbestrol.

W. E. H., a white man aged 59, entered the Presbyterian Hospital on April 8, 1941 complaining of intermittent hematuria, difficulty in urination, backache, leg pains, loss of appetite, loss of weight and fatigue. These symptoms had become gradually worse during the past two years, and for the past six weeks he had relieved his urinary retention by daily catheterizations.

Three years before a transurethral resection was done in another hospital for the relief of urinary obstruction. He had had an increasing amount of pain in the lower lumbar region associated with sharp pains down the right thigh for the past seven months, and the intensity of these pains had increased to such an extent that it had become difficult for him to get around. During the past three weeks he had lost 20 pounds (9 Kg.), and the present weight was 149½ pounds (68 Kg.). There were no other details of consequence in the past history.

Fig. 1—Section of the prostate gland before treatment.

The patient was thin, poorly nourished and anemic. Rectal examination revealed a firm, large, nodular prostate characteristic of carcinoma.

He had a well defined secondary anemia. The hemoglobin amounted to 8.8 Gm. per hundred cubic centimeters by the Dick-Stevens electric method, and the red blood cell count was 2,900,000 and the white count 8,000. The total nonprotein

nitrogen was 34 mg. per hundred cubic centimeters of blood. A Wassermann reaction was negative. His blood pressure was 130 systolic, 82 diastolic. The urine was turbid from pus cells. He had 400 cc. of residual urine when admitted to the hospital.

The retention of urine was treated with an indwelling urethral catheter for a week, and then a transurethral resection was done. Previous to the operation a blood transfusion of 500 cc.

Fig. 2—Section of the prostate gland after patient had received 1,546 mg. of diethylstilbestrol in two hundred and twenty-three days.

was given. Eight days after the operation he left the hospital. He had no difficulty in voiding, and there was no residual urine.

The microscopic study of the tissue removed from the prostate gland showed adenocarcinoma grade 3, as shown in figure 1. The following histologic report was by Dr. C. W. Apfelbach, pathologist. In pieces of tissue removed from the prostate gland there was widespread epithelial neoplasm, a portion of which grew diffusely through smooth muscle and fibrous tissue without any definite pattern. In other regions the tumor had a definite organoid pattern, consisting of small alveolar structures. In one section there was hyperplasia of the acinar elements.

Three weeks after leaving the hospital the patient was put on daily doses of diethylstilbestrol, beginning with 3 mg. and increasing up to 12 mg. Within ten days he began to show decided clinical improvement. His appetite improved, he gained in weight, his leg and back pains disappeared and his anemia improved. At the end of six months his weight had reached 175 pounds (79 Kg.), and this he has maintained. The induration of the prostate and the periprostic region appeared to be much softer on rectal examination. While he had no urinary symptoms, his urine continued to show a few pus cells.

At the end of two hundred and twenty-three days, during which time he had received 1,546 mg. of diethylstilbestrol, he was readmitted to the hospital for two days and pieces of prostatic tissue were removed by transurethral resection for a comparative study. The histologic report by Dr. Apfelbach was as follows: In pieces of tissue removed from the prostate gland there was widespread alteration in the neoplastic cells, characterized chiefly by hydropic degeneration and vacuolation (Fig. 2).

#### COMMENT

It is difficult to explain how the histologic changes that occurred in the prostate gland could be due to anything except the administration of the diethylstilbestrol. The patient had no other form of therapy. His general clinical improvement and the fact that the prostatic cancer as determined by numerous rectal examinations, gradually became softer while the patient was under treatment would fit in with the histologic changes that occurred in the prostate gland.

## RENAL INFARCTION OF TRAUMATIC ORIGIN

HOWARD A. HIRSHBERG, M.D.

Captain, M. C., U. S. Army

AND

SIDNEY N. SOLL, M.D.

First Lieutenant, M. C., U. S. Army

CAMP ROBERTS, CALIFORNIA

Renal infarction in itself is not unusual. Its occurrence as the direct result of trauma is rare. Of 376 cases, in the great majority of which renal infarction was secondary to cardiac disease, in only 2 was it due to trauma. In Aschner's review,<sup>1</sup> von Recklinghausen is quoted as reporting the autopsy of an 8 year old boy who died eight days after a severe fall. The left renal artery showed a circular injury in the wall. Distal to this there was extensive thrombosis of all branches, and there was complete necrosis of the kidney. Barney and Mintz,<sup>2</sup> in their study of Massachusetts General Hospital protocols, found a similar instance of a man who died eight days after a fall on his back. The clinical picture was that of ruptured kidney, with shock, hematuria and the finding in the right flank of a mass. At autopsy a large infarct of the right kidney was found, secondary to thrombosis of all vessels of the kidney.

## REPORT OF CASE

**History**—H. C., a white man aged 48, a CCC employee, brought to the station hospital at 3 p. m. on Dec. 2, 1941, complained of severe left costovertebral angle pain and hematuria.

Three days previous to his entry, he sustained a back injury when the truck in which he was riding turned over. He fell for a distance of about 3 feet, landing on his left side. There was no loss of consciousness, but severe pain occurred in his left flank and costovertebral angle which persisted throughout the next few days. Four hours after the injury he urinated bright red blood. He was admitted to the CCC Hospital and observed. The pain in his flank continued, and a mass appeared. The blood in the urine persisted, and the patient was transferred to this hospital.

**Examination**—On admission the patient appeared quite ill and in considerable pain. His temperature was 99.8 F., his pulse rate 104 and his blood pressure 138 systolic and 88 diastolic. There was no evidence of cyanosis or pallor, but the patient was perspiring freely. The cardiovascular system was essentially normal. Posteriorly at the bases of the lungs, most pronounced on the left, were many coarse sticky rales. There were no changes in percussion resonance. In the left flank, extending posteriorly from the twelfth rib to the crest of the ilium, was a large firm fixed mass, excruciatingly tender. The skin over this area was considerably abraded. There was no suprapubic swelling or tenderness. Some dried blood was noted on the external genitalia. The prostate gland was normal.

On admission, the red blood cell count was 4.1 million, with 85 per cent hemoglobin. Repeated urinalyses revealed several pus cells and innumerable red blood cells. An abdominal flat roentgenogram revealed normal renal and psoas shadows on the right, but both renal and psoas shadows were obscured on the left. Considerable gas distended the bowel.

**Course**—The patient was observed carefully for two days. The blood count did not vary from the admission level. He continued to have gross hematuria. The mass appeared to be somewhat larger and more indurated. The blood pressure began to drop slowly until on December 4 it was 112 systolic and 68 diastolic. The temperature rose to 101.2 F. On December 4 an intravenous urogram was done, which revealed excellent contours and function of the right kidney. The left kidney was not visualized and no dye was secreted in thirty minutes. A diagnosis of ruptured kidney with interference of the renal blood supply was made, and the patient was operated on.

Immediately after spinal anesthesia the patient's pulse became imperceptible and the blood pressure could not be recorded. Intravenous fluids and restorative measures brought the blood pressure up to 108 systolic and 60 diastolic and the operation

was continued. The usual modified Israel kidney incision was made. The perinephric space was found considerably indurated with fluid and blood. The tissues were very friable. Large clots were found about the hilus. The kidney was freed with difficulty and removed. The pedicle was found to be intact. There was a considerable area of hemorrhage about the hilus and peripelvic fat. In one area over the cortex a small tear was noted, but the organ itself presented no laceration of consequence. The kidney had the diffuse dusky mottled appearance of infarction. The incision was closed in layers, sulfanilamide powder being used in the wound. The patient received an indirect transfusion of 500 cc. of whole blood and returned to the ward. The postoperative course was exceptionally good. The temperature returned to normal on the eighth day. The blood pressure remained at a fairly constant level averaging 140 systolic and 80 diastolic. On the eighteenth postoperative day the patient was up, and he was discharged on the twenty-eighth day.

**Gross Pathology Examination**—The specimen consisted of a slightly enlarged kidney, which had been previously sectioned and attached pedicle. The capsule and fragments of attached fatty connective tissue were somewhat hemorrhagically discolored. The most hemorrhagic staining, however, existed in the supporting tissues of the renal pedicle. The capsule stripped readily, revealing a slight rent in the anterior surface 1 cm. in diameter. The subcapsular surfaces were smooth and marked by several circumscribed pale gray areas, the largest 3 cm. in diameter. These on section were broadest in the cortex and tapered down toward the pelvis. The intervening surface everywhere were reddish pink to deep brick red.

**Microscopic Pathologic Examination**—In ten sections cut from different portions of the kidney normal tissue was not found at all. Various degrees of necrosis were seen from the earliest tendency toward poor staining and cytoplasmic swelling to complete loss of cellular and nuclear structure. The latter change predominated. Hemorrhage was evident, though patchy, masses of cells being found in interstitial spaces, tubules and glomeruli. A small amount of polymorphonuclear infiltration was also evident. The blood vessels were interesting, there being few, from small to large, that did not contain well formed thrombi. Section through the stump of the renal artery revealed early necrosis, with failure of the nuclei to take the stain well, fragmentation of the intima and underlying elastic lamellae. A fragment of thrombus was present in the lumen.

## COMMENT

The literature is uniform in its agreement on the difficulty in differential diagnosis between renal infarction and other surgical conditions of the kidney, whether due to stone or other causes. Various authors point out that local or systemic findings, urinalysis, cystoscopy and urography are usually unreliable in establishing the diagnosis and that only the detection of a primary cardiac lesion will direct attention toward renal infarction when due to embolism in such instances. However, when the cause of the infarction is local, as in our case, the factor of trauma points to rupture of the kidney, differential diagnosis seems impossible even in retrospect. The clinical signs and symptoms of the latter, i. e. history of trauma over the flank, local tenderness, fever, gross hematuria and absence of renal function as shown by the intravenous urogram were all present in this case. Granted that, through experience, suspicion of the presence of infarction may be aroused in similar cases in the future, differentiation of the two conditions is still not possible short of surgical intervention. Wood<sup>3</sup> has indicated that an intravenous urogram should not be made in all traumatic cases as soon as possible after injury and that a temporary anuria may occur in the first twelve hours. In the case reported the anuria was present on the fourth day following injury. Retrograde study is inadvisable because of the danger of secondary infection and embolism.

This case is presented because of the rarity of renal infarction of traumatic origin and because of the signs and symptoms which suggested ruptured kidney.

## Special Article

### PRIMER ON ARTHRITIS

PREPARED BY A COMMITTEE OF THE AMERICAN RHEUMATISM ASSOCIATION EDWIN P. JORDAN, M.D., CHICAGO, CHAIRMAN, WALTER BAUER, M.D., BOSTON, RALPH H. BOOTS, M.D., NEW YORK, RUSSELL L. CECIL, M.D., NEW YORK, H. C. COGGESHALL, M.D., DALLAS, TEXAS, M. HENRY DAWSON, M.D., NEW YORK, PHILIP S. HENCH, M.D., ROCHESTER, MINN., I. ALBERT KEY, M.D., ST. LOUIS, L. MAXWELL LOCKIE, M.D., BUFFALO, GEORGE R. MINOT, M.D., BOSTON, RALPH PENBERTON, M.D., PHILADELPHIA, AND LORING T. SWAIN, M.D., BOSTON

#### INTRODUCTION

The American Committee for the Control of Rheumatism, cooperating with the Committee on Scientific Exhibit of the American Medical Association, published the first Primer on Rheumatism in 1934. Now additions to the scientific knowledge of the rheumatic diseases necessitate a thoroughgoing revision if it is to continue to serve as an accurate introduction to the subject.

One of the principal difficulties encountered by the clinician in the management of chronic arthritis has been the lack of understanding of the important points of differential diagnosis and insufficient knowledge of the pathologic and physiologic factors involved. In this discussion rheumatic fever and tuberculous arthritis have been omitted. After publication in *THE JOURNAL*, the Second Primer on Arthritis will be available in pamphlet form at a cost of fifteen cents.

#### HISTORY

Among the first of the disease entities of which there are any records is the syndrome of arthritis. Evidences of its ravages are to be seen in the small Triassic dinosaurs of 200,000,000 years ago. Throughout the ages arthritis is evident in fossil remains of succeeding geologic eras down to and including the age of manimals and the advent of man. It affected the ancient Egyptians and was one of the reasons for the extensive baths which the Romans built throughout their empire. Thus there has been ample opportunity to recognize the importance of the disease and to initiate steps to prevent or cure it.

#### INCIDENCE AND SOCIAL PROBLEMS

A recent survey, under the auspices of the United States Public Health Service, of the calculated incidence of certain diseases revealed that "rheumatism" affects, in any one year, a greater number of persons than are affected by heart disease or arteriosclerosis.

Tables 1 and 2 are instructive.

The number of persons disabled by rheumatic disorders during each year exceeds those affected by diabetes in a ratio of nearly ten to one, tuberculosis ten to one, cancer and tumors seven to one. From the standpoint of days lost from work, arthritis surpasses injury from accidents. The data for other countries is comparable to those for the United States. Among the working population of Berlin the number of days of disability from arthritis in 1927 was 3.4 times greater than that from tuberculosis. In England rheumatism causes one sixth of the total industrial disability, and one sixteenth of all moneys paid out by England for pensionable invalidity is devoted to rheumatic diseases. These figures take no account of persons other than

the insured population. Among chronic disorders in the United States, rheumatism is second only to mental and nervous diseases as a cause of days lost from work. The estimated cost of medical care alone for these cases exceeds \$100,000,000 annually. To this large sum there should be added an inestimable amount due to losses in production and education occasioned by disability among workers and students. While these disorders affect persons in all economic groups, it may be noted that over 50 per cent of the total number of days lost from work was accounted for by families with incomes of less than \$1,000 annually. During the first world war there was an estimated incidence of chronic arthritis alone in the United States Army of 60,000 cases a year for an army the size of ours at the end of hostilities. Among ex-service men 35,000 are disabled by arthritis at the present time and receive compensation to the extent of \$10,000,000 annually.

TABLE 1—*Estimated Prevalence of Specified Chronic Diseases in the United States (1937)*

| Disease  | Number of Cases |
|--|-----------------|
| Rheumatism   | 6 850 000       |
| Heart disease  | 3 700 000       |
| Arteriosclerosis and high blood pressure               | 3 700 000       |
| Hay fever and asthma                                   | 3 450 000       |
| Hernia   | 2 100 000       |
| Hemorrhoids  | 2 000 000       |
| Varicose veins   | 1 750 000       |
| Chronic bronchitis                                     | 1 700 000       |
| Nephritis and other kidney diseases                    | 1 550 000       |
| Nervous and mental diseases                            | 1 450 000       |
| Goiter and other thyroid diseases                      | 1 200 000       |
| Sinusitis  | 1 150 000       |
| Cancer and other tumors                                | 930 000         |
| Diseases of female organs                              | 720 000         |
| Tuberculosis all forms                                 | 680 000         |
| Diabetes mellitus                                      | 660 000         |
| Diseases of gallbladder and liver                      | 640 000         |
| Other diseases of the circulatory system               | 440 000         |
| Chronic tonsillitis and other throat disorders         | 380 000         |
| Ulcers of stomach and duodenum                         | 330 000         |
| Diseases of bladder and urethra                        | 270 000         |
| Chronic diseases of the skin                           | 270 000         |
| Anemia   | 240 000         |
| Chronic appendicitis                                   | 170 000         |
| Chronic diseases of the eye                            | 150 000         |
| Chronic diseases of the ear                            | 100 000         |
| Chronic pleurisy                                       | 90 000          |
| Diseases of the prostate and male genitourinary organs | 80 000          |

From Preliminary Reports the National Health Survey, Sickness and Medical Care Series Bulletin No. 6 U. S. Public Health Service Washington D. C. 1938

Perhaps the first organized attempt at study of the syndrome began in England with the Cambridge Committee for the Study of Special Diseases. Unfortunately this effort was curtailed by the outbreak of the first world war. The next step in development was the establishment in 1920 of the *Ligue Internationale contre le Rhumatisme*. This organization, then composed chiefly of European representatives, encouraged the formation in a number of countries of groups interested in the problem and qualified to study it. This movement extended to the United States, where there was formed in 1928 the American Committee for the Control of Rheumatism. This committee entered on active efforts to arouse the interest of the profession in the magnitude of the sociologic problem presented and to extend knowledge concerning it by means of publications and, especially, of extensive exhibits in connection with the Scientific Exhibit of the American Medical Association. In 1930 the desirability became apparent of organizing a national society for the study and control of rheumatic disorders and

the American Rheumatism Association was, therefore, founded. It consisted of a larger group of physicians interested in and qualified to study the syndrome of arthritis and allied topics. This society holds yearly meetings for the presentation of scientific papers and discussions, sponsors an extensive review of English and American literature, and in various other ways promotes wider interest and more extensive interchange of information concerning the problem. There are now also available to the profession, several journals devoted exclusively to the problem presented by rheumatic disease.

Under the auspices of the Ligue Internationale contre le Rhumatisme six international congresses have been held, the last of which was in England in 1938.

Among the various lines of progress in the field of rheumatic disease, one of the most encouraging is the

TABLE 2—Estimated Annual Number of Days Lost from Work or Other Usual Pursuits by Reason of Specific Chronic Diseases (United States, 1937)

| Disease  | Annual Number of Days Lost |
|--|----------------------------|
| Nervous and mental diseases                            | 132,500,000                |
| Rheumatism   | 97,200,000                 |
| Heart disease  | 95,200,000                 |
| Arteriosclerosis and high blood pressure               | 56,900,000                 |
| Tuberculosis, all forms                                | 41,400,000                 |
| Cancer and other tumors                                | 36,300,000                 |
| Nephritis and other kidney diseases                    | 28,400,000                 |
| Diseases of the female organs                          | 26,800,000                 |
| Hay fever and asthma                                   | 21,900,000                 |
| Diseases of gallbladder and liver                      | 20,000,000                 |
| Diabetes mellitus                                      | 19,200,000                 |
| Ulcers of the stomach and duodenum                     | 13,600,000                 |
| Hernia   | 13,600,000                 |
| Chronic diseases of the skin                           | 10,300,000                 |
| Anemia   | 8,500,000                  |
| Diseases of the bladder and urethra                    | 8,200,000                  |
| Chronic bronchitis                                     | 8,000,000                  |
| Chronic appendicitis                                   | 7,600,000                  |
| Goiter and other thyroid diseases                      | 7,600,000                  |
| Other diseases of the circulatory system               | 6,600,000                  |
| Sinusitis  | 6,000,000                  |
| Varicose veins   | 5,900,000                  |
| Chronic tonsillitis and other throat infections        | 5,400,000                  |
| Hemorrhoids  | 5,100,000                  |
| Chronic pleurisy                                       | 4,200,000                  |
| Chronic diseases of the eye                            | 4,200,000                  |
| Chronic diseases of the ear                            | 3,300,000                  |
| Diseases of the prostate and male genitourinary organs | 3,300,000                  |

From Preliminary Reports, the National Health Survey, Sickness and Medical Care Series Bulletin No. 6, U. S. Public Health Service, Washington, D. C., 1938.

greater attention now paid to the problem in the medical schools of the United States. There is a growing number of special clinics, research units and hospitals devoted to the care and study of patients with rheumatic diseases. Better evaluation of methods of treatment and a fuller understanding of the basic nature of the disease are being realized in these centers, but much still remains to be accomplished. Great significance attaches to arousing in the public mind appreciation of the disease as a social problem, the value of adequate treatment in the early stages and the importance of providing adequate institutional care for sufferers from it, not only in the late stages but throughout the disease.

CLASSIFICATION OF ARTHRITIS

Arthritis occurs in a number of different forms, depending on various etiologic agents. Some of the groups are characterized by certain pathologic and clinical features which make their differentiation compara-

tively easy. In other instances only the most careful study will determine the identity of the articular disorder.

Arthritis may occur in either an acute or a chronic form. However, almost any type of acute arthritis may pass into a subacute or chronic form, and many cases of chronic arthritis are subject to acute exacerbations.

The classification of arthritis would be much simplified if one knew the etiology of all the various types. Unfortunately this is not the case. Indeed, in the majority of cases the etiology of the particular disease cannot be definitely determined.

Roughly speaking, the great majority of the cases of arthritis fall into one or another of five groups: (1) the frankly infectious cases caused by a specific micro-organism, (2) cases that are probably infectious of unproved etiology, (3) the degenerative form of joint disease which in Europe are often spoken of as arthroses, (4) arthritis resulting from physical injury to the joint by trauma, (5) gouty arthritis. These are the five common divisions of arthritis, and under these main groups there are certain subdivisions. In addition to these five prevalent varieties, however, there are certain rare forms of arthritis, such as the tabetic joint and intermittent hydrarthrosis, which should be included.

1 *Infectious Arthritis of Proved Etiology*—This general heading includes all cases of arthritis due to infection in which the specific microbic cause can be proved. The individual arthritides are named according to the particular micro-organisms and joints concerned, e. g., pneumococcal arthritis of the left shoulder, tuberculous arthritis of the right knee, gonococcal arthritis of the knees and the like.

The micro-organisms most commonly responsible are the pyogenic cocci, the tubercle bacillus and *Treponema pallidum*, but many others may occasionally act as a cause of articular infection. Of the pyogenic cocci the hemolytic streptococcus, pneumococcus and staphylococcus usually cause a frankly suppurative arthritis which occurs during the course of septicemia or as other severe systemic infection caused by the agent.

2 *Probably Infectious Arthritis, Etiology Unproved*—Two of the main divisions of arthritis come under this heading: the arthritis of rheumatic fever and rheumatoid arthritis. Under rheumatoid arthritis one may include such clinical variants as Still's disease and ankylosing arthritis of Marie-Strumpell.

Rheumatic fever is still classified as a disease of unknown origin. However, authorities are pretty well agreed that the disease is due to infection, and many students are convinced that it is closely associated with hemolytic streptococcus infection.

Rheumatoid arthritis is probably a chronic infectious disease, but the specific agent has not yet been determined. Under this heading are included a majority of the cases of chronic progressive polyarthritis for which a specific cause cannot be discovered. The disease is characterized in its early stages by transient stiffness and swelling of the joints and in its later stages by deformities and ankylosis.

3 *Degenerative Joint Disease or Osteoarthritis*—Osteoarthritis represents a degenerative process involving both the cartilage and the adjacent bone. It is entirely different from the arthritis caused by actual infection of the joint. Some authorities regard degenerative arthritis as an arthrosis, and it

sion is quite general that the changes which occur in the cartilage and bone often result from prolonged or oft repeated trauma. Osteoarthritis may appear in a generalized or localized form. The disease is much commoner in middle-aged or elderly persons, though occasionally it is encountered (particularly in women) in the thirties.

4 *Arthritis Resulting from Physical Injury to the Joint by Trauma*—Injury may occur to the synovial membrane, the cartilage or any one of the ligaments. The ordinary sprained ankle is a good example of the trauma which can lead to this form of arthritis. If the results of trauma are not properly handled, the

traumatic arthritis may become chronic, but usually the condition heals rapidly.

5 *The Arthritis of Gout*—Gout is a disease of unknown origin, though it is commonly defined as a disturbance of purine metabolism. It is characterized by acute recurrent attacks of arthritis, each of which is followed by a complete remission. Later on, however, the arthritis may become chronic. In late gout deposits of sodium urate crystals, the so-called tophi, are frequently found in articular, periarticular and subcutaneous tissues. At least 95 per cent of gouty patients are men, and in many there is a history of gout in some other member of the family.

Many classifications of arthritis are already in use, both in this country and abroad. The classification given in table 3 has been approved by the Nomenclature Committee of the American Rheumatism Association and for inclusion in the Standard Nomenclature of Disease

## OTHER DISTURBANCES OF JOINTS

- I Disturbances of the joints secondary to abnormal postural strain
- II Disturbances of the joints secondary to lesions of bone
- III Primary neoplasms of the joints (e.g. cyst, xanthoma, hemangioma, giant-cell tumors, synoviomia)
- IV Disturbances of the joints associated with loose bodies
- V Disturbances of the joints secondary to functional or psychogenic causes

## RHEUMATOID ARTHRITIS

## ETIOLOGY

The cause of rheumatoid arthritis remains unknown. Although many theories (infectious, metabolic, endocrine, circulatory and neurogenic) have been proposed, not one of them has been generally accepted.

Many of the clinical features of rheumatoid arthritis (fever, tachycardia, leukocytosis, increased sedimentation rate, inflammation of the articular tissues, exudative characteristics of the synovial fluid and enlarged regional lymph nodes) suggest that it is an infectious disease. However, similar clinical features may be observed in gouty arthritis, which is presumably a metabolic disease.

Adherents to the infectious theory have considered protozoa, viruses and bacteria as possible causative agents. The protozoan theory, advanced some years ago, has had few proponents and is rarely mentioned in current literature. The evidence favoring the virus theory has been of an indirect nature, not confirmed by many workers. No one has claimed to have isolated the causative virus.

Various theories have been proposed to explain the manner of production of rheumatoid arthritis by bacteria. Some have considered the disease the direct result of bacterial invasion. Others contend that specific bacterial toxins emanating from an infected focus spread to the joints. Still others postulate that bacterial allergens, products of one or more bacterial species, react with hypersensitive tissues and thereby produce the disease. Many micro-organisms have been incriminated. Recently some investigators have held *Streptococcus hemolyticus* alone as responsible, on the basis of indirect bacteriologic evidence. It has been demonstrated that many patients with rheumatoid arthritis possess serum agglutinins to *Streptococcus hemolyticus* in high titer. The same patients may possess serum precipitins to the carbohydrate and protein fractions of the same organism. Further investigation is necessary to determine whether or not *Streptococcus hemolyticus* infection occurs in patients with rheumatoid arthritis, and if so whether it plays any role in the production of the disease. Final conclusions concerning the bacterial theory must be deferred until adequate proof is at hand.

Those who favor the metabolic theory contend that bacteria play either no role or only a minor one. Some type of disturbed alimentation has frequently been considered a cause of the disease. However, regularly occurring physiologic or pathologic alteration of the gastrointestinal tract has not been demonstrated. Although the various metabolic theories are supported by evidence as unconvincing as that for the infectious theories, they will be presented in brief.

A disturbance of protein metabolism has at times been considered of etiologic significance. Lacking factual data, this theory is entirely hypothetical. Current workers believe it had its origin at the time the true nature of gout was recognized.

Alterations in carbohydrate metabolism have been considered by some to be involved in the disease. Although to date the exact relations of these alterations to the disease are unknown, the majority opinion is that they are not causally related to the arthritic process.

A lowered cystine content of the finger nails of some patients with rheumatoid arthritis has been thought by some to indicate the existence of a sulfur deficiency. The abnormality, however, is probably the result of a lowered serum globulin content and not indicative of a disturbed sulfur metabolism. The blood glutathione content and the sulfur metabolism of patients with rheumatoid arthritis have been shown to be normal. Parenteral administration of colloidal sulfur causes increased excretion of sulfur and exerts no beneficial effect on the disease.

The increased calcium and phosphorus excretion observed in some patients with rheumatoid arthritis is no greater than is seen in consequence of disuse. Fasting serum calcium, phosphorus and phosphatase values are always normal. The plasma cholesterol may be lowered. The increased plasma globulin sometimes observed remains unexplained. Rheumatoid arthritis due to food allergy must be rare, because most students of the disease have never observed it.

In a vitamin conscious age, it is not surprising that deficiency of almost every vitamin has been considered the cause of the disease. The demonstrated vitamin C deficiency is not understood. It is not specific for rheumatoid arthritis. The administration of large amounts of ascorbic acid does not alter the course of the disease, although the deficiency may be corrected. The same can be said of vitamin A. Vitamin B deficiency is not specific for rheumatoid arthritis. Despite the claims and exploitations of certain pharmaceutical firms concerning vitamin D, the Council on Pharmacy and Chemistry of the American Medical Association has never accepted such preparations for the treatment of arthritis.

No type of endocrine disturbance has been shown to be causally related to rheumatoid arthritis.

The abnormal peripheral circulation does not alone explain the cause.

The clinical abnormalities which favor the neurogenic theory are probably the result of the disease or caused by the same agent responsible for the articular changes.

Various factors, such as climate, fatigue, emotional strain, trauma or acute infections, may precipitate initial or recurrent attacks of rheumatoid arthritis but they cannot as yet be accepted as the causative agents.

The cause of rheumatoid arthritis being unknown, future workers should continue to search for hitherto undetected metabolic factors as well as organisms.

#### PATHOLOGY

Although rheumatoid arthritis is invariably described as a systemic disease of unknown cause, most writers rarely mention pathologic changes in systems other than the skeletal. This serious omission should be corrected.

Scudamore, as early as 1827, pointed out that rheumatoid arthritis was essentially a disease of dense white fibrous tissue. More recently it has been emphasized that the disease affects primarily the ground substance of the mesenchyme. This ground substance

is a colloidal, jelly-like material existing in the interstices between cells and fibers of mesenchymal origin. With this concept in mind it is not difficult to understand why the lesions of rheumatoid arthritis are widespread.

The articular lesions vary greatly with the extent and severity of the disease. Gross examination early in the disease may reveal severe periarticular swelling and edema, little or no synovitis, and a normally slightly increased amount of synovial fluid. Occasionally the disease may remain confined largely to the periarticular tissues. In such instances considerable impairment of joint function may result from the ensuing fibrosis of the periarticular structures with little or no demonstrable intra-articular change. In most cases intra-articular alterations are present. Early in the disease, excessive proliferation of the synovial cells causes thickening of the synovial lining. It appears edematous and is grayish or pinkish red. The number and size of the synovial villi are greatly increased. In this stage of the disease, the synovial fluid content is increased and the cartilage has usually lost its normal luster and may show superficial ulcerations. As the disease progresses, the changes in the articular cartilage become more obvious. It appears grayish white, softer and may contain larger ulcerations. If the proliferation of the synovial lining tissue continues, it will eventually extend on to the articular cartilage and finally envelop it completely. When the opposing articular cartilages are both enveloped with such inflammatory granulation tissue (pannus), fibrous tissue ankylosis is apt to occur. The advancing pannus not only smooths the underlying cartilage, it actually invades it. Such invasion may be so extensive as to destroy completely the articular cartilage, and bony ankylosis may follow. The proliferating connective tissue seen in the articular chondral marrow spaces is the result of invasion of the pannus penetrating from the articular surface. Gross examination of a severely afflicted joint often reveals adherence of all articular structures in consequence of the pannus formation and the resulting fibrous tissue ankylosis and adhesions. In such cases no articular cartilage may be visible, if seen, its surface is greatly altered. Late in the disease the bony cortex of the adjoining bones is reduced in thickness, the trabeculae are fewer in number and the bone marrow is more vascular.

In the active phase of the disease, microscopic examination discloses inflamed synovial lining. There is pronounced proliferation of the synovial cells, increased vascularity and varying grades of cellular infiltration which may or may not be perivascular. The majority of the cells are lymphocytes. Local collections of lymphocytes, whether perivascular or not, are one of the characteristics of the disease. Fibrosis is not always seen, however. Similar cellular infiltration may be observed in the bone marrow. The microscopic changes, especially in the first stages of the disease, are so ill defined that an absolute diagnosis is impossible.

The subcutaneous nodules of rheumatoid arthritis constitute the one most characteristic pathologic feature of the disease. Although they are similar to those of rheumatic fever, differentiation is usually possible because of predominance of one or more of the pathologic alterations. Exudation of plasma and cellular constituents is a prominent feature of the rheumatic fever nodules. In addition, small focal areas of Aschoff nodules are frequently seen. In the

rheumatoid arthritis proliferation and degeneration predominate, Aschoff-like nodules are rarely if ever seen and exudation is not a prominent feature. The vascular changes seen in such nodules vary from perivascular infiltration of inflammatory cells to diffuse inflammation and degeneration of the entire wall. Thrombosis is observed more commonly in the nodule of rheumatoid arthritis. Similar vascular lesions may occur in the myocardial and renal vessels.

Other visceral changes have been noted. The pleura and the pericardium may be involved. Adherent pericarditis is occasionally encountered. Future studies must determine whether or not there is a specific cardiac lesion in rheumatoid arthritis. Muscle, nerve and fibrous tissue involvement occur frequently.

#### ONSET AND SYMPTOMATOLOGY

*Prodromes*—Many authors refer to prodromal symptoms but, as the onset of the disease is frequently insidious, it is impossible to determine whether these symptoms do not actually constitute a part of the disease itself. In many instances the initial complaints are those of fatigue, exhaustion, lassitude, vasomotor disturbances, numbness and tingling in the extremities, loss of weight and general debility. Since similar symptoms become more pronounced in later stages of the disease, it is probable that the onset has already occurred by the time these symptoms have appeared. In a certain proportion of cases the disease appears to follow an infection, especially an infection of the upper respiratory tract. In other cases such events as emotional stress and strain, severe nervous shocks and various psychic traumas appear to exert a precipitating influence.

The onset of the disease itself may be acute, subacute or insidious. The majority of cases begin insidiously. One or more joints gradually become swollen and painful, and the disease slowly and progressively spreads to involve other articulations. In these cases there may be comparatively little systemic reaction during the early stages. In other instances the onset is more subacute in character. There may be repeated mild attacks of polyarthritis, accompanied by pain, swelling and redness of the affected joints, together with constitutional disturbances such as slight fever, tachycardia and a mild leukocytosis. Finally, in a certain proportion of cases the disease begins as an acute polyarthritis with high fever and leukocytosis. Some of these cases follow an acute infection of the upper respiratory tract and, in their initial stages, simulate rheumatic fever.

*Symptomatology*—In typical cases the articular involvement shows a tendency toward a symmetrical distribution and displays an inclination to proceed from the peripheral joints toward the trunk. The smaller joints of the fingers are particularly prone to be affected, especially the proximal interphalangeal joints of the hands. The involvement of these joints produces the fusiform enlargement of the fingers which is so characteristic a feature of the disease in its early stages. For some reason the terminal interphalangeal joints usually escape. In this respect it usually differs from osteoarthritis. Next in order of frequency come the metacarpal phalangeal joints followed by the wrists, knees, elbows, ankles, shoulders and hips. In severe cases practically every joint in the body may become involved.

*Clinical Features of the Articular Lesions*—A typical rheumatoid joint presents a characteristic appearance

As a rule, swelling, pain and limitation of movement are present but the nature of the swelling is quite distinctive. Owing to the thickening of the periarticular tissues and the atrophy of the muscles above and below, the joint presents a spindle-shaped appearance. On palpation it is evident that the swelling is largely due to thickening and edema of the periarticular structures. The adjacent bursae and tendon sheaths are frequently involved, but there is rarely as much increase in synovial fluid within the joint as might be expected.

While rheumatoid arthritis may become arrested or quiescent at any stage, it usually proceeds to a more chronic condition. The periarticular swelling gradually subsides and contractures begin to develop. The resulting deformities constitute one of the most distressing, disabling and painful afflictions known in any disease. The changes are likely to be particularly apparent in the hands, wrists, knees and elbows, but almost every joint in the body may be involved. In the hands the most common types of deformity are (1) simple flexion of the proximal interphalangeal joints, (2) atrophy of the interossei with thickening of the metacarpal and phalangeal joints and flexion of the terminal joints, (3) simple ulnar deviation at the metacarpal phalangeal joints. In advanced cases fibrous and bony ankylosis may occur, accompanied by subluxation or dislocation of the affected joints. The knee frequently becomes fixed in a position of partial flexion, which is one of the most distressing deformities encountered in arthritis.

*Muscular Weakness and Atrophy*—Muscular weakness and atrophy are prominent in rheumatoid arthritis and in some cases constitute the most striking features of the entire symptomatology of the disease. Atrophy usually is particularly noticeable in the muscles of the hands, but it also occurs in all the muscles of the extremities and contributes to the fusiform appearance of the joints. In the opinion of the majority of observers the muscular atrophy is an integral part of the disease and is not attributable to disuse alone.

*Cutaneous Changes*—The skin of the extremities frequently becomes smooth, glossy and atrophic, and there may be redness of the thenar and hypothenar eminences. The hands are usually cold and clammy but occasionally they are warm and moist—the so-called hot-house palms. In either case the contrast to the drier and coarser skin present in osteoarthritis is usually definite. Changes in pigmentation are occasionally seen including a peculiar bronzing which is particularly distinct over the face and on the extremities. In addition, vitiliginous patches are sometimes observed. Psoriasis occurs in about 3 per cent of cases. This association has long been recognized and has occasioned much speculation.

*Subcutaneous Nodules*—Characteristic subcutaneous nodules occur in 15 to 20 per cent of cases. The nodules are usually found in the region of the elbows and less frequently over other bony prominences. They vary in size from scarcely palpable seedlike particles to lesions the size of an olive. They are not painful except when their position exposes them to undue pressure. Subcutaneous nodules are more frequently observed in severe cases and may persist for years.

*Constitutional Symptoms*—Fever. There is no uniformity to the degree of pyrexia which may occur in rheumatoid arthritis. In many cases the temperature is slightly elevated in the early and more active stages but it may reach no higher than 99 or 99.5 F. In other cases there may be a temperature of 100 to 101 F.

for several weeks or even months with frequent remissions and exacerbations. In still other and more fulminating cases a spiking temperature of 103 to 104 F may be maintained for week after week. Examples of this sort are more frequently seen in the rheumatoid arthritis of children (Still's disease).

**Pulse** A moderate tachycardia is the rule even in cases unattended by fever. Persistent tachycardia is often a striking feature.

**Peripheral Circulation** There is diminished peripheral circulation in this disease. The cold clammy hands, the thin atrophic skin and the cutaneous pigmentation are possibly expressions of this altered physiologic state.

**Blood Picture** The blood picture presents wide variations. A definite degree of anemia is the rule, the average hemoglobin reading being in the neighborhood of 70 per cent with a corresponding diminution in the red cells. In severe but relatively rare cases a more extreme grade of anemia may develop with hemoglobin determinations of 40 to 60 per cent and red cell counts of 2.5 to 3 million.

The white cell count varies considerably in different cases. In the majority of instances it is within normal limits or only slightly elevated. In the acute and active stages, however, counts of 12,000 to 20,000 may be observed, while in long-standing chronic cases a definite leukopenia often develops.

The differential count shows corresponding variations. An increase in the polymorphonuclear leukocytes is the rule in the active stage of more acute cases, and this persists as a shift to the left in the more chronic cases. The platelets are normal.

**General Nutrition** The general nutrition suffers severely in rheumatoid arthritis. Partly because of the disease itself and partly because of secondary consequences, the general state of the bodily functions is greatly impaired. Although muscular atrophy is the most pronounced feature, all the connective tissue structures are affected in greater or less degree. In severe cases profound cachexia may develop.

**Gastrointestinal Disturbances** Various expressions of abnormal gastrointestinal physiology are often seen. They may be secondary to the chronic debilitating nature of the disease. Achlorhydria occurs in about 20 per cent of cases, but this incidence is not significantly greater than in many other diseases in the same age period. Viscerospasm, stasis and atony of the colon are observed in a certain proportion of cases but only rarely do they produce symptoms.

**Visceral Manifestations** Enlargement of Spleen and Lymph Nodes. Splenic enlargement occurs in between 5 and 10 per cent of cases. Usually only the tip of the spleen can be felt, but occasionally the margin may extend half way to the umbilicus. Such a degree of splenomegaly may be associated with a severe secondary anemia, leukopenia and cutaneous pigmentation. These cases are sometimes referred to as "adult Still's disease" or "Felty's syndrome." Enlargement of the lymph nodes is commonly observed. Usually the enlargement is of only moderate degree, but occasionally large firm nodes are present in the axillary and inguinal regions.

**Carditis** Carditis is observed in a proportion of cases of rheumatoid arthritis, but in these instances the presence of a previous or concurrent rheumatic fever must be considered. Pericarditis with effusion is occasionally seen in rheumatoid arthritis in children and adhesive pericarditis in adults.

**Iritis** Iritis, often of an intractable nature, occasionally accompanies rheumatoid arthritis.

**Prognosis** In spite of the vast amount of crippling and deformity to which rheumatoid arthritis leads, the prognosis is by no means as unfavorable as is generally supposed. It is not sufficiently appreciated that a certain proportion of patients recover more or less completely from the effects of the disease. More frequently, however, the process becomes arrested and quiescent at some stage in its course and the patient is able to carry on activities with only a small amount of difficulty. In a smaller proportion of cases the disease pursues a cruel and inexorable course, leaving the patient a helpless and hopeless cripple.

The prognosis depends on a number of factors. At all times it is extremely difficult or even impossible to forecast the turn of events in an individual patient. In the most favorable case a severe relapse may occur at any time, while on the other hand the most malignant example of the disease may suddenly become arrested. In general, those cases in which the onset is slow and insidious and in which fresh joints are involved from time to time present a more unfavorable outlook than those in which the onset is more acute. Unfavorable signs are (1) the development of severe muscular atrophy, cutaneous changes and subcutaneous nodules, (2) the persistence of a high sedimentation rate, (3) the development of constitutional symptoms such as general debility, loss of weight, anemia and tachycardia, (4) depression of spirits and loss of morale.

Few accurate statistics on the natural course of the disease are available, but in general it may be said that fewer than one fourth of the patients "recover," half "improve" or the disease becomes "quiescent," and the remaining one fourth become progressively worse. Prognosis therefore in an individual must be guarded. It is particularly important that these facts should be borne in mind when one is assessing the value of a therapeutic regimen.

#### LABORATORY OBSERVATIONS

**Roentgenologic Observations** — The roentgen pictures vary so much in different stages of the disease that it is convenient to describe the early and late stages separately.

**Early** Early cases may show no roentgen changes but gradually characteristic changes appear. The most uniform of these is a generalized demineralization which affects the skeleton as a whole. As a result of the superimposed factor of disuse, the demineralization usually appears more prominently in the region of the affected articulations, but all the joints in the body participate in the process. Periarthritic soft tissue swelling is the rule, but in later stages it may be replaced by atrophy of soft tissue. Effusion within the joint is a prominent feature. When present it appears roentgenographically dense, sharply defined and fusiform.

**Late** As the disease progresses, destruction of cartilage, with narrowing of the joint space, and small areas of cortical erosion appear. The latter, as areas of atrophic bone destruction, often referred to as "punched out areas," are a prominent feature in rheumatoid arthritis and must be considered in differential diagnosis with gouty arthritis. In the latter, however, the areas are much larger in the latter stages. In advanced cases the articular surfaces may be obliterated through fibrous or bony ankylosis. Not infrequently there may be subluxations or dislocations.

out destruction of the ends of the bones. Coincidentally with these changes there may occur some degree of bone production, lipping and osteophytes. Such changes are, however, of a secondary nature and usually present a different appearance from the corresponding changes in osteoarthritis.

**Sedimentation Rate**—The sedimentation rate of the erythrocytes constitutes one of the most distinctive fea-

TABLE 4—Essential Features of Rheumatoid Arthritis and Osteoarthritis

|  | RHEUMATOID ARTHRITIS   | OSTEOARTHRITIS   |
|--|--|--|
|  | Atrophic arthritis<br>Proliferative arthritis<br>Chronic infectious arthritis  | Hypertrophic arthritis<br>Degenerative arthritis<br>Menopausal arthritis<br>Senile arthritis   |
| CLINICAL DIFFERENTIATION                           |  |  |
| Geographic distribution                            | Most common in temperate climates; rare in the tropics   | Climate not a factor   |
| Family history                                     | Often a history of rheumatic fever or rheumatoid arthritis in an immediate member of family  | Frequently a history of a similar form of arthritis in one or both parents   |
| Past history                                       | Occasionally a history of rheumatic fever frequently of tonsillitis or sinusitis   | Not characteristic; sometimes a history of trauma or faulty body mechanics   |
| Age at onset                                       | Any age over 80 per cent between 20 and 50   | Rare before 40   |
| Mode of onset                                      | Rarely acute usually subacute or insidious often accompanied by migratory pains  | Insidious not accompanied by migratory pains   |
| Patient's general condition                        | Usually undernourished, anemic and chronically ill; frequently slight fever (99+ F) and slight leukocytosis  | Well nourished frequently obese not anemic; no fever, no leukocytosis  |
| Involvement of joints                              | Symmetrical and generalized proximal interphalangeal joints especially involved  | Usually weight bearing joints: spine, hips, knees, distal joints of fingers (Heberden's nodes)   |
| Appearance of joints                               | Early periarticular swelling in uniform fingers; Late ankylosis, extreme deformity, ulnar deviation  | Early slight articular enlargement; Late more pronounced articular enlargement, limitation of motion usually slight, never ankylosis; Heberden's nodes   |
| Muscular atrophy                                   | Often pronounced particularly in later stages  | Not characteristic   |
| Cutaneous changes                                  | (1) Extremities frequently cold and clammy; skin atrophic and glossy; redness of thenar and hypothenar eminences<br>(2) Psoriasis occasionally present | No characteristic features   |
| Subcutaneous nodules                               | Present in 15 to 20 per cent of cases  | Not present  |
| LABORATORY DIFFERENTIATION                         |  |  |
| Agglutination reaction with hemolytic streptococci | Positive in about 50 per cent of typical cases   | Never definitely positive  |
| Sedimentation rate                                 | Usually greatly increased tends to return to normal as patient improves  | Normal or only slightly increased  |
| Roentgenologic appearances                         | Early osteoporosis, periarticular swelling and joint effusion<br>Late narrowing of joint space, bone destruction, ankylosis and deformities            | Early no osteoporosis, slight lipping at joint margins<br>Late marked lipping, osteophytes, narrowing of joint space, deformation of articular bone ends |

tures of rheumatoid arthritis. In the majority of cases it is greatly increased and, although exceptions occur, the increase is usually proportional to the severity and extent of the disease. By the Westergren technic the sedimentation rate in active cases usually varies from 30 to 100 mm in an hour (normal 8 to 10 mm), but values above 100 mm are occasionally encountered. The rate tends to become slower as activity of the disease subsides and in the "burnt-out" stages of the disease normal values are commonly observed. Exacerbations are usually attended by an increase in the rate and

remissions by a decrease. While there are exceptions to these generalizations, the test is sufficiently reliable to yield information of definite clinical value. In particular it is frequently of assistance in distinguishing cases of rheumatoid arthritis from osteoarthritis and "nonarticular rheumatism" in which conditions the sedimentation rate is usually within normal limits. The test also serves as a guide in determining the efficacy of therapeutic measures that may be employed. On the other hand, it should be emphasized that the test is of no value in distinguishing rheumatoid arthritis from a great variety of other conditions, such as rheumatic fever, acute infections and acute gout, in which diseases the sedimentation rate is usually also elevated.

**Immunologic Tests**—A test of considerable theoretical importance in rheumatoid arthritis is the hemolytic streptococcus agglutination test. Unfortunately, however, the test is technically difficult and its usefulness is therefore limited. In about 40 to 50 per cent of cases the serums of rheumatoid arthritis patients agglutinate strains of hemolytic streptococci of Lancefield's group A in a characteristic manner. In order to be significant, agglutination should occur in a titer of 1:160 or higher and should be especially well defined in lower dilutions. With singularly few exceptions this phenomenon is not found in other diseases, and a positive test confirms the diagnosis with reasonable certainty. The test is of particular value in distinguishing rheumatoid arthritis from other forms of arthritis in which positive agglutinations are rarely encountered.

**Antistreptolysin and Antifibrinolysin Titers**—The antistreptolysin and antifibrinolysin titer in rheumatoid arthritis serums are not characteristic. In this respect they differ from rheumatic fever serums, which usually show elevated values.

**Other Laboratory Observations**—Other laboratory tests, such as the basal metabolic rate, gastric analysis, blood calcium, cholesterol and uric acid, do not give characteristic results in rheumatoid arthritis.

#### DIFFERENTIAL DIAGNOSIS

Criteria for diagnosis of rheumatoid arthritis have now been well established, and it is possible to distinguish this disease in most instances from other forms of arthritis. From the clinical picture and the laboratory aids, the typical case offers but little difficulty in diagnosis and only the early or atypical case will cause trouble.

In any doubtful case, aspiration of the joint exudate should not be neglected. Such a procedure carefully made is not attended with danger. The joint exudate in rheumatoid arthritis is sterile, and the finding of pathogenic micro-organisms gives the diagnosis of any specific bacterial arthritis. On the other hand, the physical appearance of the exudate is not typical of any one form of arthritis.

The differentiation between rheumatoid arthritis and osteoarthritis is most important, since numerically these two groups account for approximately two thirds of all cases of chronic arthritis, and there is a great difference in their prognosis and treatment.

The essential features of each of these diseases are arranged in tabular form.

Gonococcal arthritis may be clinically confused with rheumatoid arthritis, especially if more than one joint is involved, and if a recent attack of gonorrheal urethritis is concealed or not recognized by the patient. Both of these diseases present rapid sedimentation rates of the erythrocytes. The diagnosis of gonorrheal

arthritis is confirmed by culture of the gonococci from the joint exudate, a positive gonococcus fixation test or the therapeutic response to sulfonamide derivatives or artificial fever.

Typical rheumatic fever does not present any problem in diagnosis, but there is a chronic type of rheumatic infection very similar to that of rheumatoid arthritis. The patient is usually afebrile. It is important to recognize this form of rheumatic infection, as the prognosis at least as far as the joints are concerned is much better than that of rheumatoid arthritis. The differential diagnosis is made by the laboratory. The blood in rheumatic fever presents significantly high antistreptolysin titers, and the streptococcus agglutination test is negative as a rule.

The clinical picture of acute gout will sometimes be similar to that of atypical rheumatoid arthritis. Usually in such a case the roentgenogram is not conclusive. A high blood uric acid or a therapeutic response to colchicum will serve to substantiate the diagnosis. Also in acute gout the joints return to normal between attacks.

A multiple arthritis can be associated with venereal lymphogranuloma. This occurs more commonly in Negroes and usually is milder than rheumatoid arthritis and responds to rest. The Frei test is specific for venereal lymphogranuloma.

Tuberculous arthritis is usually monoarticular, and after a few months the roentgenogram of the joint shows readily identifiable changes. Injection of the joint exudate into a guinea pig is of value.

Syphilitic arthritis is rare and usually not confused with rheumatoid arthritis. One or only a few joints are involved. A positive Wassermann reaction with response to antisiphilitic treatment settles the diagnosis.

There is a type of arthritis often indistinguishable from rheumatoid arthritis which seems associated with focal infection such as chronic tonsillitis, dental abscesses, sinus infection and the like. Usually one or only a few joints are involved. This is a controversial subject, but a sufficient number of cases are encountered in which there seems to be a relationship between cause and effect, so that the subject cannot be dismissed.

The following four types of arthritis, while called by other names, clearly cannot be separated from rheumatoid arthritis, and until their exact etiology is discovered they will probably be classified by most observers under the general heading of rheumatoid arthritis.

1 Still's disease is a term applied to rheumatoid arthritis of children, as a rule these cases do not give a positive streptococcus agglutination test. The joints have the same appearance as in rheumatoid arthritis. The patient may have the typical subcutaneous nodule.

2 Felty's syndrome has been applied to cases of rheumatoid arthritis in which the liver and spleen are enlarged and leukopenia is present. A high percentage of these patients have positive streptococcus agglutination tests, and they may show the typical subcutaneous nodule. There is no valid reason for a separate grouping of these cases.

3 Psoriasis arthropathica is usually regarded as rheumatoid arthritis presenting psoriatic lesions. Psoriasis occurs in about 3 per cent of cases of rheumatoid arthritis. Here also separate grouping has not been definitely established.

4 Rheumatoid spondylitis (Marie-Strumpell arthritis, von Bechterew arthritis, spondylitis ankylopoietica) is

regarded by many as rheumatoid arthritis of the spine, though the relationship is not clear, and this may be a separate entity. The sex incidence is ten or more males to one female, which is in sharp contrast to the more common type of rheumatoid arthritis.

#### TREATMENT OF RHEUMATOID ARTHRITIS

Although at the present time there is no specific cure, it seems possible to control the disease and to change its clinical picture much as one controls a severe case of tuberculosis. Certain factors must be borne in mind in evaluating results of therapy.

1 Rheumatoid arthritis is a systemic disease, the patient must be treated as a whole, rather than have local treatment of his joints alone.

2 The disease is subject to spontaneous relapses and remissions.

3 Certain patients recover fairly quickly, and the last therapy used is often given the credit.

Realizing the difficulty of evaluating therapeutic claims, one should not be too dogmatic in stressing the value of any single measure. In general, however, therapeutic agents may be divided into three groups.

1 Those which rest on sound principles and are of proved value.

2 Those about which optimistic reports have been published but the value of which is still unsettled.

3 Those which are of questionable value or useless.

The first group consists of measures directed toward improving the patient's general health.

1 *Measures of Proved Value*—(a) rest—general, local, (b) general nutrition—cod liver oil, (c) transfusions—iron, (d) removal of infections, (e) drugs—salicylates, barbiturates, (f) sunshine in an equatorial climate, (g) prevention and correction of deformities, (h) physical therapy and occupational therapy, (i) psychotherapy.

(a) Rest. Rest is the most important measure in the treatment of this disease—rest for the body as a whole and rest for the inflamed joints in particular. But, in prescribing rest, intelligence and insight are necessary. Many patients state that all they do is rest. Examination of such patients, however, will frequently show that they are tense and that their muscles are in more or less constant spasm. Many of them have only fitful hours of sleep; they are completely exhausted physically and mentally. The amount of rest varies from complete confinement to bed with hospitalization from six weeks to one year for the severe to bed rest for the day with a two hour rest period for the mild. Each case must be considered on its own merits. Local rest, suitable splints are of great assistance.

(b) Nutrition. The majority of patients are underweight, undernourished and chronically ill. Every effort should therefore be made to maintain their nutrition in the best possible state. A well balanced and nourishing food is essential. In addition, liberal quantities of cod liver oil may be given.

(c) Transfusions. Hypochromic (secondary) anemia is common in this disease, and two or three transfusions of 400 cc at regular intervals may be of distinct benefit.

(d) Removal of Infections. The patient with rheumatoid arthritis has as much right to the removal of abscessed teeth, diseased tonsils, or other infection as any other person under the care of a physician. The treatment of such infection is for the general health. Wholesale extraction of

tonsils or gallbladders and sinus operations should be discouraged. On the other hand, recent articles decrying the removal of foci of infections are apt to swing the pendulum too far in the other direction. A careful and conservative attitude is indicated.

(c) *Drugs* Salicylates constitute the one group of drugs which are of symptomatic value. Iron in available form also may be administered. Occasionally it is necessary to resort to other drugs, such as barbiturates for rest and sleep.

(f) *Climate* Two facts seem to be well established with regard to climate: (1) the disease rarely occurs in the tropics and (2) the incidence diminishes as one goes south. Once the disease is established, the effect of climate is not so clearcut, no satisfactorily controlled experiments having been made. Almost all one can definitely say is that other factors being equal, it seems wise for rheumatoid patients to avoid the northern winters when possible.

(g) *Prevention and Correction of Deformities* In no disorder of the joints is the prevention of deformities of greater moment. The deformities are too often due to neglect and, to a great extent, can be obviated. The advantages of correct posture, suitable splints and intelligent exercises can be fully learned only by experience in an arthritis clinic, or from the orthopedist. If ankylosis occurs, it is of the utmost importance that the affected joint become ankylosed in the optimal position for use. There is an enormous difference in function between a stiff knee flexed more than 20 degrees and one more nearly straight, between a hip joint and thigh fixed in more than 5 degrees of abduction, 10 degrees of adduction or 10 degrees of flexion and a hip in a nearly straight position, between a wrist and hand in plantar flexion and pronation and one in middorsal flexion half way between pronation and supination, between an elbow ankylosed in extension and one flexed at slightly more or less (depending on occupation) than a right angle, between an arm glued to the side of the body because the scapulo-humeral articulation has been arthrodosed by the disease in this position and an arm abducted from 50 to 70 degrees which can move up or down with the scapula. In rheumatoid spondylitis, a suitable brace may prevent the spine from becoming rigid in a faulty position. The flexion deformities of the hands can usually be prevented by a simple splint which is worn for part of each day. In general, when stiffness and pain are severe, weight bearing should be restricted. When weight bearing is allowed, suitable shoes should be prescribed and worn consistently.

When deformities due to ankylosis have occurred, surgical measures may be of great value. Synovectomies may be useful. Such surgical procedures should be done only by the skilled orthopedist and usually when the activity of the disease has subsided.

(h) *Physical Therapy* Physical therapy and spa therapy are useful for many types of arthritis. Baths and exercises in warm pools are sometimes helpful. Heat in the form of poultices, melted paraffin baths, baking lamp or diathermy is often comforting but is not curative. In fact, in the acute case local heat sometimes is not well tolerated. The most useful forms are generally stimulating treatments, as cabinet baths, massage and muscle exercises.

(i) *Psychotherapy* The importance of psychic factors in this disease is great but has not been clearly defined. It is clear, however, that the attitude of the

physician to the patient is most important. Encouragement to the patient and an optimistic interest in his illness will often help him to carry out his routine, whereas the reverse attitude will permit the patient simply to sit and develop deformities.

*2 Measures Which Have Had Optimistic Reports But of Which the Value is Still Undetermined* (a) chrysotherapy, (b) vaccine therapy (nonspecific), (c) foreign protein therapy.

(a) *Chrysotherapy* The use of gold salts has recently attained considerable vogue, more particularly in France and England. At the present time they are being given wide therapeutic trial in the United States. So many favorable reports have appeared that one cannot deny their beneficial effect. Most authors claim improvement in from 48 to 80 per cent of cases. Of these perhaps 10 per cent can be regarded as cures. Many preparations of gold have been used. Some of these are used intramuscularly and some intravenously. It is now recognized that the salts of gold, like those of most of the other heavy metals, are not without danger. Unfortunately the danger from the administration of gold salts has been considerable. Several deaths and other serious complications have been encountered, even in the hands of those most skilled in the use of gold salts. The incidence of important toxic reactions is about 17 per cent. The most frequent complication is dermatitis which varies from pruritus and simple erythema to a severe exfoliative dermatitis. Fever, stomatitis, neuritis, diarrhea, vertigo, albuminuria, purpura hemorrhagica, granulocytopenia and aplastic anemia have been reported. The drug is usually given at weekly intervals in courses of ten injections, and the patient should be examined carefully before each injection for evidence of toxicity. The results, as far as cures are concerned, are far from miraculous, but in view of the large number greatly relieved a continuance of trial of this form of treatment under controlled conditions is both desirable and justifiable.

(b) *Vaccine Therapy* The value of vaccine therapy remains unproved. The results reported vary widely. Probably the greatest value of this therapy lies in the weekly observation of the patient or in its psychologic effect. The vaccines most commonly used are autogenous vaccines, vaccines made of the common organisms of the upper respiratory tract or mixed hemolytic streptococcus vaccines.

(c) *Foreign Protein Therapy* The value of foreign protein injections in the form of milk, typhoid vaccine and the like has not been definitely proved. Some observers are convinced that they are of definite value.

*3 Measures Which Are of Questionable Value or Useless*—(a) vitamins in massive doses, (b) drugs as specifics, (c) endocrine preparations, (d) dietary fads, (e) fever therapy, (f) sulfur, (g) vaccines as a specific curative procedure, (h) bee venom therapy, (i) sulfonamide derivatives.

At the present time therapy with large doses of vitamin D should be regarded as of doubtful, if any, value. There are no specific drugs. Beneficial reports with endocrine preparations, dietary fads and colloidal sulfur have not been substantiated. Good results from fever therapy are likely to be only temporary. Bee venom injections probably have an effect similar to foreign protein, at least the most recent experiments indicate that such injections are of no value. While it was hoped that sulfonamide derivatives might give a new approach, so far results have been disappointing.

OSTEOARTHRITIS (HYPERTROPHIC,  
DEGENERATIVE)

## ETIOLOGY

*Primary osteoarthritis* is essentially a disease of late adult life and is especially prone to occur in weight bearing joints and in joints in which a considerable amount of motion takes place. It is also prone to occur in the short, heavy, so-called herbivorous type of individual. Observation on postmortem material by various investigators has shown that before the age of 40 degenerative changes are relatively slight but that after the age of 40 they are increasingly common. As a result of these and similar observations on animals there is at present a rather widespread belief that the changes which comprise the pathologic picture of the disease are the result of the normal wear and tear of everyday use and that it is a natural phenomenon for the joints of man and of other animals to develop these changes as age advances.

However, there are certain characteristics of the disease which are not explained by this theory. One of these is the fact that occasionally the disease is well developed in patients who are relatively young—that is, in their middle thirties—while other people reach relatively advanced age and yet their joints show only slight osteoarthritic changes on clinical and roentgenographic examination. It is thus evident that, if the disease is due to wear and tear and nothing else, certain persons must be born with an articular joint structure which is definitely subnormal. In support of this theory

the disease at times tends to be relatively frequent in families and it may be so frequent that a definite hereditary tendency is suggested. Also against the pure wear and tear theory is the fact that one of the most frequent sites of the development of the disease is the terminal interphalangeal joint of the fingers, that is, the so-called Heberden's node. Not only is this a frequent site in which the disease cannot be explained by excessive use, but these Heberden's nodes frequently develop on the fingers of those who have done practically no manual work.

Removal of foci of infection has no influence on uncomplicated degenerative joint disease. Furthermore, the pathologic changes incident to this condition are not similar to those present in various forms of infection of joints. Consequently, the infectious theory has been almost entirely abandoned. Another theory is that of intoxication, it being believed that certain toxins were absorbed either through the gastrointestinal tract or possibly from foci of infection and that these toxins exerted a malign influence on the articular structures and caused the degeneration which resulted in the arthritic changes. This theory has been abandoned by most observers because of lack of any evidence to support it. It is now generally believed that arteriosclerosis is not the cause of the arthritic changes but is merely incidental because the disease tends to develop in people who are in the arteriosclerotic age.

Many still believe that there are other causes which tend to precipitate and to accelerate the progress of the disease. Since the primary change is degeneration of the articular cartilage, it is believed that in some way the nutrition of the cartilage is interfered with and that diet and endocrine factors may be responsible. It is probable that, with advancing years, persons of a stocky type tend to develop the disease more frequently than the tall, slender, so-called carnivorous type of persons.

No adequate explanation has been offered of the fact that a person may have advanced pathologic changes in various joints over a period of years and have no clinical symptoms, and then suddenly and apparently without warning and without any undue injury to the joint the clinical disease may develop in a particular joint and may persist with pain, swelling and disability over a considerable period of time.

*Secondary osteoarthritis* differs from the primary disease in that it affects single joints or occasionally joints on both sides which have been subjected to similar insults. It results from gross skeletal deformity, fractures and ligamentous injuries which produce abnormal strain or incongruity of the joint surfaces, and from long continued successive trauma to a given joint. The development of the hypertrophic changes is dependent on the continued use of the injured joint.

## PATHOLOGY

The disease affects primarily the weight bearing joints, and the first pathologic change is a softening of the articular cartilage. On gross appearance the involved area has lost its bluish white, shiny translucent appearance, has become dull, and its surface is finely granular in appearance. Should pressure be made on such an area it will be found that this involved portion is softer than is the normal articular cartilage. It is to be noted that these primary areas of degeneration tend to occur in the central portions of the weight bearing joints—that is, far from the articular margins where it is believed that the nutrition is better because of the periarticular plexus of vessels—and also at the point where the articular surface receives the maximum amount of pressure.

Microscopically this soft area of cartilage is beginning to disintegrate. The surface tends to peel off in small flakes and the deeper layers of the cartilage tend to be fibrillated, being split into columns. It is believed that this peeling off and fibrillation of the articular cartilage is due to the lack of or deterioration in the quality of the cement substance which binds together the fibrous bundles which make up the cartilage matrix. When the surface of the cartilage flakes off and when the deeper layers become fibrillated so that the surface resembles the pile of velvet, many of the cartilage cells become necrotic.

In addition to necrosis of the cells which border the clefts in the cartilage and which border the surface, there is a tendency to proliferation of cells in the vicinity if the lacunae are still intact and there results an irregularity in the cellular structure, the dead cells disappear while neighboring living cells proliferate and form cell nests. As a result of the continued function of the joint with pressure and friction on the articular surface, the disintegrating cartilage is gradually worn away.

The change in the underlying subchondral bone consists of a proliferation of the bone-forming elements, so that the haversian canals are narrowed and the trabeculae are thickened and the subcortical bone becomes more dense, invading the cartilage to a variable degree. Hence when the cartilage disappears the joint surface is composed of dense eburnated bone.

Concomitant with the changes in the surface of the articular cartilage and the subchondral bone there occur changes around the margins of the joint. These changes are proliferative in character, both of the cartilage and of the subchondral and subperiosteal bone.

New bone is formed and tends to invade the cartilage over it or to form excrescences around the margins of the cartilage. At the same time there is a tendency to proliferation of the cartilage cells so that cell nests are formed, and there is probably a variable amount of metaplasia into cartilage of the adjacent connective tissues where the synovial and periosteal tissues merge gradually into the articular cartilage.

As a result new tissue is formed the surface of which is cartilage and the base and interior of which are cancellous bone. These are the so-called osteophytes, or marginalipping or hypertrophy, which give to the joints their characteristic roentgen appearance. There also may occur irregularities on the articular surface due to ecchondroses, or thickening of the articular cartilage, which in turn are supported by thickening of the subchondral bone. The interarticular fibrocartilages, such as the semilunar cartilages, and the interarticular ligaments, such as the cruciate ligaments and certain tendons which are in intimate relation to the joints, also show degenerative changes with lack of cement substance, fibrillation of their structures and necrosis of their cells to a variable degree.

In some instances the synovial membrane becomes thickened and hypertrophied and may exhibit rather extensive villus formation and a considerable increase in vascularity. However, the proliferation of the synovial surface cells and the infiltration of subsynovial areas which are characteristic of rheumatoid arthritis and of arthritides which are due to specific infections of various types do not occur. In certain instances cartilage may be laid down in the synovial membrane. In others there is a fibrosis of parts of this structure and there may be considerable arteriosclerosis of the vessels in the deeper layers of the synovial surface. As a rule, the synovial fluid is normal in amount and in cellular content. However, this fluid may be increased in amount and contains slightly more cells than normal.

Since the exposed area of the subchondral bone is dead and contains no living cells and since there is no formation of granulation tissue, ankylosis between the opposing articular surfaces does not occur except rarely in the spine. However, limitation of motion in joints may occur as a result of the encroachment of formations of new bone around the margins of the articular surfaces. This is particularly true in the hip and spine and also in the ankle and fingers.

At the present time little is known as to the cause of the pain in osteoarthritic joints. Not only is the pain present in the articulations, but not infrequently the pain is present around the joint and may extend for considerable distances along the bone. This is especially true of the knee and it is not infrequent for the pain and tenderness to extend down along the inner aspect of the tibia for a considerable distance below the attachment of the ligaments of the knee joint. It is to be noted that, in people with osteoarthritis, laboratory examinations of blood and urine reveal nothing abnormal. The sedimentation rate of the erythrocytes is not usually increased, the blood picture and the blood chemistry are normal, except that in certain persons the cholesterol content is elevated. In elderly patients arteriosclerosis is common.

A not rare and quite crippling type of arthritis is that of the hip known as *malum coxae senilis*. This is really a severe type of osteoarthritis in which the head of the femur tends to become deformed while new bone is produced around the acetabulum with the result that the head no longer fits the socket, and not

only is the patient handicapped by limitation of movement in the hip but the joint is painful after use. The changes in the joint of *malum coxae senilis* are like those of osteoarthritis, except that these changes not infrequently occur in persons in whom the other joints are essentially normal. They may occur at a relatively early age and in many instances they are due to incongruities of the joint or the result of either congenital anomalies or of injury or of disease in childhood especially Legg-Calve-Perthes disease, or of slipping of the femoral epiphysis or deepening of the acetabulum.

#### CLINICAL FEATURES

**Onset**—Osteoarthritis may exist entirely without symptoms. As a rule, its onset is gradual and insidious and its course chronic. It is estimated that 97 per cent of the people who live beyond middle life develop characteristic joint changes with or without symptoms. In many, perhaps, most patients, there seem to be few gross physiologic disturbances.

**Symptoms**—The early symptoms vary. Locally stiffness of one or more joints may be noticed, especially after rest, with improvement on moderate use during the day, but worse again the next morning, discomfort, even pain, in joints, produced by overuse or trauma and relieved by rest, fixation and heat, numb sensations in the fingers, especially the little fingers and hypersensitivity of the joints to any blow. Easy fatigability on exertion may be one of the general complaints.

Common early signs are slight enlargement of the joints of the fingers, knees and toes. These overgrowths on the margin of the joints, when they occur in terminal phalanges of the fingers, are called Heberden's nodes.

As time goes on, the disalignment of the joints results from the irregular degeneration and loss of cartilage. This is especially noticeable in the fingers, knees, hips and toes (*hallux valgus*).

Sometimes soft tissue swelling develops, because the chondro-osseous ridges cause joint irritation when used. There is rarely any joint effusion.

**Natural History**—The natural history or clinical course of the disease depends on heredity, age, diet, obesity, circulatory disturbances, occupational strain and trauma, accidental injury and probably faulty body mechanics—all factors that basically underlie the disease and cause the remissions and exacerbations. As time goes on without treatment, more joints are involved. Great disability and pain may result if the spine, hips and knees are injured. Ankylosis does not occur except in the spine, where exostoses may fuse with one another. Motion decreases as these enlarging painful bone growths impinge.

**Late Symptoms**—The changes in the spine may cause irritation and pressure on nerve roots in all parts of the spine (occipital, cervical, brachial, intercostal, inguinal, anterior crural, sciatic). The nerves may be painful but are not usually sensitive to touch, as in neuritis.

**Roentgenologic Appearance**—Early in the disease little may be seen in the roentgenograms except sharpening of the margins of the joints. The hands usually show these minute changes first and are good guides to the nature of the disease process. The toes, knees and cervical bodies may show early spurring. As the disease progresses, the degenerative process in the articular cartilage increases and the chondro-osseous overgrowth at the joint margins shows more clearly. The joint space is narrowed by the degeneration of the

articular cartilage. The articular ends of the bone become deformed by the loss of cartilage, and the joint lines are changed by the overgrowths of bone masses. Flattening or mushrooming of the ends of the bones takes place. In the spine, "beaks" grow from the margins of the bodies and may impinge or unite. In the knees these exostoses may break off and form calcified loose bodies in the joint cavity. Sometimes cystlike cavities in the cancellous bone ends appear near the thin ebonized surface. Roentgenograms should always be taken of the hands even if they are symptomless, because they reveal early changes and are easy to interpret.

*Laboratory Observations*—There are no characteristic abnormalities which can be determined by laboratory methods.

The blood is usually normal. Anemia is unusual. The sedimentation rate is normal except in the mixed types of arthritis. Agglutinins for hemolytic streptococci are absent in contradistinction to rheumatoid arthritis.

The metabolic rate is often lowered. The dextrose tolerance curve is not infrequently diabetic in type, as in rheumatoid arthritis.

*Differential Diagnosis*—The diagnosis of osteoarthritis in its early stages is not difficult and is of great importance. The points of significance to remember are

1 Even without important symptoms the history of a similar type of arthritis in the parents

2 The age after 40 at about the time of the menopause in women

3 The frequent history of trauma and the presence of faulty body mechanics

4 The insidious onset of stiffness and vague joint pains

5 The well-being of the patient without increased sedimentation rate, anemia, fever or other illness

6 The involvement of weight bearing joints and the presence of typical Heberden's nodes

7 The minute characteristic chondro-osseous growths seen in the roentgenograms

Later the loss of motions, irregular deformities and actual marginal exostosis leave no doubt as to the nature of the type of arthritis with which one is dealing.

The differential diagnosis is sometimes complicated by evidences of mixed rheumatoid arthritis and osteoarthritis in the same person. The soft tissue swelling in cases of rheumatoid arthritis may obscure the Heberden's nodes and bony exostoses which are seen in the roentgenogram. Differential diagnosis must be made between osteoarthritis, gout and other pathologic conditions of the bones and joints, such as osteitis deformans (Paget's disease), Charcot's joints, osteitis fibrosa, neoplasms and chronic osteomyelitis (Brodie's abscess). Osteoarthritis may of course be found in conjunction with all these. Osteoarthritis in such cases may be considered nature's attempt to repair damage to the margins of the joints.

*Principles of Treatment*—Treatment must be divided into general and local types. Osteoarthritis is a constitutional disease. From the constitutional angle but little can be done to change the hereditary tendency except by anticipation. Environmental factors are, however, susceptible to change, such as habits of living, type of exercise and work, overexertion, bad habits of posture, dietary faults and fatigue. Faulty postural habits are important in causing trauma of the weight bearing joints.

Treatment includes

(a) The correction of body mechanics (posture) by proper rest positions, by corrective exercises for the body and by orthopedic braces and supports.

(b) The maintenance of good circulation. The blood supply of the joints must be increased by all possible means if the permanent joint tissue changes are to be minimized. Rest and freedom from worry are important.

(c) Dietetic errors, overexertion and gastrointestinal dysfunction all require steady care.

Vitamin deficiencies must be controlled and the patient restored to the highest state of well-being of which he is capable. The principle in treatment beyond this is the removal of exciting causes to prevent the progress of the disease and the relief of pain and limitation of motion in the joints.

Overfatigue must be avoided. A conservative attitude should be taken toward the removal of foci of debatable significance.

Glandular therapy may have a place in the treatment as sometimes a low metabolism is found and the judicious use of thyroid may be indicated. Its use, however, should be carefully controlled.

The diet should be well balanced, containing adequate though not excessive calories in order that the patient may not gain weight, as weight adds to the traumatic strain on the joints. Consequently concentrated starches and sweets as a rule should be decreased and the diet should be adequately balanced. There is no specific diet for osteoarthritis.

Vaccines seem to have no place in the treatment of osteoarthritis.

Pain may be controlled by the use of acetylsalicylic acid or other salicylates.

The local treatment of joints is aimed to reduce pain. Heat and massage with moderate voluntary exercise are useful in improving the local blood supply. One should, however, avoid massage of the tender osteoid tissue covering bony growths at the margins of the joints, as it is apt to cause more irritation and so increase their size and sensitiveness. Voluntary exercise is much better than passive exercise for this reason though passive exercise may decrease the stiffness. Excessive exercise increases the stiffness. Local counterirritants may be used to relieve pain and cause hyperemia, such as analgesic balm and oil of wintergreen. Roentgen treatments have been used with reported relief of the pain in some joints, particularly the knees or the hips. They do not, however, change the bony exostosis but through the relief of pain may increase the range of motion if the chondro-osseous edges are no longer sensitive.

Osteoarthritic joints require protection. Rest is essential, and, since this is a nonankylosing type of arthritis, complete rest in casts may be given without danger of permanent stiffness. Usually the joints are more limber after rest in bed or after the removal of plaster splints than before the rest was given. The hip may become flexed and abducted, the shoulders may lose their excursion in abduction and the spine may become bowed, but, in general, the deformation of joints that occurs in osteoarthritis is due to the changes in the articular bone ends or of the sockets of the hips and the shoulders. Correction of deformities requires orthopedic appliances such as foot supports, which make walking more comfortable, laced elastic knee braces, knee braces to relieve painful knees, and belts to

special corsets and back braces with abdominal supports, which often relieve backache and sciatic pain.

Surgery may play a small part in the region of the knees and hips. The removal of loose bodies (joint mice) is usually confined to the knees and may give relief from pain and instability, particularly when they have been caught between the joint surfaces.

Operations on the hip, such as the removal of the superior ridge of the acetabulum and the vitallium cap for the hip, have been used in order to relieve the pain. Arthroplastic operations are not particularly indicated except in involvement of the hip in which limited motion and adduction cause pain and deformity as in "morbus coxae senilis." The surgical removal of bony overgrowth is to be discouraged, for its relief is only temporary. Forcible manipulations are contraindicated, for, although greater freedom of motion and relief of pain may be gained for a few weeks, larger overgrowth and disability eventually result.

**Prognosis**—The prognosis for the relief of symptoms of the joints and the control of the generalized disease is good. It is not inevitably a progressive disease. The hyaline articular cartilage, once destroyed, does not regenerate completely. Long-standing bony or calcareous deposits about the joints cannot be made to disappear, though their sensitive osteoid caps may shrink in size and become almost painless. However, there remains the permanent handicap of more or less imperfect joints, but imperfect joints may be made less painful by treatment. It is often surprising as the disease is controlled and support afforded to observe how slight is the handicap imposed by the joints in which roentgen examination reveals such extensive changes as to suggest disturbance of function and almost complete disability. An arrested generalized disease protective appliances and disciplined observance of instructions make possible a life that is often entirely satisfactory to the patient.

### GONOCOCCIC ARTHRITIS

Gonococcic arthritis is a common type of specific infectious arthritis. Until the advent of artificial hyperthermia and the sulfonamides, gonococcic arthritis crippled at least one fourth of its victims. Such crippling can be prevented if the disease is recognized early and treated adequately.

#### INCIDENCE

The articular complications of gonorrhea occur most frequently during the third decade, the period when gonorrhea is at its peak, however, no age group is exempt. Approximately 2 per cent of those with gonorrhea have arthritis, men being afflicted twice as frequently as women. This higher sex incidence is due in part to the anatomic differences of the genito-urinary tracts and the higher incidence of gonorrhea in males.

#### ETIOLOGY

The responsible etiologic agent for this type of arthritis is the gonococcus. It is frequently isolated from the primary focus, less commonly from the articular structures (25 per cent of the cases) and least of all from the blood stream. In most patients the arthritis begins two to four weeks after the appearance of the initial infection, therefore one is usually able to isolate gonococci from the original focus. In adults the primary focus is generally found in the genito-urinary tract, in children in the conjunctivas and the vaginal and rectal mucous membranes. From these sites the infection spreads by way of the lymphatics and venous channels

into the blood stream. A bacteremia results and, if the organisms are not killed by phagocytosis or the natural occurring bactericidal antibodies of the blood, they may localize in various tissues, showing the most evident affinity for the mucin-containing structures such as the joints, tendon sheaths, bursae and eyes.

#### PATHOLOGY

The acute phase of the disease is characterized by a diffuse hyperemia, edema and infiltration of the synovial tissues with inflammatory cells, predominantly polymorphonuclear leukocytes. In the severe forms the synovial fluid becomes infected and septic, the synovial lining tissue proliferates and may extend on to the margins of the articular cartilage, the surface of which may show areas of destruction in consequence of enzymatic action. With subsidence of the infection, complete resolution may take place or scar tissue may replace the granulation tissue. In the mild and sub-acute types the inflammatory reaction is less severe, the joint fluid is rarely infected, and the articular cartilage escapes destruction. These pathologic changes are similar to those seen in any type of pyogenic arthritis excepting that due to the tubercle bacillus. At present there is no evidence to support the hypothesis that gonococcic infections are ever responsible for a chronic, progressive type of arthritis such as rheumatoid arthritis.

#### SYMPTOMATOLOGY

The acute onset is frequently preceded by a chill or chilly sensations. Acute genitourinary trauma caused by instrumentation, prostatic massage, sexual overactivity, pregnancy and injudicious self treatment may be the cause of the initial invasion of the blood stream. During and following the bacteremic phase there is a moderate intermittent fever, the temperature rarely going above 102 F. Metastatic phenomena such as iritis and petechiae may be observed. The arthritis is at first polyarticular and migratory in nature. This phase lasts from three to seven days. The infection finally localizes in one or more of the large joints. No joint is exempt, although the knee, ankle, shoulder, wrist and hip, in the order named, are most commonly involved. Ligamentous and tendinous involvement is frequent. The tendons about the wrists and ankles and the ligamentous attachments of the os calcis and patella are most commonly involved. In many patients acute and chronic joint trauma favor the final localization of the organisms. The resulting pain, swelling, redness and heat are often more intense than the febrile reaction and leukocyte count would indicate.

#### ASSOCIATED FEATURES

Conjunctivitis may be encountered in gonococcic arthritis and has been reported as being present in from 10 to 20 per cent of the cases. Iridocyclitis, a serious complication in that permanent impairment of vision may result, is observed. Keratoderma blennorrhagica, acute hemorrhagic glomerulonephritis, pyelonephritis and pyelitis are rare complications. Gonococcic endocarditis and meningitis, other rare complications, were almost always fatal before the advent of chemotherapy.

#### LABORATORY OBSERVATIONS

**Blood**—Leukocyte counts varying from 8,000 to 30,000 are observed, they are usually between 10,000 and 15,000. Except for a moderate degree of secondary anemia in the severer infections, the red blood cells and hemoglobin show no changes.

**Bacteriology**—Recent experience reveals that cultures are superior to smears, especially in subacute and chronic infections, both, however, should be made from material obtained from the primary focus and the synovial fluid. The most satisfactory medium is blood ascitic fluid agar incubated at 36 C in an atmosphere of 20 per cent carbon dioxide.

**Serologic Tests**—A positive gonococcus complement fixation reaction is presumptive evidence that the arthritis is due to the gonococcus and may be the first intimation of the true nature of the disease. Although the first test may be negative, repeated tests show positive results in 90 to 98 per cent of patients with gonococcic arthritis.

**Sedimentation Rate**—During the active stage of arthritis the sedimentation rate of erythrocytes is considerably increased but frequently returns to normal within three to six weeks after the institution of adequate treatment with sulfonamides.

**Synovial Fluid**—A pronounced reduction of the fasting synovial fluid sugar content suggests that the fluid contains organisms. Leukocyte counts, done with a blood leukocyte pipet with isotonic solution of sodium chloride as the diluent, are under 30,000 in sterile fluids but in fluids with positive cultures are usually above 30,000 with 90 per cent or more polymorphonuclear leukocytes.

**Roentgenologic Examination**—Soft tissue swelling and joint widening are the only abnormalities observed during the first eighteen days of the disease. Following this, bone atrophy becomes apparent in the roentgenograms of the moderately and severely involved joints. Bone destruction may occur in the severe untreated cases. Periostitis adjacent to infected joints is seen in approximately one fourth of the cases. Except for the rapidity and extensiveness of the bone destruction, there is little to distinguish gonococcic arthritis from other forms of septic arthritis.

#### DIFFERENTIAL DIAGNOSIS

Only when the cultures of the synovial fluid, genital tract and blood are negative as well as the complement fixation tests is the diagnosis difficult. It may be necessary to differentiate it from rheumatic fever, atypical rheumatoid arthritis, gout, tuberculous joint disease and other forms of specific infectious arthritis. Careful evaluation of the history, a detailed physical examination, the results of therapeutic trials with salicylates, the presence or absence of electrocardiographic changes, uric acid determination of the serum, careful bacteriologic studies, animal inoculation when indicated and the clinical course of the disease will enable one to make the correct diagnosis in most instances.

#### COURSE AND PROGNOSIS

The duration and severity of the arthritis depend on the virulence of the particular strain of gonococcus and the resistance of the host. If the infection localizes in the periarticular structures and the synovial fluid remains sterile, complete recovery without residual joint change is highly probable. If specific therapy is not administered early to patients who have infected synovial fluids, permanent joint destruction, with or without ankylosis, will occur in a high percentage. Specific therapy should be instituted as soon as the diagnosis is made because bone destruction may appear within three weeks, and once this has appeared permanent joint damage cannot be prevented.

#### TREATMENT

Specific therapy is of two types: fever treatment and sulfonamide compounds. Sulfonamide derivatives require less apparatus and are less dangerous for general use and are much less expensive than is fever therapy. The only contraindication to their use is a hypersensitivity to the drugs. Proper administration of one of these drugs will sterilize an infected synovial fluid within twenty-four to seventy-two hours. The highest percentage of cures is obtained when these drugs are given in adequate amounts. This can be achieved readily if the drug is administered every four hours day and night and the fluid intake kept constant (approximately 2,000 cc per twenty-four hour period). Adequate blood levels must be maintained for the particular derivative employed. In most cases striking improvement is noted within twenty-four to seventy-two hours. Further study is necessary to determine which of these sulfonamide compounds is most effective. If chemotherapy does not bring about a cure, fever therapy alone or in conjunction with one of the sulfonamide derivatives can be employed.

#### GOUT AND GOUTY ARTHRITIS

Gout is a disease of unknown etiology characterized by (1) an arthritis which is at first acute and recurrent but which later may become chronic, (2) a supposed abnormality in purine metabolism evidenced by the abnormal disposition of uric acid, (3) hyperuricemia, which is often transient at first but later generally becomes chronic, (4) eventual deposition of sodium urate crystals in articular, periarticular and subcutaneous tissues, sometimes also in the kidneys and urinary tract, and (5) frequent terminal vascular lesions in the kidneys, less often in the heart and brain.

More than 90 per cent of gouty patients are men, they are usually more than 30 years of age. Many, but by no means all, gouty patients are of more than average weight, many do ingest excessively meats and alcoholic drinks, but gout may affect vegetarians and teetotalers. Although excessive intake of purines and alcohol may provoke attacks of gouty arthritis in those who already possess the fundamental (unknown) cause of the disease, purines and alcohol are no more the cause of the underlying gout than are sugars and carbohydrates the cause of diabetes.

#### DESCRIPTION OF AN ACUTE ATTACK OF GOUTY ARTHRITIS

Most patients do not notice prodromes to an acute attack, others notice nausea, indigestion or dyspepsia, melancholia, nocturia or polyuria, irritability or vague muscular symptoms, others experience euphoria or a ravenous appetite. The first articular symptoms may occur at any hour. Sometimes the patient may be awakened with pain in the early hours of the morning (2 to 4 o'clock), but more often pain is first noted on awakening in the morning the patient first notices his foot or other affected joint. Within a few hours the affected joint or joints usually become red or dusky, swollen and exquisitely tender to touch. Jarring of the bed may provoke an intense paroxysm of pain. Walking or bearing is impossible in the more severe attacks. The pain is often worse at night. Moderate fever may or may not be present. In early attacks usually only one joint is affected, in about 50 per cent of cases the first tarsophalangeal (bunion) joint of a great toe is affected initially, but other toes or regions of the foot or hands, knees, hands, wrists or elbows are commonly affected.

joints of the spine hips and shoulders are rarely involved. If the attack is untreated or not treated as gout it may last several days or weeks but if properly treated it may subside rapidly. Swelling and discoloration subside, pain tenderness and stiffness disappear and the joint becomes normal.

#### DIAGNOSIS OF GOUT AND GOUTY ARTHRITIS

*Characteristic Pattern of Gouty Arthritis*—In contrast to most other forms of arthritis, articular function is recovered completely between attacks. As time goes on, the severity and frequency of the attacks of acute arthritis often increase, in some cases late in the disease the arthritis becomes chronic.

*Provocatives*—Attacks are often induced by unusual exercise, surgical operations, dietary and alcoholic indiscretions or excessive use of fats, also by the use of certain medicines—liver extract, ergotamine tartrate (gynergen), dehydrocholic acid (decholin), thiamine hydrochloride (vitamin B<sub>1</sub>) in excessive amounts, mersalyl (salyrgan). When acute arthritis develops after such experiences or medication gout should be suspected.

*Blood Uric Acid*—An increase in the content of urates in the blood is one of the most characteristic findings in gout, but in some cases hyperuricemia is not present until several attacks have occurred. The diagnosis of gout must be considered seriously in any case in which the concentration of uric acid is more than 5 mg per hundred cubic centimeters of whole blood, especially if one or more short attacks of acute arthritis have occurred, however, hyperuricemia alone is not diagnostic of gout.

*Tophi*—Tophi containing sodium urate crystals are found only in gout. They occur most often about the margins of the ears and in the olecranon region, less often around peripheral joints. To certify that a tophus is truly present, its contents should be removed, smeared on a glass slide and examined under the microscope for the typical needle-like crystals. The murexide (chemical) test can be used for confirmation.

*Roentgen Examination*—During the early stages of the disease roentgenograms of affected joints may reveal nothing abnormal but, as attacks recur, osseous tophi make their appearance and are noted as punched out areas in juxta-articular bones of the fingers and toes especially.

*Therapeutic Test*—Colchicine, if given in sufficient doses, will usually relieve spectacularly the acute manifestations of gouty arthritis. Other forms of arthritis are unaffected by colchicine.

#### TREATMENT OF GOUTY ARTHRITIS

The underlying condition, the gout per se, is not curable at present. But certain treatments can relieve rather promptly the acute attacks, and other measures can be used in an attempt to reduce the number and severity of subsequent attacks.

*Acute Attacks*—Colchicine, the active ingredient of colchicum, is "specific" for acute attacks. Colchicum is preferable to the wine and tincture of colchicum, which often vary in potency and tend to deteriorate. To obtain relief full doses of colchicine must be used: an initial dose of 2 tablets (each  $\frac{1}{100}$  to  $\frac{1}{120}$  grain, or 0.65 to 0.53 mg) followed by 1 tablet every one or two hours until the pain is relieved and/or gastrointestinal symptoms (nausea, vomiting or diarrhea) appear. Then the administration of colchicine should be stopped.

The local application of hot water packs or warm glycerin packs helps to relieve pain, a few patients obtain more relief from cold packs or an ice bag.

Acetylsalicylic acid (60 to 80 grains, or 4 to 5.2 Gm) or sodium salicylate (60 to 100 grains, or 4 to 6.6 Gm) also should be prescribed daily during the attack, not only to aid in relieving pain, but to reduce the hyperuricemia. If colchicine and salicylates do not give adequate relief, cinchophen ( $7\frac{1}{2}$  grains, or 0.5 Gm, three or four times a day) should be used in place of the salicylates for a few days.

The diet during attacks should be free of purines, high in carbohydrates and purine free proteins (milk, eggs, cheese) and low in fats.

#### TREATMENT FOLLOWING THE ACUTE ATTACK

Few patients are able to avoid recurrences of gouty arthritis unless a definite "interval program" is persistently followed.

*Diet*—This should be low in purines, high in carbohydrates adequate in vitamins and protein (especially the purine-free proteins—milk, eggs, cheese) and low in fat. Chicken, fish and nonglandular meats are relatively low in purines and can be prescribed once a day. Other meat should be served only three or four times a week. Alcohol should be avoided entirely if at all possible. Purine-free foods can be eaten freely.

*Purine-Free Foods*—These include fruits of all kinds, milk, eggs, cheese, bread (except whole grain), vegetable soups (made without meat), caviar, shad roe, artichokes, beets, broccoli, Brussels sprouts, cabbage, carrots, celery, corn, cucumber, eggplant, endive, lettuce, okra, parsnips, potatoes, pumpkin, rutabagas, sauerkraut, string beans, summer squash, Swiss chard, tomato, turnips, hominy, macaroni, noodles, spaghetti, cereals which do not contain whole grain and pies (except mincemeat).

*Foods to Be Avoided at All Times*—These include sweetbreads, anchovies, sardines, calf and beef liver, beef kidneys, brains, meat extracts, gravies and meat soups.

*Medication*—Acetylsalicylic acid (60 to 80 grains, or 4 to 5.2 Gm) or sodium salicylate (80 to 100 grains, or 5.2 to 6.6 Gm) should be used daily for three consecutive days each week indefinitely in an attempt to control hyperuricemia. Such medication is usually fairly effective, if it is not, cinchophen ( $7\frac{1}{2}$  grains, or 0.5 Gm, three times a day) may be used instead, three consecutive days a week, but there is some danger of cinchophen toxicity. To prevent precipitation of excess urates as gravel in acid urine enough alkali should be given daily to keep the urine slightly alkaline: sodium bicarbonate (20 to 35 grains, or 1.3 to 2.3 Gm) or potassium citrate (15 to 30 grains, or 1 to 2 Gm) three times a day generally suffices.

*Exercise*—Mild, customary exercise is permissible but undue physical stress such as may be involved in vacation trips may provoke an acute attack.

*Tophi*—Large tophi may ulcerate, occasionally they become infected. These eventualities can be avoided by the early excision of tophi in which ulceration is impending. When debridement is done thoroughly prompt healing occurs.

#### COMMENT

Joint pain coming on shortly after an operation, unusual exercise, dietary and alcoholic indiscretions or excessive use of fats should make one suspect gouty

arthritis. Recurring arthritis with symptom-free intervals is of great diagnostic help. Before 1928 gout was considered a rare disease in America, but since then many cases have been recognized.

#### SUMMARY

In the foregoing discussion an attempt has been made to avoid controversial points while at the same time presenting the essential features of the more common forms of chronic arthritis.

A clear understanding of the therapeutic problems requires as a prerequisite accurate differential diagnosis, understanding of etiologic and pathogenic factors involved and patience and time, since most forms of arthritis are chronic in nature and require long continued treatment in the same manner as does tuberculosis, syphilis or diabetes.

### *Special Clinical Article*

## AVIATION MEDICINE IN THE ROYAL CANADIAN AIR FORCE

CLINICAL LECTURE AT ATLANTIC CITY SESSION

G. E. HALL, M.D.

Wing Commander, Royal Canadian Air Force  
OTTAWA, ONT.

Perhaps no other branch of medicine has advanced as rapidly and with the same degree of productiveness as has aviation medicine. The foundations for its spectacular advance were laid on necessity and, today, from an obscure sideline, aviation medicine has assumed the role of a new medical specialty which, in its most practical form, is simply the practice of industrial medicine in relation to personnel engaged in the business of flying aircraft.

The effectiveness of an aircraft is definitely limited by the least efficient member of its crew. Such effectiveness can be assured initially only by adequate selection of aircrew personnel.

The navigator, the pilot, the air gunner, the wireless operator, all have specific duties to perform while in the air, consequently the standards, medical (including psychologic), educational and so on are different for the different aircrew trades. The medical standards for fitness for flying have been laid down, not arbitrarily, but as a result of experience and investigation, and in all cases are based on service requirements of the aircrew.

#### SELECTION AND TRAINING

Although the medical examination is supposedly a rigid one, over 75 per cent of applicants are successful. Selection of the aircrew goes far beyond this single stage of medical examination and includes many special selection procedures, the discussion of which is outside the scope of this paper. However, as a result of such special selection, mentally and physically healthy young men are started on their training program. It is again the responsibility of the medical officers to maintain them in this condition throughout their service careers. Thus it is that aviation medicine may best be divided into two main divisions: selection and maintenance.

That selection and maintenance cannot be entirely separated is obvious, since the effectiveness of selection reflects itself in the non-combat wastage during training and operations. Again the problems which are evident from a maintenance point of view become more or less important, depending on the degree of consideration which any one aspect may have received at medical selection boards in the selection of the aircrew for specific duties. Therefore a balance has to be maintained between availability of personnel, selection procedures and operational requirements. For instance, it may be possible to select, with a high degree of accuracy, personnel who are capable of withstanding relatively high altitudes. By other procedures it may be possible to select personnel who have excellent night visual capacity. But the latter individuals may not be in the group with high altitude tolerance. Thus selection procedures within previously selected groups for special factors must be carried out. This is selection based entirely on operational requirements.

It must be remembered that the training program is an intensive one, courses start and are completed on schedule so that the next course of trainees may follow in rapid succession. It is obvious that many healthy, normal young men will not become successful pilots or navigators, just as obvious as is the fact that there are many persons who train as lawyers, as doctors, many who would like to be farmers or good golfers but who just haven't got that something which is necessary to make a success in a special type of work.

There is, again, a tremendous difference between learning to fly an aircraft for pleasure and being capable of flying a service aircraft in combat—just as much difference as there is in learning to play golf for pleasure and being expert enough to play tournament golf for a livelihood. To say that a pilot trainee is a failure because he has had his training discontinued is not only unfair but stupid.

Almost all whose training is interrupted are remunerated for other aircrew duties and most of them do well in their new courses. The medical officers play an important role in the readjustment and successful retraining of these men.

The problems of selection are numerous, the importance of selection is apparent. Our responsibilities follow in maintaining the effectiveness initiated through adequate selection.

#### MAINTENANCE

One aspect of the main division of maintenance of air force personnel is that concerned with public health and preventive medicine. In the Royal Canadian Air Force, as in all other branches of the services in almost all countries, inoculations and vaccinations prevent the great morbidity and mortality experienced in campaigns and wars prior to the war of 1914-1918. It is interesting to note that, in all Royal Canadian Air Force personnel since the beginning of the war, only 2 cases of typhoid have developed and no cases of tetanus have occurred in spite of training accidents.

All Royal Canadian Air Force personnel are given Dick and Schick tests. It was found that 30 per cent of personnel were Dick positive and 50 per cent were Schick positive. All who are Dick and Schick positive receive immunization inoculations. Immunization against diphtheria has been spectacularly successful.

In order to control, as well as possible, tuberculosis in the service, no enlistment or appointment is made unless the routine 6 foot roentgenogram is

a satisfactory chest condition. Admitting that the x-ray technic is not infallible in diagnosis, nevertheless tuberculosis of the chest has been reduced, at the moment at least to a negligible problem. Roentgenograms of the chest are again taken on all personnel who are retired or discharged from the service.

The seriousness of the venereal disease-gonorrhea problem cannot be underestimated, and our figures show that there are 2 new cases of venereal disease-gonorrhea per thousand men monthly. With the advent of sulfonamide drug therapy the treatment has been greatly simplified, but it requires that all men who have been treated be prohibited from flying since, among other things, a decrease in the oxygen saturation of the blood usually occurs. This may be sufficient to produce anoxia at an altitude otherwise safe without the use of oxygen equipment.

Since the personnel in large operational aircraft almost always work together as a crew, sickness constitutes a relatively more serious situation in the air force than in the other services. This is particularly true in the case of preventable illnesses, such as venereal disease, wherein the individual fails in his responsibility not only to himself but to other members of his crew. As far as the Royal Canadian Air Force is concerned, venereal disease is not a moral issue, it is a clinical disease, and its prevention and treatment constitute a medical problem in the same manner as does the contagious common cold.

Many preventive measures for the control of disease have been instituted. Most of the control measures have been eminently successful but still 40 per cent of admissions to station hospitals and 25 per cent of days care is accounted for by nonspecific respiratory infections for which there appears to be no specific treatment. On the other hand, injuries account for only 7.5 per cent of all admissions and 10 per cent of all hospital days, a great proportion of which are occasioned by nonflying accidents.

Considerable use has been made of electrocardiology, and the practical application of electroencephalography, instituted as a routine procedure in April 1940, has proved to be of considerable significance not only in selection but in maintenance as well.

The relationship of aniseikonia to flying performance in the landing of aircraft has been investigated over the past eight months. Two groups were studied. In the first group were trainees who ceased training because of landing difficulties, and in the second group there were experienced pilot instructors. The amounts of aniseikonia were found to be very trivial, and no practical correlation to performance could be ascertained in the groups studied.

#### RESPONSIBILITIES OF THE MEDICAL SERVICE

The concept of the duties and responsibilities of the medical services in association with aviation have undergone many changes—changes which are logical and which have resulted in increased efficiency of the flying personnel. Let us consider some of the responsibilities. Simply because a ration is laid down, either planned or abstracted from books or journals on paper, it cannot be assumed that adequate nutrition will be supplied to the personnel consuming those particular rations. Why is this? Because (1) the men may not be receiving the exact ration as planned or (2) the loss of nutritional elements in cooking may be tremendous, in either case an inadequate diet is consumed. That

these two conditions are actually encountered has been amply demonstrated and subsequently corrected.

Records of previous wars and campaigns have indicated that vitamins A and C are particularly apt to be available in inadequate amounts for normal health and efficiency. Of course, vitamin B<sub>2</sub>, riboflavin, was an unknown identity then, but the distribution of this vitamin in foods indicates that unless milk is provided in fairly large quantities there will be an inadequacy.

In modern mechanized warfare (navy, army and air force) it has been found that the optimal requirements of certain vitamins is probably in excess of that ordinarily considered adequate for normal civilian occupations. One is apt to consider the study of such a problem in relation to the abnormal environments to which certain personnel are exposed and neglect it as a problem of general health and efficiency of personnel. This type of work has become a phase in the newer concept of aviation medicine.

Any air force is composed not only of the aircrew, to which the glamour is attached, but also of the highly important and skilled ground crew. Therefore the problems of the ground crew trades must not, as they too frequently are, be neglected. The remarkable changes in aircraft design which have occurred since the last war have led to changes in methods of construction and of materials used. At the present time potential health hazards are involved in the servicing of aircraft which were not encountered previously. Dopes, cleaning solvents and spray paints are some of the factors which necessitate an appreciation of the principles and practices of industrial hygiene and constitute another phase of our responsibility in aviation medicine. Nor does this aspect close with a consideration of possible toxic effects of these materials on the ground crew; the prevention is also a responsibility of the medical services.

In a similar manner we must consider the so-called carbon monoxide problem. Unfortunately most of our flying personnel are inclined to be carbon monoxide conscious and in many instances carbon monoxide has been tagged as the causative factor in aircraft accidents without adequate proof of its presence in dangerous concentrations in the blood of the personnel involved. It is well known that man can tolerate fairly high concentrations of carbon monoxide, but its significance in relation to aviation medicine is increased by the fact that it materially lowers the oxygen saturation of the blood. The oxygen saturation of the blood is the all important physiologic factor in altitude flying, and when carbon monoxide has decreased this value anoxia may result at an otherwise tolerated altitude.

Although the correction of the defects in the aircraft which may be responsible for the contamination of the cockpit air by carbon monoxide is purely an engineering problem, the medical officer has a distinct responsibility and must cooperate with the aeronautical engineers in order to safeguard the health and efficiency of the personnel.

A few years ago few people would have admitted that the development of flying clothing and other protective ancillary equipment was in a large measure the responsibility of the medical personnel of the air force. Consider the problem from this point of view. The heat regulation of the body is purely a physiologic function, the body being able, within limits, to compensate for changes in environmental temperatures. However, beyond these certain limits the heat production and heat loss are no longer maintained in

equilibrium, and physiologic, mental and physical disturbances result. Adequate protective clothing will supply the additional thermal insulation necessary to maintain adequate heat regulation. This is true only as a generalization. As one increases the altitude the temperature, in general, decreases at the rate of approximately 3 degrees F per thousand feet until an altitude of some 30 to 35 thousand feet is reached, at which time the temperature has decreased to about  $-67^{\circ}\text{F}$ . On the other hand, ground temperatures which are encountered by the aircrew may vary from  $-60^{\circ}\text{F}$  in northern Canada and Alaska to  $120^{\circ}\text{F}$  or more in tropical regions. Add to that the fact that the inside temperature of a metal aircraft, standing in the sun in a tropical country, may be, because of reflection, as high as  $140^{\circ}\text{F}$ . The aircrew must in many instances climb into an aircraft under these hot conditions clad in clothing which, in a relatively few minutes, will protect him from the extreme cold of high altitudes.

Another consideration which is too frequently neglected is that the degree of thermal insulation required for different areas of the body differ considerably. In order adequately to protect an individual from cold, this fact must be taken into consideration. For instance, if the hands and feet are maintained at slightly higher temperature than the rest of the body, a vasodilatation takes place which produces excess sweating over the whole body, thus increasing heat loss and after several hours producing considerable fatigue. This indicates that the problem of designing adequate flying gloves and flying boots must be done in connection with the development of flying suits.

From statistics on the incidence of frost bite in the Royal Canadian Air Force during the past winter we find that among Canadians the fingers are most commonly affected, whereas with the Royal Air Force, New Zealand and Australian, and Americans from the Southern states the ears, hands and feet are also affected. The latter individuals are affected chiefly because of a lack of respect for cold, sunny Canadian winter days, which is gained with a few weeks experience. The effect on the fingers, though, is a problem. It is caused by two different factors, both of which can be remedied.

In the first instance certain members of the aircrew must, in order to carry out their specific duties, remove their heavy flying gloves. A few minutes exposure, while taking an astial sight, at  $20$  below zero, is sufficient to produce frostbite. The solution appears obvious. Supply them with a thin, light pair of inner gloves. What work goes into the development of adequate flying gloves? What materials are available? Silk? No. Are substitute materials available? What is the relative degree of thermal insulation, the flash resistance, snag resistance? Does the material perish in the presence of gas fumes, perspiration? Does it launder well? These are but a few of the considerations necessary before a material can be selected. Then the styling specifications must be laid down on the basis of the specific duties which the aircrew must perform.

The same general development work must be completed before specifications can be drawn up for helmets, life jackets, underwear and flying suits. The purpose? Simply to provide adequate protection for the personnel—accomplished scientifically through the cooperation of textile experts, physicists, physiologists and engineers, always keeping in mind the purpose

of the article of clothing, aircraft design and as always the maintenance of efficiency of the personnel—surely a medical responsibility.

Oxygen equipment is provided to flying personnel so that they may be maintained in as nearly perfect efficiency as possible while operating at altitudes above which the efficiency would be otherwise impaired. The altitude at which oxygen is used varies in different countries and under different operational conditions. The basis of the use of oxygen is obviously physiologic. The amount of oxygen consumed by any particular individual varies with the degree of physical effort, the altitude, the temperature and several other factors. The development of oxygen equipment, naturally, must be directed toward meeting the physiologic requirements of the individual under all circumstances. Inspiratory resistances, expiratory resistances, relation between pressures and rates of flow, the thickness of regulator diaphragms—these among others are all physiologic considerations in the development of oxygen equipment. Another aspect wherein the medical personnel must cooperate actively with the engineers, the instrument designers and the production personnel is a specific responsibility and another aspect to be written into the province of aviation medicine.

How much vibration of the navigator's table, the instrument panel, the gun mountings, may be allowed in order to prevent visual and general fatigue from developing in the personnel during long flights? How large should a gun turret be? Should it be engineered purely from an aerodynamic point of view? The turret is useless unless a man, an average young adult man, can efficiently use the guns in that turret. He must wear adequate flying clothing, he must have oxygen equipment, intercommunication equipment and he must have an even chance of getting out of the turret in a hurry in case abandonment of the aircraft is necessary. There is here, in the field of aircraft design, a specific field of endeavor opening itself to advice from medical personnel.

Decompression sickness, blackout, night vision, air sickness, glare, noise and vibration, fatigue, cold, heat, nutrition, oxygen equipment, clothing—these are but a few more of the many maintenance problems which present themselves in training, in operations, in aircraft design and even in tactics.

To appreciate that our efforts can no longer be confined to purely so-called medical aspects in the field of aviation, it is only necessary to remember again that the effectiveness of an aircraft is definitely limited by the least efficient member of its crew.

One cannot conclude any general discussion on aviation medicine without referring to the work of Dr. Col. Harry Armstrong—not that he pioneered the field that was done by Bert, Haldane, Flack, Bazett, Booth, Schneider, Drinker and a host of others—but through his own researches he came to realize the extraordinary amount of work which had been conducted through the years, collected those works, analyzed the multitude of reports, confirmed or refuted many theories, told the world and after several years presented to the English-speaking world the first comprehensive treatise on aviation medicine. Today his book, even in spite of the tremendous advances in knowledge which have been made since its publication, remains as a standard reference textbook and an inspiration to every medical man in the air services not only in Canada, the United Kingdom, Australia and New Zealand but in the rest of the world as well. Truly a monumental contribution.

brought aviation medicine as a specialty to the attention of the medical profession in particular and in general to the world at large

It should not be considered that medical personnel are attempting to conduct research work and investigations into engineering or production fields. It is simply that advantage is being taken of the fundamental training of selected medical and scientific persons in attempting to solve, on a cooperative basis many of the problems which affect the health and efficiency of the air force personnel. That the medical branch must lead in many of these developments is because the problems are of a physiologic, physical and medical nature and have been, for too long, neglected by those who have perhaps not realized that maintenance of personnel is as important as selection of personnel and that these two great divisions comprise aviation medicine as it is practiced today

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION  
OF THE FOLLOWING REPORTS

H. A. CARTER Secretary

### HOLDER'S ULTRA SHORT WAVE H F CONDENSATOR NOT ACCEPTABLE

Manufacturer "Holder's H F Condensator Company, 315 Victoria Avenue Windsor Ont Canada, and 217-218 Hammond Bldg, Detroit Michigan

In the literature advertising 'Holder's Ultra Short Wave H F Condensator,' it is said that the device 'Generates FLUID Electricity with Cellular Massage—Not Diathermy' The apparatus was presented for the Council's consideration by its originator, W. E. Holder described in the advertising as "Medical Electrologist Inventor Author, Fellow International Faculty of Sciences (London England)"

Following is the firm's description of the device "The whole mechanical equipment is installed in a solid walnut cabinet. The top indicator panel is of high grade bakelite. To the cover is attached a suitable handle making the outfit portable. A suitable drawer has been installed for the purpose of placing the gas-filled electrodes, ozone generating induction pad, electrode handle and other attachments. The size is 17 inches wide, 12 inches deep 17 inches high. Weight with complete equipment is about 45 pounds. It is equipped to operate on 110 volts A C or D C current. Peak output 50 000 volts. Megacycle 100 to 28 consumption 2 Amps 20 watts DISROBING UNNECESSARY. Free from shock, sparks burns, etc or unpleasant feeling"

Three booklets were submitted by the firm, their titles are (1) 'The Common Cold' 'Sinusitis—and their aftermath—Successfully Combated by Holder's Ultra Short Wave Condensator Generating 'Fluid' Electricity with Cellular Massage' (2) 'Facts Speak Louder Than Theories—Over One Thousand International Medical and Non-Medical Practitioners Testify to the Remarkable Results Obtained by Holder's Ultra Short Wave Condensator' (3) and a booklet giving directions for using the apparatus. Each of the booklets lists a long series of diseases and conditions said to be benefited by the use of the Condensator and also carries a great number of unsigned testimonials from persons who in the main seem to be 'Naturopathic Physicians'. These 'Doctors' have apparently treated with the apparatus innumerable conditions including cataract glaucoma deafness high blood pressure, old age poliomyelitis cirrhosis of the liver and cancer

Among the specific claims made for the apparatus are the following taken from the advertising

By this current with its tremendous voltage and enormous oscillations we are able to mechanically induce the most powerful contractile response within the deepest tissues without other effect or sensation, except those inherent to such mechanical

stimulation. It is an equalizer of the nervous forces and as a decongestive agent and tonic in the most chronic conditions it is unequalled

"It hastens the elimination of waste products such as urea, carbon dioxide etc., and causes a dilatation of the cutaneous vessels. It has powerful penetrative decongestion

"It will remove early induration, thereby establishing circulation with restoration of function in processes which are the seat of local stasis. Removal of local inflammatory stasis by means of the pulsatory action of cellular massage so penetratingly induced in the tissues by the application of the glass gas-filled electrode is entirely physiological and clinically indicated, as it thereby obviates or at least minimizes other possible chronic sequelae

'Holder's Ultra Short Wave Currents are counter-irritant, tropically tonic and institute cellular massage internally, thereby acting on all cell tissue, but such would not exercise gross muscular action. Its nutritional value is beyond all question as recording instruments verify'

No critical evidence has been presented to the Council to substantiate these statements. Since the statements are garbled, it is difficult to determine just what is meant by such terms as 'institute cellular massage internally' "tropically tonic," "powerful penetrative decongestion" and "dilatation of the cutaneous vessels"

The advertising matter includes the following reference to the Council on Physical Therapy in several places. "Now while on this subject of discussing ultra short-wave diathermy it is as well after almost ten years of this controversy to quote the findings of the Council on Physical Therapy, who confirmed my statements, by the following article in the American Medical Association Journal of April 3, 1937

#### "LIMITATIONS OF SHORT WAVE DIATHERMY

"Much of the work of the Council the past year has been confined to the consideration of So-Called short wave diathermy machines. In view of the deliberations, the Council believed it was justifiable to state based on the present available evidence, the following conclusions

'1 There is no specific biologic action of high frequency currents

'2 There is no specific bactericidal action

"3 The therapeutic effect is due to the heat produced"

'Elaborating on these three conclusions the Council felt that the general practitioner would understand that when he buys a short wave diathermy machine he is simply purchasing an apparatus capable of producing heat only in the light of available evidence, it has absolutely no other specific action. The Council felt that, if this point were understood by the physician in general practice he might hesitate before purchasing an expensive apparatus because simpler mechanical means for the production of heat are available and are as efficacious in many cases

'The short wave diathermy machine is a useful therapeutic agent but in the light of the present day evidence its therapeutic effects is that of HEAT and HEAT ONLY

"(The above findings are not the work of one or two men as there are no less than 52 names of scientific investigators who undertook to find out the true facts as to the claims of what they term SO-CALLED SHORT-WAVE DIATHERMY)"

"Having now given the findings of the American Medical Association I will revert back to the activities of my opponents in England in the operation of my clinic which was doing exceptionally well, in fact I had to employ four assistants to keep pace with the work

The foregoing reference to the Council is misleading in that it is made to seem that the Council denounces the use of diathermy as a therapeutic agent. In its findings the Council reports that diathermy is useful in producing deep tissue heat. In its investigation of Holder's Condensator the Council found that, since the power of the instrument was insufficient to light a 25 watt incandescent lamp to full brilliance, it is apparent that the ability of the device to heat tissues is insufficient to meet the Council requirements. The manufacturer claims that the apparatus is therapeutically useful for purposes

other than producing heat, namely "Generates 'Fluid' Electricity" and gives "Cellular Massage." These purposes are meaningless and are unsubstantiated by any scientific evidence.

Claims are also made for the ozone produced by the apparatus. The following statements are taken from the advertising: "Ozone is considered the most effective oxidizing, germicidal, disinfecting and deodorizing agent known, and for this reason is being increasingly employed in the successful treatment of disease for disease germs cannot live in an ozonized atmosphere."

There is no question whatever that fluid electricity is generated by the Condensator, also ozone, which is designated as 'oxydul' when coming in contact with Oxygen. Of 50,000,000 to 100,000,000 oscillations per second, of 60,000 volts at 20 watts combined with the germicidal agent of 'OXYDUL' Combats the Cause of the 'Cold' Immediately, Instantaneously Relieves Sinus Pains, Banishes Hay Fever Without Heating or Burning, Shocks or Sparks, Is Soothing and Comforting."

The Council, in previous reports on ozone producing units (THE JOURNAL, April 27, 1940, p 1632, May 17, 1941, p 2268, Jan 21, 1939, p 239) has stated that ozone is ineffective as an oxidizer and that, regardless of where or how it is generated, ozone has little effect on bacteria except in strong concentrations which are harmful to human beings as well.

Apparently Holder advocates his device for the treatment of poliomyelitis, since several cases in which cures are claimed are reported in the advertising. Following is a statement taken from the advertising: "as the disease will not respond to chemical warfare there is great prospect of it responding to Ultra Short Wave H F Currents in Condensation, which not only activates the whole of the body but imparts nutritional value." The 2 cases reported are presented in a rambling and incoherent manner and cannot be considered critical evidence.

In the files of the Bureau of Investigation of the American Medical Association is a report of the commission appointed by the legislature for the investigation of cancer remedies in the province of Ontario in which Holder and his Condensator are mentioned. Following is the commission's report:

Mr Holder who manufactures and sells an electric short wave machine, appeared before the Commission and explained the theory of his treatment, and filed a copy of a pamphlet in connection with the same. He claims to have invented and perfected this machine in England and now manufactures them in Toronto. They are said to sell at \$300 each.

He advocates their use in various ailments. His treatment is what he calls the "disintoxication treatment." Contemporaneously with the use of the machine the patient goes on a diet consisting in a large part of distilled water, fruit juices, fruits and vegetables, as explained by him for a period of some two months.

While he claims to have treated cases of cancer in England by this method since coming to Canada, something over two years ago, he has not himself treated any cases.

Mr Holder's evidence before the Commission referred particularly to the treatment of cancer by this method. In his pamphlet on treatment by his invention known as "diastatic Ultra Short Wave Condensator, with Cellular Massage" or "Holder's Mystery Ray" he cites thirty nine different ailments successfully treated but cancer is not mentioned.

In his publication entitled "The Hidden Menace" he elaborates on aluminum as a cause of cancer and many other ailments, but exhaustive investigations have failed to show that the use of aluminum containers and other articles made of the metal produce any injurious effects on the human body.

In the opinion of the Commission the evidence submitted would not support a finding that Mr Holder's suggested treatment had any merit as a remedy for cancer.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, Sept 9, 1939, carried a report of the Bureau of Investigation titled "Thermo-Magnetic Cushion Fraud—W E Holder's Device is Debarred from the Mails." The Thermo-Magnetic Cushion was a rubber chair cushion containing an electric unit with connections. It was represented in some of the advertising as "The Natural Method of 'Rejuvenation'" and was said to "stop the cry of those irritated nerves responsible for the pains of menstruation, of enlarged prostate, kidney and bladder troubles, lumbago, sciatica, etc." Also this "new and simple method applies deep soothing heat to the organs of the pelvis and abdomen." The Post Office Department issued a fraud order against the concern on Dec 23, 1938 debarring from the mails the Chicago Thermo-Magnetic Cushion Company, Ruby E Morgan, Secretary, Holder's Health Aids, Inc, W E Holder, President, and their officers and agents as such.

Since the power of the Holder so-called ultra short wave high frequency condensator is insufficient to light a 25 watt incandescent lamp to full brilliance, it is obvious that, in view of the studies of the Council on Physical Therapy, the ability of the device to heat tissue cannot meet the Council's requirements.

Although the manufacturer states that this unit is not a diathermy apparatus, actually it is, according to the terminology employed by the Council on Physical Therapy. It is a spark gap type of diathermy of such low output that there is a negligible amount of heating produced in the tissues. Because the Council's investigations indicate that the only proved clinical effect of short wave high frequency currents results from the heating which is produced, and because this particular high frequency apparatus produces a negligible amount of heating, no beneficial physiologic effects can be expected to be obtained from it. Evidence submitted by Mr Holder fails to substantiate the therapeutic claims made for the appliance.

Furthermore, the literature submitted by the manufacturer in support of his claims is misleading. Recently this manufacturer in conjunction with his promotion of the "Condensator," has promoted a method for prevention of radio interference which he claims for his own. Inspection of the literature describing his screening method of prevention of radio interference indicated that he is merely employing an ordinary screened enclosure for this purpose. This method of preventing radio interference is common knowledge among all radio engineers.

In view of the aforementioned, the Council on Physical Therapy voted not to include the Holder's Short Wave H F Condensator in its list of accepted devices.

#### TENTATIVE STANDARD PROCEDURE FOR EVALUATING THE PERCENTAGE OF USEFUL HEARING LOSS IN MEDICOLEGAL CASES

IN 1938 THE LACK OF UNIFORMITY IN ESTIMATING THE PERCENTAGE LOSS OF USEFUL HEARING AS POINTED OUT BY COURTS OF LAW, INSURANCE COMPANIES, COMPENSATION COURTS AND OTHERS CAUSED THE CONSULTANTS ON AUDIOMETERS AND HEARING AIDS OF THE COUNCIL ON PHYSICAL THERAPY TO FORMULATE A METHOD FOR THE CONSIDERATION OF OTOLOGISTS AND PHYSICIANS. THE HOUSE OF DELEGATES AT ITS ANNUAL MEETING IN 1939 APPROVED THE ACTION OF THE CONSULTANTS FOR THE STANDARDIZATION OF TESTS AND THE PREPARATION OF A METHOD FOR ESTIMATING THE PERCENTAGE LOSS OF HEARING.

THE FOLLOWING METHOD HAS BEEN PREPARED BY THE CONSULTANTS AND ADOPTED BY THE COUNCIL ON PHYSICAL THERAPY AND THE SECTION ON LARYNGOLOGY, OTOLGY AND RHINOLOGY AT THE ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION IN 1942 AND BY THE HOUSE OF DELEGATES AT ITS ANNUAL MEETING IN ATLANTIC CITY IN JUNE 1943.

THE COUNCIL ON PHYSICAL THERAPY WISHES TO EXPRESS ITS APPRECIATION FOR THE VALUABLE ASSISTANCE RENDERED IN THE PREPARATION OF THIS REPORT TO DR. C. C. BUNCH (DECEASED), GEORGE M. CHASE, EDWIN P. FOWLER, W. E. GROVE, ISAAC H. JONES, DOUGLAS MALFORD, C. STEWART NASH, HORACE NEWHART, PAUL E. SARINE, BLAIR R. SHURLY AND WILLIAM P. WHERRY, (DECEASED).

HOWARD A. CARTER, Secretary

1 Since the pure tone audiometer is the best available instrument for determining the loss of acuity of hearing, the procedure recommended herein is based on measurements of hearing loss with an accepted standard audiometer. Since, in the present state of knowledge, it is not possible to arrive at quantitative evaluation of hearing impairment except by audiometric measurements, no consideration is given to other than audiometric findings in setting up this basic procedure.

2 The recommended procedure is based only on the measurements of acuity of hearing for air conducted hearing.

3 The following decibel losses, as measured by an accepted standard audiometer, represent 100 per cent loss of hearing.

|     |     |     |       |       |       |            |
|-----|-----|-----|-------|-------|-------|------------|
| 128 | 256 | 512 | 1,024 | 2,048 | 4,096 | cycle/1000 |
| 65  | 80  | 85  | 95    | 95    | 90    | decibels   |

4 Percentage losses corresponding to measured hearing in the octave intervals are shown on the accompanying chart.

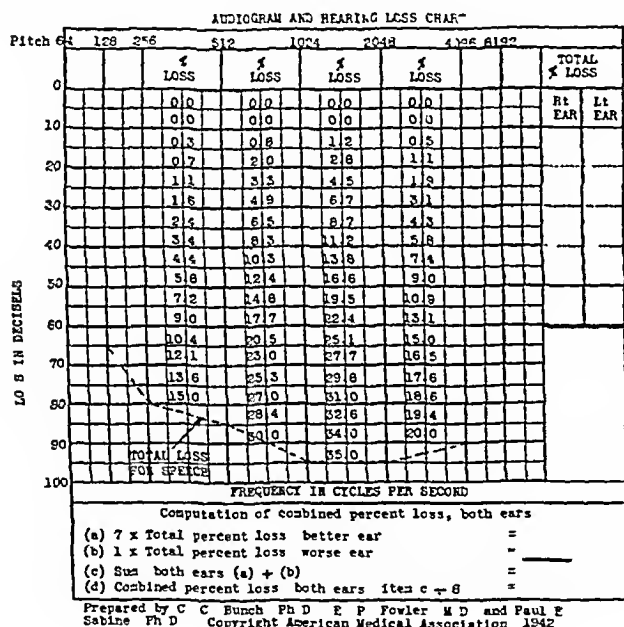

These percentages are based on existing data bearing on the relative values of the different portions of the auditory range for intelligibility of direct speech

5 In using the accompanying chart for evaluating percentage loss of hearing, the procedure is as follows

Measured hearing losses at the different frequencies for each ear are plotted in the usual manner. Successive points are connected by straight ruled lines. The percentage loss to be assigned to each octave interval is the figure in the space immediately above the straight line drawn in that octave. (When two or more spaces are intersected the average of the figures in the intersected spaces is to be taken.) The figures for the four octaves for each ear are set down in their respective columns headed Right Ear and Left Ear at the right of the chart. The sum of the figures in the column headed Right Ear is the total percentage loss of hearing for the right ear, and similarly for the left ear.

6 Computation of combined hearing loss for both ears. This computation is indicated at the bottom of the chart. The weighting of percentage loss shown by the better ear as compared with that by the worse ear of 7 to 1 represents the

Audiogram and hearing loss chart

composite judgment of the committee based on both clinical experience and practical considerations. The percentage loss of hearing is the average of the losses for the two ears taken separately weighted in the ratio of 7 to 1.

7 The percentages shown on the accompanying chart were arrived at from quantitative data to be found in the following references

- Bunch C C Usable Hearing *Ann Otol Rhin & Laryng* 49 3:9 (June) 1940
- Fletcher Harvey Speech and Hearing New York D Van Nostrand Company Inc 1929 pp 158 and 136
- Fowler E P Hearing Standards for Acceptance Disability and Discharge in the Military Services and in Industry *Tr Am Otol Soc* 1941
- Knudsen V O *Physical Review* 21 January 1923
- Sabine P E Estimating the Percentage Loss of Useful Hearing *Tr Am Acad Ophth & Otolaryng* March-April 1942
- Steinberg H C and Gardner M B The Auditory Significance of Hearing Loss *J Acous Soc America* 11 270 [No 3] 1940

The foregoing is recommended as a tentative standard procedure based on present knowledge of the relation between the audiometrically measured acuity of hearing and the ability to interpret direct speech in a familiar language.

This procedure is subject to revision when further authoritative data on the problem become available.

## Council on Pharmacy and Chemistry

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

ALSTIN E SMITH, M.D., Acting Secretary

**LIVER AND STOMACH PREPARATIONS** (See New and Nonofficial Remedies, 1941, p 328)

The following product has been accepted

**THE UPJOHN COMPANY, KALAMAZOO, MICH**

**Liver Liquid Extract Oral** 8 ounce bottle. A solution of the water soluble fraction extracted from mammalian liver. Each 45 cc (1½ fluidounces) represents 1 U S P oral unit.

**NORMAL HUMAN SERUM AND NORMAL HUMAN PLASMA** (See THE JOURNAL Sept 13, 1941 p 935, and the Revised Supplement to New and Nonofficial Remedies, 1941, p 30)

The following products have been accepted

**CUTTFR LABORATORIES, BERKELEY, CALIF**

**Normal Human Serum** 50 cc and 250 cc bottles. 1-10 000 sodium ethylmercuri-thiosalicylate is used as a preservative.

**Normal Human Plasma** 50 cc and 250 cc bottles. 1-10 000 sodium ethylmercuri-thiosalicylate is used as a preservative.

**SAMUEL DEUTSCH SERUM CENTER, MICHAEL REESE HOSPITAL, CHICAGO**

**Normal Human Serum** 250 cc. bottle. Merthiolate 1-10 000 is used as a preservative.

**Normal Human Serum (Diluted)** 250 cc bottle. Diluted with 250 cc of isotonic solution of sodium chloride. Merthiolate 1-10 000 is used as a preservative.

**Normal Human Plasma (Citrate)** 300 cc bottle. Merthiolate 1-10 000 is used as a preservative.

**Normal Human Plasma (Citrate) (Diluted)** 300 cc bottle. Diluted with 250 cc of isotonic solution of sodium chloride. Merthiolate 1-10,000 is used as a preservative.

**TINCTURE DIGITALIS** (See New and Nonofficial Remedies 1941 p 212)

The following dosage form has been accepted

**THE WY S MERRELL COMPANY, CINCINNATI**

**Tincture Digitalis** 1 ounce, 4 ounce, pint and gallon bottles

**SULFANILAMIDE** (See New and Nonofficial Remedies, 1941, p 503)

The following dosage form has been accepted

**CIBA PHARMACEUTICAL PRODUCTS, INC., SUMMIT, N J**

**Tablets Sulfanilamide** 0.5 Gm

**SULFAPYRIDINE** (See New and Nonofficial Remedies, 1941 p 508)

The following dosage form has been accepted

**CIBA PHARMACEUTICAL PRODUCTS, INC., SUMMIT, N J**

**Tablets Sulfapyridine** 0.5 Gm

**PHENOBARBITAL** (See New and Nonofficial Remedies, 1941 p 142)

The following dosage forms have been accepted

**SMITH-DORSEY COMPANY, LINCOLN, NEB**

**Tablets Phenobarbital** ½ grain, ¼ grain and ½ grain

**EPHEDRINE HYDROCHLORIDE** (See New and Nonofficial Remedies, 1941, p 245)

The following dosage form has been accepted

**GEORGE A BREON & COMPANY, INC., KANSAS CITY, MO**

**Solution Ephedrine Hydrochloride** 3% 1 ounce and 1 pint bottles. 0.5 per cent chlorobutanol added as preservative.

SATURDAY, AUGUST 1, 1942

## JAUNDICE FOLLOWING YELLOW FEVER VACCINATION

At his press conference in Washington on July 24, Secretary of War Henry L. Stimson reported that 28,585 cases of jaundice had developed among army personnel between January 1 and July 4 apparently from the use of vaccination against yellow fever. Of those affected, 24,057 were among troops in the United States and 4,528 among personnel abroad. The ratio of deaths was 1 for every 461 cases, or a total of 62 deaths in all. The information supplied did not state what proportion of those injected failed to develop jaundice. A report in the Washington, D. C., *Post* states that "in one camp 700 cases developed out of 15,000 men who were given the vaccine." Actually between two and two and a half millions of men have been inoculated.<sup>1</sup> The peak of incidence was in the week ended June 20, when 2,997 cases were reported in hospitals, whereas the week ended July 4 showed only 2,575 cases. In the meantime, as pointed out by Surg. Gen. James C. Magee, the form of the vaccine against yellow fever has been modified, the Surgeon General is confident that this change will eliminate the difficulty. Inquiry at the Office of the Surgeon General of the United States Navy indicated that the proportion of cases in the Navy was not as high as in the Army. Indeed so few as to be negligible.

In THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for July 18 an official release from the public relations bureau of the United States Army stated that there had been numerous admissions to Army hospitals on account of jaundice which had the characteristics of catarrhal jaundice but that the total number of cases in the entire army had not been enough to increase appreciably the admission rate for all diseases. Assurance was given further that the condition concerned was not yellow fever and should not be considered dangerous to the general public. In this connection physicians should be aware that the vaccination against yellow fever utilizes a living virus which

has been made innocuous by the usual techniques and which has the virtue, scientifically established, of building a defense against yellow fever.

The charge has been made by the *Chicago Tribune* that the medical department of the United States Army, and thereby our government has been "guilty of a grievous error of judgment." The *Tribune* asks "How did it happen that wholesale vaccinations were undertaken with a vaccine which quite obviously had not been thoroughly tested in advance?" The statement in the *Chicago Tribune* is unwarranted. Testing had been adequate. The vaccine had been tested in hundreds of thousands of cases. The procedure is, however, a new one and, as with all procedures in the field of medicine, the use of any new technic in the field may yield information which is quite different from that obtainable on preliminary testing. There is every reason to believe that vaccination against yellow fever is warranted and that the occurrence of 62 deaths and some 28,000 cases of jaundice associated with the vaccination of millions of men is far less serious than would be an epidemic of virulent yellow fever among soldiers sent to the tropical areas in which our army is now engaging the enemy.

In its editorial statement the *Chicago Tribune* says that "an inquiry is plainly indicated." That statement presupposes a stupidity on the part of medical science which is wholly unjustified. From the very moment when cases of jaundice first appeared in association with inoculation against yellow fever, the best medical talent available in the United States was concentrated on this question. In its study of epidemic and other diseases, the Army Medical Department does not depend exclusively on its peacetime personnel. It has engaged the facilities and the talent assembled by the Division of Medical Sciences of the National Research Council and it has established a consulting staff of physicians from civil life which represents the very best that the nation can supply.

The American Army has always been the most healthy army in the world. Its sickness and death rates today are, even with the temporary invalidism associated with the vaccination, far less than those of similar age groups in civilian life. This fact warranted the statement published in THE JOURNAL on July 18 that "the total number of cases in the entire army has not been enough to appreciably increase the admission rate for all diseases." By the type of editorial that has been printed in the *Chicago Tribune* has done a disservice to American medicine. Certainly by the fears it may create among soldiers now being inducted into our armed forces will injure morale and make more difficult the assembling the type of force that must be assembled to meet the challenge of our enemies. The hysteria which the editorial must have been prepared to create made impossible the kind of scientific investigation which charges such as the *Tribune* has made can be based

<sup>1</sup> See Yellow Fever Vaccination, p. 1114

## CURRENT NEEDS FOR MEDICAL AND HEALTH PERSONNEL

In an effort to determine just how large a medical personnel may be required in health departments and hospitals G St J Perrot and Harold F Dorn<sup>1</sup> of the Division of Public Health Methods, National Institute of Health, sent out a questionnaire to all such institutions. About 80 per cent, or 1,036 of the 1,272 health departments to which questionnaires were sent, reported that they now employ 16,921 technically trained full time paid persons and have existing vacancies for 1,093 persons. Needed to provide services made necessary by wartime activities is an additional 3,908 persons. If the 20 per cent of health departments which did not reply need proportionately as many persons, an estimated total of slightly more than 6,000 employees will be required by health departments. Forty per cent of these are public health nurses and 9 per cent physicians.

Private and nonfederal governmental hospitals reported that at present nearly 20,000 nonmedical professional and technical persons are needed and that planned expansion will require as many more. Forty-five per cent of these are graduate nurses and 21 per cent student nurses. "Many hospitals report that the difficulty of obtaining interns, residents and service and maintenance personnel is fully as great as the difficulty of obtaining technically trained persons. This shortage of personnel is partially the result of an increased demand for hospital service arising from the higher income of wage workers and, in certain areas, from a rapid increase in population because of the expansion of war industries. Equally important, however, is the loss of personnel, some of whom have been taken by the armed forces or governmental and military agencies needing trained persons, while others have left because higher wages and shorter hours could be obtained from employment in various war industries."

The report concludes that "the needs for personnel shown in the tables will increase as the armed forces expand, and as more and more persons are required for the expansion of war industries. With the exception of physicians, dentists and nurses, the armed forces are now training an appreciable proportion of their own requirements for technical health personnel. However, men of military age will continue to be taken for military service unless present policies are changed."

Probably no other problem of the war is as difficult from the sociologic, economic and other points of view as the problem of personnel. The training of great numbers of persons in excess of peacetime requirements may mean considerable unemployment after the war. Speeded education is likely to be incomplete and likely to result also in the appearance of many unqualified practitioners in all the professional fields when the emergency ends. Nevertheless the needs, as far as con-

cerns the protection of the public health and the provision of medical care for persons in mushroom towns and boom town areas, must be met. The problem is definitely one for the medical and public health professions. The Procurement and Assignment Service for Physicians, Dentists and Veterinarians should be able, with the complete cooperation of the medical profession, to take care of the medical aspects. During the period of the war physicians must be willing to dislocate themselves in order to meet these war needs exactly as they must be willing to volunteer for service with the armed forces as those forces require additional enlistments. If the medical profession can answer these calls as they should, the problem of postwar adjustment, with the retention of all the factors that make American medicine what it is today, is more likely to be solved suitably.

## SIGNIFICANCE OF THE LABILE METHYL GROUP

One of the more recent contributions of research is the elucidation of the part played in the mammalian organism by the "labile methyl" group, a chemical radical which is labile in the sense that it can, if need be, be transferred *in vivo* from one organic substance to another. This simple grouping has been found to be involved in lipid and in carbohydrate, as well as in protein, metabolism. Labile methyl is indispensable to the animal body and must be provided in the diet. Fortunately, the radical is found in a number of substances, including the amino acid methionine.

Much of our knowledge concerning the essential transferable methyl group has been gained from studies on the production and prevention of fatty livers. Thus it has been found that the accumulation of excess fat in the liver which occurs under particular experimental conditions may be counteracted more or less effectively by choline and by betaine, as well as by methionine or by protein containing this amino acid<sup>1</sup>. Study of the chemical makeup of these lipotropic substances reveals that they all possess one chemical group in common, namely the methyl group. Not all materials which contain this chemical grouping are, however, lipotropic. The methyl group to be effective must be capable of participation in transmethylation reactions. Ingenious experiments in which deuterium was used as an identifying element have revealed that the methyl group of methionine may be used by the rat for the synthesis of both choline and creatine<sup>2</sup>. Similarly, choline has been found to make possible the methylation of homocystine to methionine in the animal body<sup>3</sup>. A dietary deficiency of choline and of other sources of labile methyl produces in young rats a pathologic state char-

acterized by hemorrhagic degeneration of the kidneys. This condition may be prevented by choline, methionine or betaine.<sup>4</sup> The transferable methyl radical is also of importance in detoxication mechanisms in the organism. For example, the intoxication and the inhibition of growth effected by the administration of pyridine to rats may be counteracted by the inclusion of methionine or of choline and homocystine in the diets of the animals.<sup>5</sup> In the course of its detoxication, pyridine is apparently methylated to form methyl pyridinium hydroxide.

Recent research activity has already enhanced our estimate of the significance in nutrition of substances, such as choline and methionine, which bear a labile methyl radical. Further developments relating to the problem of the transferable methyl group will be awaited with interest.

## Current Comment

### "SHAM RAGE" IN MAN

The term "sham rage" has been suggested by Cannon and Britton<sup>1</sup> to describe spontaneous outbursts of motor activity in cats resembling fear and rage, resulting whenever the cortex of a cat is disconnected from the lower centers and the animal is allowed to emerge from anesthesia. This reaction, therefore, occurs in the absence of cortical and, presumably, in the absence of psychic elements. This and other evidence leaves little doubt that the integration of the processes concerned in the emotional expressions of rage and fear occurs centrally in the hypothalamus. However, the evidence available does not decide whether direct stimulation of the hypothalamus or allowing the hypothalamus to act in uninhibited fashion gives rise to the actual experience of fear, rage or any other affect as such in the human being. Now Wortis and Maurer<sup>2</sup> present 2 cases of "sham rage" in human beings, one following insulin hypoglycemia, the other following carbon monoxide poisoning. In neither case was the rage purposeful and at no time did the patients attempt to untie their restraints, strike the examiners or escape painful stimuli. In both cases there was apparent involvement of the higher centers, and the "sham rage," these workers believe, is the result of uninhibited hypothalamic discharge. They conclude also that the expression of emotion does not necessarily mean that the individual is experiencing emotion. There seems no reason, however, to accept the idea that the hypothalamus is the "emotional center" of the body. Affects and emotions are highly complicated psychosomatic processes which require, among other things, a functioning cerebral cortex.

### MEDICAL CARE IN CONNECTICUT

The medical society of the state of Connecticut has recently issued a booklet entitled "This Is Medical Care in Connecticut."<sup>1</sup> This planographed pamphlet of forty-eight pages sets forth in pictures and brief notations the story of medical care in Connecticut. Such subjects as safer childbirth, supervision of well babies, hospital care, modern diagnostic methods, control of milk borne epidemics, recreation, reeducation of the mentally ill, measures against cancer, prophylaxis against infection of minor wounds, pneumonia, industrial health and accident hazards, transfusion, blood banks and plasma, antepartum service including father-classes, and health of the individual over 50 comprise its content. The theme of the book, on page 1, is shown by a picture of a physician making a home call and the legend "Your Doctor Makes Connecticut a Healthy State." On the last page are the dates 1792 and 1942 and the statement "For one hundred and fifty years the physicians of the Connecticut State Medical Society have protected the health of the people of Connecticut." With its cover in full color bearing the state flag of Connecticut and the seal of the state medical society, its attractive pictorial handling with a minimum of text, and a map showing the distribution of hospitals in Connecticut, this booklet should enlighten Connecticut people as to what their doctors have done for them. Such interpretation of medical care by those who give it for those who receive it helps to promote understanding between doctor and patient.

### CONSERVATION OF DRUGS AND MEDICAL SUPPLIES

Elsewhere in this issue appears a statement developed by the Subcommittee on Hospital and Medical Supplies and by the Committee on Drugs and Medical Supplies of the Division of Medical Sciences of the National Research Council relative to the conservation of important materials used in medical practice. Eventually a shortage may occur, because the supply of many materials is beginning to be restricted. Obviously the supply of all materials depending on steel, aluminum, nickel, rubber, alcohol, glycerin, quinine, zinc or other similarly important elements is likely to be restricted because these are the materials that find such special purposes in the production of the instruments of warfare. There are innumerable ways in which the staffs of hospitals and physicians in their offices may conserve such materials—most important, however, being the avoidance of wastage. Far too often doctors and nurses are careless in their use of adhesive tape, withdrawing from spools more material than is actually going to be needed. Alcohol may be wasted by pouring away materials that can be easily reclaimed. Rubber gloves with the proper attention will outlast by double the length of their usual life. The American Hospital Association and staffs of various institutions should aid in such a campaign in every way possible. Posters may be prepared by such organizations and by manufacturers of such products which, distributed and posted throughout the hospital, will serve as a constant reminder to users of the necessity for careful conservation.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## CONSERVATION OF MEDICAL SUPPLIES

The medical profession and hospitals of the country must practice the most severe economy possible in the use of supplies containing materials essential to the conduct of the war. Rubber, metals, fixed equipment, chemicals and drugs must be conserved to the utmost to make the supply last for the duration of the war. Rubber gloves, when torn, should be patched, rubber drainage material should be resterilized and used again. Adhesive plaster contains rubber. Two pieces should not be used when one will suffice. Better yet, none at all should be used if a cotton bandage will be an adequate substitute. Unnecessarily large dressings should be avoided. Catgut must be conserved. Alcohol and other chemicals should be used as sparingly as possible.

It is expected that hospital supplies will be available in sufficient amount to meet the needs of civilian patients, but only if those needs are reduced to a

minimum. Enormous quantities must be supplied to the military hospitals and to our allies, despite the fact that the materials from which most of the articles are made are in demand for other purposes. Waste, however slight, must be scrupulously avoided.

This program has the endorsement of the Health Supplies Branch of the War Production Board.

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

### QUESTIONS FREQUENTLY ASKED WITH ANSWERS OFFICIALLY RELEASED BY THE BOARD

FRANK H LAHEY, CHAIRMAN

#### GRADUATES OF FOREIGN MEDICAL SCHOOLS

1 Q What can a graduate of a foreign medical school (aged 33 citizen) do to obtain a commission in some branch of the defense effort? What can he do to avoid being drafted as a private?

A If such a man is willing to be dislocated for war effort, his best opportunity would be in industrial medicine and surgery or in some of the areas in which the department of public health is seeking to locate physicians. He might be able to obtain a commission with the Army if he complies with the recently formulated conditions for class B medical school graduates.

MEN OVER 45—OVER 60

2 Q What is the program for men of 60 years of age? For those between 45 and 60?

A Men over 60 will be best utilized to take up the additional local load caused by the departure of younger men. Those between 45 and 60 would serve in this same fashion except in instances of specialists whose training makes them particularly desirable for the Army and who can obtain commissions granted for these special purposes.

#### OFFICE LEASES AND OTHER OBLIGATIONS

3 Q What happens to office leases? Payments on installment purchases? H O L C obligations?

A The Soldiers and Sailors' Civil Relief Act has been enacted by Congress to free persons in military service from harassment and injury to their civil rights during their terms

of service and thus to enable them to devote their entire energy to the defense needs of the nation. The present law, however, does not apply to office leases; it applies to leases of property used for household purposes. Pending legislation does provide a method by which office leases may be canceled. Protection is afforded in the case of installment contracts, mortgages, insurance premiums, taxes and the like. The law does not relieve you from liability but prevents the enforcement to your detriment of the terms of your agreement while you are in service. A detailed outline of the present law was published in THE JOURNAL, Jan 24 1942, page 306. The pending legislation which has already passed the House of Representatives will further safeguard the civil rights of persons in military service.

#### SELECTED APPOINTMENTS

4 Q Can one select service under a certain doctor?

A No, but one may ask for service in a certain outfit and will have to run his chances of getting it.

#### CALLED BY SELECTIVE SERVICE

5 Q What happens if a man has given his name to Procurement and Assignment? and his name is drawn by the draft but he has not been called by Procurement and Assignment?

A This man should appeal to his state Procurement and Assignment chairman to intervene on his behalf.

#### ENROLMENT AND ENLISTMENT

6 Q Is the word 'enrolment' interpreted as an 'enlistment' in the terms of the act?

A No.

#### PLACES FOR SPECIALISTS

7 Q For this emergency you speak of there are many of us between 37 and 45 who are willing to go at once if needed.

but are not certified with any board as specialists but are nevertheless capable Should we then wait for the Procurement and Assignment service to place us?

A Procurement and Assignment cannot place men Such men should request commissions, giving their professional qualifications, and they may ask that the state chairman of Procurement and Assignment write a confirmatory letter for them

INTERNSHIPS OF TWO YEARS

8 Q What is attitude toward the intern in hospitals where two years' internship is regular appointment?

A Deferment for one year's internship is all that is allowed at the present time

RESIDENTS

9 Q What will be the disposition of residents in teaching hospitals connected with medical schools?

A Procurement and Assignment is making efforts to preserve enough residents in teaching hospitals to carry on the hospital service and to assure a continuing supply of specialists

ESSENTIAL TEACHERS

10 Q I want to get into active military service, but my medical school where I am teaching says that I am necessary for that school What shall I do? Will I be looked on as a shirker if I stay at home when my associates go and risk their lives?

A This man should stay home unless he can provide his medical school with some one capable of taking his place and thus be released as available

ASSISTANT TO A SURGEON

11 Q In what way does the Procurement Board evaluate one who has been assistant to a surgeon for eight years in his total practice?

A The Procurement Board would consider such a man suitable for service with a station hospital as assistant surgeon or ward surgeon

ESSENTIAL ON HOSPITAL STAFF

12 Q On what basis do you call a man essential at a hospital? What yardstick do you use to call men essential to the hospital staff? What should the man who is 48 years of age and is on the essential list of a hospital do as to volunteering to the government service?

A Each hospital is supposed to make its own list of essential men, which is submitted to the state chairman of Procurement and Assignment If he agrees, they are considered essential, if he does not, the hospital will be required to modify its list Men on the essential list over 45 years of age should not volunteer except for highly special service

REASSIGNMENT OF MEDICAL OFFICERS IN ADMINISTRATIVE POSITIONS

Several hundred Medical Corps officers, currently engaged in such administrative posts as adjutants, inspectors and mess officers, will be reassigned "to posts in which their professional medical training can be utilized to the fullest extent," Mr Stimson said in a recent interview Medical Administrative Corps officers will replace the reassigned doctors The new move, he stated, "is part of a comprehensive plan by which the Army seeks to fill the need for about twenty thousand additional doctors by the end of 1942" and "supplements a previously announced recruiting program throughout the nation by which most of the doctors are to be obtained"

YELLOW FEVER VACCINATION

A review of the work of the Rockefeller Foundation for 1941 by the president, Raymond B Fosdick, states that in 1936 the laboratories of the International Health Division of the foundation developed a vaccine which provides active immunity against yellow fever after a single injection As a result of the war emergency the demand for this vaccine has been so great that, in order to produce it in the quantities required,

PHYSICAL QUALIFICATIONS OF MEDICAL STUDENTS

13 Q Should students who are not physically up to the army and navy standards be admitted to medical schools?

A Yes Failure to meet physical standards should not exclude promising young persons from medical education Furthermore, this type of student may be highly important in the next few years to carry on hospital and teaching work

OBSTETRICIANS

14 Q What should men doing obstetrics do?

A Men doing obstetrics should conform to the general requirements of their age group laid down for the rest of the profession

FAILURE OF PHYSICIANS TO APPLY FOR COMMISSION

15 Q If a doctor has been notified through Procurement and Assignment service that he had been selected and to apply for a commission, is it compulsory that he apply immediately? What if I don't answer questionnaire and enrolment blanks?

A It is not compulsory Certainly it is expected that physicians will cooperate, if they fail to do so, they are not doing what they should to aid our nation in meeting our great emergency

LIMITED SERVICE

16 Q—Do you wish applicants who have physical defects but could work under limited strain?

A Yes, if they can meet the requirements for limited service

SPECIALTY SERVICES

17 Q I had intended going into a specialty this summer and have been taking postgraduate work in that direction with the intention of taking a residency in that specialty this summer Is there any way in which I can possibly get into that specialty through the armed forces—such as taking courses or a residency in one of the government hospitals?

A If a man is commissioned in the Medical Corps of the Army he may request assignment to positions where he could pursue a specialty, but there is no obligation, of course, on the Medical Corps to meet his request

WAIVERS OF PHYSICAL DEFECTS

18 Q If I have a physical defect and sign a statement to that effect in applying for a commission in the Army, do I thereby waive any benefits to which I might be justly entitled?

A No The statement or affidavit does not constitute a waiver of any benefits It is merely an acknowledgment of the existence of a physical disability which would, unless waived by the Army, preclude the granting of a commission to you The statement you sign forms a basis of action by the Adjutant General's Office looking toward the waiver of your disability so that you may be accepted for military service

the foundation has had to double both its laboratory space and the number of its technicians  
The distribution of yellow fever vaccine manufactured by the foundation in New York in 1941 was as follows

|                                     | Number of Doses |
|-------------------------------------|-----------------|
| United States Army                  | 959 300         |
| United States Navy                  | 960 000         |
| United States Public Health Service | 3 000           |
| Panama Canal Zone                   | 4 000           |
| Virgin Islands                      | 12,000          |
| Total for United States government  | 1 928 300       |
| West Africa                         | 152 000         |
| South Africa                        | 158 000         |
| East Africa                         | 1,662 380       |
| Total for Africa                    | 1 972 380       |
| India                               | 1 000 000       |
| Brazil                              | 2 000 000       |
| Singapore                           | 1 000 000       |
| Grand total                         | 4 892 680       |

In addition to these amounts the United States Army and Navy have asked the foundation to supply them with 10 million doses more during 1942 In all cases, however, abroad, the vaccine is, of course, furnished without charge

SELECTIVE SERVICE REGISTRANTS IN TENNESSEE QUALIFIED  
FOR LIMITED MILITARY SERVICE

With Attention to Remediable Defects

JOE W FENN, M D

Major Medical Corps U S Army  
Chief Medical Division

HARRISON J SHULL, M D

Major Medical Corps U S Army

W C WILLIAMS, M D

State Commissioner of Health  
and

RUTH R PUFFER

Nashville, Tenn

Early in the operation of Selective Service in Tennessee it was realized that the information regarding physical findings of the examined registrants would be of value for a study of the nature and extent of the health and medical problems in Tennessee and for administrative purposes in the conduct of the program. Accordingly a procedure was developed for the analysis of each registrant's report of physical examination (Selective Service Form 200), which was completed by the local Selective Service boards during the period from Feb 15, 1941 to Jan 1, 1942. The study included also a further analysis of causes of rejections of those registrants who were sent to the Army induction stations during this period.

The purposes of the present report are twofold: namely (1) to show the nature of defects found on examination with the frequency of occurrence of these defects and (2) to present a reasonable estimate of the number of registrants qualified for limited military service who may be qualified for general military service by institution of corrective medical, surgical or dental procedures for rehabilitation.

All diseases and conditions have been coded under a detailed diagnosis code of three hundred and one title numbers for diseases and conditions. Personnel already carefully trained in coding physical defects were used to code all defects found on the report of physical examination. All coding was checked by a second coder to insure accuracy. The coded data were then transferred to especially prepared punch cards, from which tabulations were prepared.

In the tabulations for this report all diseases and conditions were divided into two groups, namely (1) diseases and conditions which may be remediable and (2) diseases and conditions which probably are not remediable. In general, the so-called remediable defects are those which can probably be corrected for a high percentage of the registrants and the registrants made available for military service. The list of remediable defects conforms in important and practical aspects to those defects considered remediable by Standards of Physical Examinations during Mobilization (MR 1-9, March 15, 1942).

The data included in the report were obtained from the physical examinations made under the jurisdiction of one hundred and thirty-three local Selective Service boards located in the ninety-five counties of Tennessee and from examinations of Tennessee selectees at Fort Oglethorpe, Georgia and Camp Forrest, Tennessee, Army induction stations. These local board examinations were made by six hundred and twenty-five civilian physicians of whom the majority were general practitioners and by specialists of varying interests both as

local board examiners and as medical advisory board members. This report includes a relatively small number of selectees (375) whose defects were first determined by army physicians without the men having been examined completely by the local board examiners.

The registrants have been classified in three groups: I-A, qualified for general military service, I-B qualified for limited military service, and IV-F, disqualified for military service.

A large proportion of the registrants classed I-A have been sent to induction stations, and if no disqualifying defects were discovered they have been inducted into the Army. Since the program was modified during the year to exclude registrants 28 years and over, some of the men 28 years and over classed

TABLE 1—Classification of 47 880 Registrants by Local Boards and Induction Stations by Color

| Color   | Total   | Classification   |             |  |             |   |             |
|---------|---------|--|-------------|--|-------------|---|-------------|
|         |         | I A<br>Qualified<br>for General<br>Military<br>Service |             | I B<br>Qualified<br>for Limited<br>Military<br>Service |             | IV F<br>Disqualified<br>for Military<br>Service |             |
|         |         | Num<br>ber   | Per<br>Cent | Num<br>ber   | Per<br>Cent | Num<br>ber                                      | Per<br>Cent |
| Total   | 47 880* | 25 181*  | 52.6        | 11 809*  | 24.8        | 10 890*   | 22.6        |
| White   | 36 795  | 20 196   | 54.9        | 7 793  | 21.2        | 6 801   | 23.9        |
| Colored | 11 075  | 4 984  | 45.0        | 4 009  | 36.7        | 2 022   | 18.3        |

\* Total includes 10 registrants of unknown color of whom 4 were accepted for general military service and 2 for limited military service and 4 were disqualified.

I-A by local boards were not sent to induction stations during the period of this study, and thus it is not known whether or not they would have been rejected.

During the period physical examination forms were received for 4 650 registrants (2,956 white and 1,694 colored registrants) classed IV-F, rejected for military service because of lack of educational qualifications. Since 3,734 of these registrants were not given a physical examination, they have not been included in this analysis. As these forms were requested for only part of the period, this cannot be said to be the entire group of registrants who lacked the required educational qualifications.

In considering the rehabilitation of registrants through correction of physical defects, probably these men who were rejected because of the lack of educational qualifications should also be considered as possible manpower for the Army. Since the physical examinations of these selectees have not been completed the number who are otherwise acceptable for military service is not known. Through educational courses many of these men may gain sufficient knowledge of elementary school work to carry through their work in the Army satisfactorily. Nearly all of these regis-

From Tennessee Selective Service Headquarters and Tennessee Department of Public Health. Acknowledgement is made to Brig Gen T A Frazier, State Director of Selective Service for his interest and cooperation.

tants may have had either no opportunity or a very limited opportunity to attend school

The classifications by local boards and induction stations of the 47,770 registrants included in this analysis are shown in table 1. Slightly over half (52.6 per cent) of these registrants were considered qualified for general military service. Of the 22,696 registrants not qualified for general military service, 20,497 were rejected by local boards and 2,199 by induction stations.

The defects found on the examination of these registrants have been studied and are shown in table 2. Some of the registrants had outstanding disqualifying defects, for instance, patients in tuberculosis hospitals or mental institutions, so that they were not examined for other conditions. Since the prevalence of diseases and conditions other than the disqualifying conditions among these men was not known, these registrants are included only in the total number examined for the disqualifying defect or condition in the study of preva-

lence of these conditions. Also some of the registrants rejected had more than one defect and all defects are considered in this table.

The most common defect or disease observed in the group of registrants examined was syphilis, which was found in 3,555 (8.3 per cent) of those examined. In the group of registrants examined for syphilis 3,502, or 8.1 per cent, were found to have syphilis other than cerebrospinal, cardiovascular or visceral syphilis and for this reason were classified as I-B. An additional 53, or 0.1 per cent, were found to have the disease in the form of cerebrospinal, cardiovascular or visceral syphilis and for these reasons were classified as IV-F. Syphilis was found to be nearly ten times as prevalent among colored as among white registrants. The second most common among these diseases or conditions was musculoskeletal defects, with 3,234 (7.4 per cent) of the men examined for these defects classed as I-B or IV-F. Other very prevalent causes of rejection were dental defects, eye defects and defects of the cardiovascular system.

TABLE 2—Results of Examinations of Each System and for Certain Diseases by Local Boards and Induction Stations, and Classification of Defect as Disqualifying or for Limited Service, by Color

| System or Disease      | Total *        |                     |          |                   |          | White          |                     |          |                   |          | Colored        |                     |          |                   |          |

lence of these conditions. Also some of the registrants rejected had more than one defect and all defects are considered in this table.

The most common defect or disease observed in the group of registrants examined was syphilis, which was found in 3,555 (8.3 per cent) of those examined. In the group of registrants examined for syphilis 3,502, or 8.1 per cent, were found to have syphilis other than cerebrospinal, cardiovascular or visceral syphilis and for this reason were classified as I-B. An additional 53, or 0.1 per cent, were found to have the disease in the form of cerebrospinal, cardiovascular or visceral syphilis and for these reasons were classified as IV-F. Syphilis was found to be nearly ten times as prevalent among colored as among white registrants. The second most common among these diseases or conditions was musculoskeletal defects, with 3,234 (7.4 per cent) of the men examined for these defects classed as I-B or IV-F. Other very prevalent causes of rejection were dental defects, eye defects and defects of the cardiovascular system.

Since according to the physical standards of the Selective Service regulations the registrants classed IV-F are

considered to have "deviations from normal function of structure causing unconditional rejection for active military service," the defects of these registrants are not considered in the following discussion of rehabilitation. However, the registrants with diseases or conditions causing them to be classed I-B (qualified for limited military service) can be considered as men who might be available for service after corrections have been made.

It was pointed out earlier in this report that many general practitioners and specialists cooperated in the examination of registrants. This must be kept clearly in mind in the following discussion, since the remediability of a defect in a given registrant depends on the findings and opinion of the examiner. Thus it can be seen that not necessarily all defects classed here as remediable would be so classified if the determination were made solely on that basis by an army examination team. Allowing for these discrepancies, it is felt that with a fair degree of accuracy a rough estimate of the number of men who may be made available for military service can be obtained.

In discussing availability for general military service of registrants qualified for limited military service, the length of time for treatment should be considered. With present methods of treatment with the sulfonamide men with gonorrhea may be reclassified for active service within six weeks or less after discovery. With for those with syphilis the course of treatment is considerably longer. In Tennessee the treatment of gonorrhea and syphilis for those registrants unable to get private physicians is being carried on by the health departments in counties with full time health officers. In the group of registrants being studied 11,869 classed I-B (qualified for limited military service) are shown in table 1. Since these registrants may have one or more diseases or conditions causing them to be I-B, the possibility of remediability is considered in relation to the number of defects severe enough to cause classification. Of these 11,869 registrants 9,445 (79.6 per cent) were found to have only one defect.

(17.9 per cent) two defects and 304 (2.6 per cent) three or more defects causing classification I-B. These data are given in detail by color in table 3.

The defects of the 9,443 registrants with one defect causing classification I-B have been divided into two

TABLE 3—Number of Defects Causing Rejection Among Registrants Qualified for Limited Military Service by Color

| Number of Defects Causing Rejection of Registrants | Total  |          | White  |          | Colored |          |
|--|--------|----------|--------|----------|---------|----------|
|  | Number | Per Cent | Number | Per Cent | Number  | Per Cent |

| One defect   | 9,443* | 79.6     | 6,197  | 79.5     | 3,944   | 79.7     |
| Two defects  | 2,122  | 17.9     | 1,416  | 18.2     | 706     | 17.4     |
| Three defects                                      | 206    | 2.2      | 162    | 2.1      | 101     | 2.6      |
| Four defects                                       | 36     | 0.3      | 22     | 0.3      | 14      | 0        |
| Five defects                                       | 1      | †        | 1      | †        |         |          |
| Six defects  | 1      | †        |        |          | 1       | †        |

\* Total includes 2 men of unknown color.  
† Less than 0.05 per cent.

groups, remediable and nonremediable. The nature of the remediable defects of this group are shown in table 4. In all, 6,476 (68.6 per cent) were considered to have remediable defects as defined earlier in the report. Primary, secondary and latent syphilis was the one defect found for 2,211 (23.4 per cent) of these men with one defect. The percentage of these men with primary, secondary or latent syphilis was much higher for the colored (52.5 per cent) than for the white men (8.2 per cent). The second, third and fourth most common among the defects classed remediable were defective and deficient teeth, hernia and gonorrhea.

In considering rehabilitation of registrants with two or more defects causing classification I-B, it was necessary to select only men with all defects remediable. For this reason the number of men with two or more defects with these defects remediable was proportionately smaller than the proportion among men with one defect. In table 5 are given the number of white registrants with two or more defects, the number of these registrants with all defects remediable and the nature

TABLE 4—Nature of Remediable Defects Among 9,443 Registrants Qualified for Limited Military Service Because of One Defect by Color

| Nature of Remediable Defects           | Total  | White | Colored |

of the remediable defects. Of the 1,601 white registrants 548 (34.2 per cent) may be considered to have remediable defects. The defects of these 548 men totaled 1,149, of which defective and deficient teeth and pyorrhea were the most common.

Similar data for colored registrants with two or more defects are given in table 6. For these colored men,

primary, secondary and latent syphilis and gonorrhea are the most common remediable defects.

The total number of registrants qualified for limited military service with remediable defects are given in table 7, by color. In all 7,543 (63.6 per cent) of the 11,869 registrants qualified for limited military service have remediable defects, and through correction and treatment these men may be made fit for military duty. The percentage of these colored registrants with

remediable defects (83.2 per cent) was found to be higher than that of the white registrants (53.3 per cent).

The nature of the 8,712 remediable defects of these 7,543 registrants is shown in thirteen groups in table 8. Primary, secondary and latent syphilis was the most common with 2,752, or 31.6 per cent of these defects, in this group. Defective and deficient teeth were the defects of 1,796 registrants and hernia of 1,293. Gonorrhea was stated for 921 registrants. The nature of the remediable defects differed considerably for white and colored registrants.

The classifications of the whole group of 47,880 registrants included in this analysis have been studied in view of availability for military service and rehabilita-

the registrants in Tennessee may be made available The proportion of colored men (approximately three fourths) appears to be higher than that of the white men (two thirds)

In view of the need for manpower for military duty, the group of registrants rejected from general military service who have defects which are considered remediable represents a large force which can be restored to service for the country This group of men with remediable defects represents American citizens on whom rests no less responsibility for military service than on their fellow citizens found to be physically acceptable Facilities are now being made available under the plan adopted by Selective Service for rehabilitating men with remediable defects in order that they may take their proper place during this national emergency and also that these men may be made physically stronger for life as healthy citizens

Summary

1 The results of examinations of 47,880 registrants by the examining physicians of the local boards in Tennessee between Feb 15, 1941 and Jan 1, 1942 and the rejections of any of these men sent to induction stations during this period have been studied

2 Slightly over one half (52 6 per cent) of the registrants were considered qualified for general military service Of the 22,696 registrants not qualified for general military service, 20,497 were rejected by local boards and 2,199 by induction stations

3 Among the 43,034 registrants on whom serologic tests were made, 8 3 per cent were found to have syphilis, with the percentage of colored men (26 3 per cent) nearly ten times that of white men (2 7 per cent) The second most common among these diseases and conditions was musculoskeletal defects, causing 7 4 per cent of these men to be classed I-B or IV-F Other very prevalent defects were teeth defects, diseases of the eyes and diseases of the cardiovascular system

4 The registrants with diseases or conditions considered them to be classed I-B (qualified for limited military service) have been considered as men who might be suitable for service after correction Their defects have been studied, and the nature of the so-called remediable defects are shown Although all defects classed "remediable" may not be considered to be correctable it is felt that a fairly accurate estimate may be made of the number of men who might be available for military service through rehabilitation

5 Of the 11,869 registrants classed I-B (qualified for limited military service), 9,443 (79 6 per cent) were found to have only one defect causing classification I-B, 2,122 (17 9 per cent) two defects causing classification I-B and 304 (2 6 per cent) three or more defects causing classification I-B

6 In all, 7,543 (63 6 per cent) of the 11,869 registrants classed I-B may have remediable defects and through correction and treatment may be prepared for general military duty

7 The nature of the 8,712 remediable defects of these 7,543 registrants was determined Primary, secondary or latent syphilis was the most common defect, 2,752 (31 6 per cent) of these defects in the group Defective and deficient teeth were the defect in 1,796 registrants, hernia for 1,293 and gonorrhea for 921

8 In addition to the 25,184 registrants classed I-A (available for general military service) 7,543 registrants who were qualified for limited military service may have remediable defects Thus in considering possible manpower for military service through correction and treatment, approximately two thirds of the registrants in Tennessee may be made available

## HARPER HOSPITAL UNIT DEPARTS

According to the *Detroit Medical News* the 'sons and daughters' of Harper Hospital, Detroit witnessed a ceremony on July 13 at which the Harper Hospital Unit, General Hospital No 17, received its colors. The hospital unit has since left for camp for training. The speakers at the ceremony were introduced by Dr Louis I Hirschman, the colors were presented by the superintendent of Harper Hospital, Dr Stewart Hamilton and were accepted by the director of the Seventeenth General Hospital Unit, Col Henry R Carstens. During World War I the Harper Hospital Unit was Base Hospital No 17. Among those who had been on the staff of both units in the two wars are Colonel Carstens, Lieut Col Edward D Spalding, Majors Clair L Douglas and Harold B Fenech, and J Donald Mabley. The roster of General Hospital No 17, as given by the *Detroit Medical News*, is as follows:

COLONELS  
Carstens Henry R  
LIEUTENANT COLONELS  
Ashley L Byron  
Spalding Edward DMAJORS  
Callaghan Thomas T  
Cook William A (D C)  
Donald Douglas  
Douglas Clair L  
Fenech Harold B  
Harris Herbert W  
Horan Thomas N  
Lemmon Charles E  
Mabley J Donald  
Meyers Solomon G  
Perkin Frank S  
Price Alvin E  
Tulloch John C  
Warren Wadsworth  
Wilcox Leslie FCAPTAINS  
Becker Abraham  
Beckwith Morris  
Fuller Hugh M  
Hollister John P

Larerge James M  
Lauppe Frederick A

Wessels Robert R  
Wun ch Richard E

worn by some of the old officers of the Army, is red edged with black but nobody on the active list of the Army has this ribbon.

Six persons at the Medical Field Service School, Carlisle Barracks Pa are entitled to the Army of Occupation of Germany Medal. In alphabetical order they are: 1 Master Sergeant Edward J Austin, sergeant major of the 32d Medical Battalion, who served in Germany as a corporal, medical department attached to the 4th Division at Neuviwed and other stations on the Rhine. 2 Col Emmett M Connor, Infantry, liaison officer at the Medical Field Service School, who served in Germany as a second lieutenant, 9th Infantry, at Coblenz. 3 Col Edgar Erskine Hume, Medical Corps, who served as a lieutenant colonel, Medical Corps, with the army of occupation in Hungary. 4 Col Albro Lefils Parsons, Medical Corps, who served as a major, Medical Corps, and member of the American military mission in Berlin. 5 Col Earl D Quinell, Medical Corps served as a captain Medical Corps 5th Division, near Luxembourg. 6 Col Archie F Reed, Infantry, who served as a second lieutenant, 30th Infantry, 3d Division, at Andremach and Mayen on the Rhine.

## AMICUS MEDICI

To keep in touch with colleagues in the military services Bronx Hospital, New York, has begun publishing a little journal under the editorship of Dr Joseph Felsen, with Dr William Wolarsky as associate editor. They hope that the pages of *Amicus Medici* will consist largely of contributions from staff members who are now serving their country. In the first issue is a letter from Lieut Isidore Bernstein giving his impressions of northern Ireland, as well as greetings from Louis Altschul, president of the board of directors of the Bronx Hospital, and from Dr Meyer Rosensohn, president of the medical board. The following physicians from this hospital are now serving in the military services:

Jules Alkoff  
David Arbuse  
Lionel S Auster  
Alfred J Bernstein  
Isidore Bernstein  
Michael H Gould  
Paul E Gutman  
Joseph H Hillman  
Paul A Kaufman  
Charles Klein  
Benjamin E Krentz  
Louis Levinstein  
Ben Lewis  
Samuel Lipschitz  
Julius K Littman  
Edward Mandell  
Leo Nadvorney  
Harry Orlov  
Abraham B Pemsler  
Saul J Reisman

Isidore Rothstein  
Manuel Scham  
Sydney Shapiro  
Jerome Silverman  
Ahner Stern  
Samuel Tripler  
Louis Weinstein  
Leo Wilson  
Emanuel Blumenfeld  
Arnold Teitlebaum  
Marvin Linick  
Daniel K Adler  
Edward J Alderman  
Harold S Kaufman  
Samuel R Manelis  
Morris R Rapoport  
Leon Singer  
Arnold Breecher  
Mervyn Schacht  
Harold H Sage  
Theodore Rosenberg

## CHICAGO PHYSICIANS LEAVE FOR THE SOUTHWEST

Dr John West, executive officer of Provident Hospital, Chicago, is reported to have resigned that position in order to accept a commission as major in a medical unit on duty in one of the Southwestern states. Dr Harold Thatcher, head of the department of dermatology at the Provident Hospital, also a major has already left for the unit. Dr Arthur Thomas has been commissioned captain, and Drs Ronald Jefferson, Earl Sheppard and E V Williams have been commissioned first lieutenants in the same hospital unit.

## MEDICAL AND SURGICAL RELIEF COMMITTEE OF AMERICA

During June supplies valued at nearly \$11,000 were shipped to first aid posts, hospitals and casualty stations in America and its possessions and to allied countries by the Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York City. The shipments included twenty-four emergency medical field sets, seven operating sets, two cases of assorted instruments, twenty-one cases of assorted drugs, three cases of laboratory equipment and one case of concentrated foods.

## MOUNT SINAI HOSPITAL UNIT CALLED INTO SERVICE

U S Army General Hospital No 3 has been ordered into service and will soon be sent to a training center. The hospital unit has been organized and equipped by Mount Sinai Hospital, New York, thus perpetuating a tradition of military service by Mount Sinai dating back to the Civil War. In the first world war the Mount Sinai Unit was Base Hospital No 3 of the American Expeditionary Forces, which during its location at Vauclaire, France, accommodated 2000 patients. The entry of the Mount Sinai Hospital Unit into active service will raise to several hundred the number of doctors, nurses, employees and trustees who have been called to active duty. Several physicians trained at Mount Sinai were serving on Bataan Peninsula and Corregidor and were reported missing. Last month Dr Goodell G Klevan, member of the staff of Mount Sinai, was lost at sea through enemy action.

## BADGE OF ARMY OF OCCUPATION OF GERMANY AWARDED

By act of Congress a new army decoration has been created known as the Army of Occupation of Germany Medal, which is being awarded to all persons who served in the United States Army at any time from the armistice until the declaration of peace and who rendered service in Germany or Austria-Hungary as a member of the army of occupation or in connection with other official duty. On account of the need for bronze the actual medal will not be struck until the war is over, but in the meantime the War Department has issued the corresponding ribbon which may now be worn by persons entitled to this decoration.

The ribbon of the Army of Occupation of Germany Medal consists of a wide central stripe of black edged with white borders, which recalls the colors of Prussia. The whole is edged with narrow stripes of red and blue separated by a wavy line. It is also the only ribbon containing black now worn by personnel of our army. The Indian Wars Campaign Badge,

# ORGANIZATION SECTION

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

*Changes in Status*—S 2248 has been reported to the House, proposing to amend the law relating to the care and custody of insane residents of Alaska. S 2368 has passed the House and Senate, proposing to eliminate the mandatory requirement that medical statements be furnished to inductees under the Selective Training and Service Act of 1940 on their discharge. S 2454 has been approved by the President, prescribing the relative rank of members of the Navy Nurse Corps in relation to commissioned officers of the Navy. H R 7273 has passed the House, proposing to authorize an appropriation not to exceed \$20,000 for maintenance and replacements of government owned reproducers for sound reproduction records for the blind. H R 7311 has been reported to the House, proposing to grant domiciliary care and medical and hospital treatment to the veterans of World War II on a parity with veterans of other wars.

*Bills Introduced*—S J Res 155, introduced by Senator Bone, Washington, proposes to direct the chairman of the War Manpower Commission to take certain steps to speed up the utilization in suitable employment of the abilities and aptitudes of all employable handicapped persons. S 2676, introduced by Senator Gillette, Iowa, for Senator Walsh, Massachusetts, and H R 7438, introduced by Representative Vinson, Georgia, propose to provide for medical care and funeral expenses for certain members of the Naval Reserve Officers' Training Corps. H R 7411, introduced by Representative Coffee, Washington, proposes to amend the Social Security Act to enable states to provide medical care for recipients of public assistance. H R 7415, introduced by Representative Celler, New York, proposes benefits for the injury, disability, death or enemy detention of

civilians and for the prevention and relief of civilian distress arising out of the present war. H R 7432, introduced by Representative Durham, North Carolina, proposes to establish a Pharmacy Corps in the Army, appointments to be made in the grade of second lieutenant from pharmacists between the ages of 21 and 32 years who are graduates of recognized schools or colleges of pharmacy requiring four years of instruction for graduation.

### DISTRICT OF COLUMBIA

*Bills Introduced*—S 2673, introduced by Senator Clark, Idaho, for Senator McCarran, Nevada, in defining the real property exempt from taxation in the District of Columbia, provides, among other things, for the exemption of hospital buildings belonging to and operated by organizations which are not organized or operated for private gain and for the exemption of school, college and university buildings belonging to and operated by institutions not organized or operated for private gain and embracing the generally recognized relationship teacher and student. H R 7406, introduced by Representative Hunter, Ohio, deals also with the exemption of real property from taxation and provides exemption for all real property used for religious, charitable, educational, scientific, hospital, clinic, orphanage, library, literary, art gallery, cemetery or other benevolent purposes when such property is used by any institution, corporation, association, trust, community chest, fund or foundation having as its objective and purpose the accomplishment of any one, or any combination, of the purposes mentioned. Exemption will be granted only if no part of the net earnings inures to the benefit of any private shareholder or individual.

## WOMAN'S AUXILIARY

### Indiana

The history of Allen County pioneers in medicine has been started by Mrs E M Van Buskirk. For the Red Cross the auxiliary is making a cross file of all persons who have qualified in junior, standard and advanced first aid. The index of names is being filed by streets, precincts and townships, so that in case of need it will be a simple matter to rush the nearest person qualified in first aid assistance to the victim. Four auxiliary members will be in the Red Cross office each half day until the work is completed. Mrs E A King has been named chairman of the Allen County Nutrition Council for Defense. Dr Jessie C Calvin, another member of the auxiliary, also has been named to the council. The March meeting of the auxiliary was a dessert-supper meeting at the Methodist Hospital. The program consisted of a symposium on "Nutrition for Defense."

"The Big Family" was the book reviewed by the LaPorte librarian at the meeting of the Woman's Auxiliary to the LaPorte County Medical Society.

### South Dakota

The annual Doctor's Day Dinner was held, March 28, at Sioux Falls. Mrs Anton Hyden, auxiliary president of the Seventh District Medical Society, introduced Eleanor Tenold, who played some piano selections, after which the Ament children did tap dancing. Dr E S Stenberg, president of the Seventh District Medical Society, spoke.

The advisory board meeting of the Woman's Auxiliary to the South Dakota State Medical Association was held in March at the home of the state president, Mrs F C Nilsson, Sioux Falls. Despite war conditions, the auxiliary reported a gain in membership of approximately 20 per cent. The state convention was held at Sioux Falls May 13-15.

The South Dakota state medical auxiliary held its annual meeting at Sioux Falls, May 13-15. The following officers were elected for the ensuing year: president, Mrs J C Hall; Miller, president-elect, Mrs D Baughman, Madison; vice president, Mrs G S Adams, Yankton; second vice president, Mrs E A Rudolph, Aberdeen; recording secretary, Mr Edwin S Stenberg, Sioux Falls; corresponding secretary, Mrs E Trent Stout, Pierre. A luncheon and show followed the business session. In the afternoon there was a tea at the home of Mrs E E Gage, Riverview Hotel, followed by a banquet at the Coliseum in conjunction with allied professional groups.

### Ohio

The annual meeting of the Woman's Auxiliary to the Ohio State Medical Association was held in Columbus on April 29 and 30. The president, Mrs W W H Curtiss, introduced Mrs Ralph W Hoffman, convention chairman. Dr I D J McCormick, now president of the Ohio State Medical Association, gave a talk on medicine—past, present and future. Mrs Dale P Osborn, now president of the woman's auxiliary, reported that Ohio had thirty-one counties organized with a membership of one thousand, six hundred and seventy. The treasurer's report was as follows: receipts \$1,919.59; expenditures \$1,125.09; scholarship fund \$411.24; sinking fund \$42.11; in checking account \$298.26. It was voted to establish a ship loan fund for nurses. Other officers elected were: Mrs R B Poling, Youngstown, vice president; Mrs M E Kishman, Lorain, secretary and treasurer; Mrs J Stevens, Mansfield, president-elect. It was voted to urge the national auxiliary to take some action at Atlantic City regarding the dues of wives whose husbands are in the service.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Geiger Award in Public Health**—Miss Grace Louise Ivanhoe MS El Cerrito, who recently completed work in parasitology and tropical medicine at Tulane University of Louisiana School of Medicine, New Orleans has been awarded the Geiger Medal for an outstanding thesis in the field of public health and sanitation. The Geiger Medal has for a number of years been presented to a graduate student on a public health problem of interest to the Southern states or countries contiguous to these states. Miss Ivanhoe's research work was largely concerned with amebiasis.

### COLORADO

**Society News**—Dr Leo L J Hardt Chicago, discussed 'Gastroscopic Findings in Far Advanced Pulmonary Tuberculosis' before the Denver Sanatorium Association, May 19.—The theoretical and practical basis of blood transfusions was discussed by Drs William A H Rettberg and Edward R Mugrage both of Denver, before the Medical Society of the City and County of Denver recently. The society was addressed, June 2, by Drs Paul J Connor and Robert P Johnston, both of Denver on 'Tropical War Medicine' and 'Treatment of Fracture of Neck of Femur by Osteosynthetic Tube' respectively. Dr Guy C Cary Grand Junction president of the state medical society, also spoke.—The Northeast Colorado Medical Society was addressed on May 21 in Sterling by Dr John W Amesse Denver who spoke on 'Primitive Medicine in the Philippines' and Mr Harvey T Sethman Denver, 'Needs of the Army for Medical Men and Its Present Day Streamline Method of Selection'.

### CONNECTICUT

**Psychiatrists Elect Officers**—Dr Daniel P Griffin, Bridgeport, was elected president of the Connecticut Society for Psychiatry and Neurology at its recent annual meeting. Dr Francis M Shockley, Stamford, was chosen vice president and Dr Harry M Tiebout Greenwich, secretary-treasurer.

**Community Hospital Receives \$150,000**—Under the will of the late E Frank Bugbee, the Windham Community Memorial Hospital, Willimantic, has received a bequest of \$150,000 the income from which may be used for the general running expenses of the hospital. In addition a bequest of \$100,000 has been provided for the hospital at the death of Mrs Bugbee. Mr Bugbee was a former president of the board of directors of the hospital.

**Crippled Children Clinic**—The state department of health has opened a new state crippled children clinic at the Charlotte Hungerford Hospital, Torrington in accordance with a recommendation of the Crippled Children Technical Medical Advisory Committee of the state medical society. The first clinic was held on July 14 and subsequent clinics will be conducted on the second Tuesday of each month. The new clinic will serve children from the neighboring towns of Avon, Barkhamsted, Burlington, Canaan, Canton, Colebrook, Cornwall, Goshen, Granby, Harwinton, Hartland, Litchfield, New Hartford, Norfolk, North Canaan, Plymouth, Salisbury, Sharon, Thomaston, Torrington, Watertown and Winchester.

### INDIANA

**Abandon Serum Centers for Pneumonia**—The state department of health recently decided to close its serum centers located in different sections of the state and distribute serum instead directly from the state board of health. Under the new plan the serum will be available on request, and it is believed that the change will not interfere with prompt delivery. The new decision was made on the basis of a survey and the opinion of the pneumonia control committee of the state medical association.

**District Meetings**—Dr Howard Allison Miller Marion addressed the Eleventh Councilor District Medical Society recently in Flora on "Nonsurgical Treatment of Pelvic Conditions" and Dr James O Ritchey Indianapolis Nontuberculous Lesions of the Chest.—At a meeting of the Second Councilor

District Medical Society in Washington, June 2, the speakers were Drs James N Collins and Cyrus J Clark, Indianapolis, on 'X-Ray Films and Their Diagnosis' and 'The Cardiac as a Surgical and Obstetric Risk' respectively.

### LOUISIANA

**New State Health Officer**—Dr David E Brown, New Orleans has been appointed state health officer and president of the Louisiana Board of Health to succeed Dr Christopher L Mengis. New Orleans. Dr Mengis will continue his association with the board as assistant state health officer and director of the division of local health service in accordance with an early agreement. The latter position had been open since the resignation of Dr Ford S Williams. New Orleans to report for duty with the U S Public Health Service. Dr John S Anderson had been acting director of the division of local health service but resigned to enter private practice. Dr Brown graduated at the Memphis Hospital Medical College in 1907.

### MAINE

**Attorney Locke Elected First Nonmedical Member**—Herbert E Locke, attorney of Augusta and legal counsel for the Maine Medical Association for many years, was elected an honorary member of the association during its annual meeting in Poland Spring June 21. This is the first nonmedical membership the association has conferred.

### MARYLAND

**Three Hundred Thousand Dollars for Infantile Paralysis Study at Johns Hopkins**—The National Foundation for Infantile Paralysis has given a \$300,000 grant to Johns Hopkins University, Baltimore, for a long time study of the disease. This is the largest single grant made by the foundation since it was organized in 1938. The money will be used to establish and conduct a Center for the Study of Infantile Paralysis and Related Viruses at the medical school and will be allocated over a five year period. Work at the center will be under the direction of Dr Kenneth F Macey, professor of epidemiology in the school of hygiene and public health. Three members of the staff who will be named to assist Dr Macey include Dr Howard A Howe and Dr David Bodian, formerly of the department of anatomy in the medical school and Robert C Mellors, PhD, a biochemist from Western Reserve University School of Medicine, Cleveland. These persons have already started work. In setting up the center adequate laboratory space and facilities have been provided and resources of the new grant will permit the investigators to carry on their studies in the field as well as in the laboratory as opportunity may be presented. The ultimate objective is to gain a more complete understanding of the spread of the poliomyelitis virus not only within the human body but in the community, from one individual to another. Much additional knowledge is necessary before it will be possible to devise effective measures for the suppression of the disease.

### MASSACHUSETTS

**Faculty Changes at Tufts**—Dr Elmer W Barron a member of Tufts College Medical School Boston, since 1911 and professor of pediatrics since 1929, has been made professor emeritus of pediatrics according to the *New England Journal of Medicine*. Other changes announced include the following promotions:

Dr James M Baty, professor of pediatrics  
Dr Francis C McDonald, clinical professor of pediatrics  
Dr Richard Wagner, assistant professor of pediatrics  
Dr Bernard Appel, assistant professor of dermatology  
Dr Francis P McCarthy, lecturer in dermatology  
Harry H Powers, PhD, associate professor of biochemistry

**Headquarters for Medical Service Plan**—The Massachusetts Medical Society has established capital funds necessary to start the Massachusetts Medical Service in business and headquarters have been opened at 230 Congress Street Boston. The service is a medical care plan approved by the state society at its recent annual meeting and expected to be available to the public about September 1. Dr James C McCann, Worcester, was elected president of the Massachusetts Medical Service at the first meeting of the board of directors in Boston, June 23. The state charter was granted on May 27.

**Medicolegal Conference**—The Massachusetts Medico-Legal Society and the department of legal medicine of Harvard Medical School will cooperate in a conference at the Mallory Institute of Pathology, Boston City Hospital on September 30. The department of legal medicine will sponsor a postgraduate course October 1 to 3 and 8 to 10 to cover

## OREGON

**Dr Baird Named Acting Dean of Medical School**—Dr David W. E. Baird Jr., associate dean and associate clinical professor of medicine of the University of Oregon Medical School, Portland, has been appointed acting dean of the school during the absence of Dr Richard B. Dillehunt, who has been in poor health. During the coming year Dr Dillehunt will study and rest having recently been granted a sabbatical leave by the state board of higher education. Dr Dillehunt is also clinical professor and head of the division of orthopedic surgery at the school.

**Director of Mental Hygiene Appointed**—Dr Gerhard B. Haugen, Portland, who has just completed a year of post-graduate work at Johns Hopkins University School of Hygiene and Public Health, Baltimore, is the director of the division of mental hygiene which was established last year under the supervision of the U. S. Public Health Service. The new unit was set up by Dr Curtis R. Chaffin, Portland, of the public health service, who has been acting director and who has been transferred to the U. S. Marine Hospital, Ellis Island, New York, to engage in clinical work in the neuropsychiatric division of the hospital there. Dr Haugen graduated at the University of Oregon Medical School, Portland, in 1935.

## PENNSYLVANIA

**District Meeting**—The Fifth Councilor District of the Medical Society of the State of Pennsylvania, comprising Adams, Cumberland, Dauphin, Franklin, Lancaster, Lebanon, Perry and York counties, was addressed, among others, July 9, in Harrisburg, by Drs. William Baird Stuart, Carlisle, on 'Ureteral Calculi', Harry B. Thomas, York, 'Practical Problems in Diabetes', Charles R. Reynolds, Harrisburg, major general U. S. Army, 'Tuberculosis in the War' and Edward L. R. Bortz, Philadelphia, 'New Light on Old Folks'. A feature of the meeting was the presentation of fifty year testimonial certificates by Dr. Walter F. Donaldson, Pittsburgh, secretary of the state society, to Drs. George Alvin Harter, Mavtown, Ferdinand Shoemaker, Kansas City, Mo., Joseph E. Bogar, Millersburg, Roland Jessop, York, Louis Jordy, York, George S. Kinzer, Ickesburg, Samuel W. Miller, Lancaster, Benjamin F. Myers, Chambersburg, Charles J. Stein, Red Lion and Henry Stewart, Gettysburg.

### Philadelphia

**Faculty Changes**—Three new appointments as heads of the departments of the Hahnemann Medical College and Hospital of Philadelphia were announced in the Philadelphia newspapers, July 9. Dr. William L. Martin was named professor and head of the department of surgery to succeed Dr. Gustave A. Van Lennep who becomes professor emeritus of surgery. Dr. Newlin Fell Paxson was appointed professor and head of the department of obstetrics, succeeding Dr. Warren C. Mereer, who becomes professor emeritus of obstetrics. Dr. Henry S. Ruth was made professor and head of the department of anesthesia, succeeding Dr. James M. Godfrey, who also becomes professor emeritus. Dr. William M. Sylvius, formerly professor of anatomy, was appointed professor of surgery at the school.

## SOUTH CAROLINA

**Physician Honored**—Dr. James H. McIntosh, for forty-two years a practitioner in Columbia and formerly president of the Columbia Medical Society, was presented with a silver pitcher, May 20, in recognition of his many years of service in the community. Dr. McIntosh graduated at Columbia University College of Physicians and Surgeons, New York, in 1888. He has practiced in Columbia since 1900 and has served as president of the Seventh and Second district medical societies of South Carolina, the South Carolina State Medical Association, the Tri-State Medical Association of Virginia and the Carolinas, and the Association of Surgeons of the Atlantic Coast Line Railway.

## TEXAS

**District Meeting**—The North Texas Medical Association met in Terrell, June 2, for the following program:

- Dr. Roy L. Grogan, Fort Worth: The Role of Cesarean Section in Modern Obstetrics.
- Dr. George R. Herrmann, Galveston: Interpretation of Electrocardiogram and Coronary Artery Disease.
- Dr. Albert O. Singleton, Galveston: Distention as a Complication of Abdominal Surgery, and Surgery of the Spleen.
- Dr. Milton A. Davison, Marlin: Prenatal Care.
- Dr. Milford O. Rouse, Dallas: Diagnosis and Medical Management of the Gallbladder.
- Dr. Paul M. Ramey, Temple: Surgical Treatment of the Gallbladder.

## VIRGINIA

**Special Societies**—At a meeting of the Virginia Society of Ophthalmology and Otolaryngology in Staunton, May 16, it was voted to form an associate membership which lasts for a five year period, at the end of which time the applicant is to obtain a certificate from either the national board of ophthalmology or otolaryngology or be dropped from the roll. Dr. Emmett T. Gatewood, Richmond, was named president-elect at this meeting and Dr. Guy R. Fisher, Staunton, was installed as president. Dr. Merde C. Edmunds, Petersburg, was reelected secretary-treasurer. The Society of Chest Physicians of Virginia met in Richmond recently and elected the following officers: Drs. Frank B. Stafford, Sanatorium, president, Samuel E. Hughes, Danville, vice president, and Walter L. Nalls, Richmond, secretary-treasurer.

**Changes in Health Personnel**—Dr. Ralph G. Beachley, Arlington, since 1938 director of public welfare and health in Arlington County, has been appointed assistant chief medical and liaison officer for the metropolitan area, succeeding the late Dr. William B. King. He was recently appointed regional consultant on emergency medical service for northern Virginia. Dr. Abraham L. Gelperin, Baltimore, has been appointed venereal disease control officer of Richmond effective May 15. He succeeds Dr. Aaron Wilson Brown, Pocahontas, who resigned recently to enter private practice. Dr. Paul W. Bowden, Charlotte C. H., acting health officer of Charlotte County, has been appointed epidemiologist for Richmond. Dr. William Grossman has resigned as director of the bureau of communicable diseases of the state health department, Richmond, to accept a commission in the U. S. Army. Dr. Raymond De Van Kimbrough, Norfolk, was appointed on June 1 as state venereal disease control officer for the Tidewater Area.

## WEST VIRGINIA

**Society News**—Dr. Otis G. King, Bluefield, discussed "Treatment of Diabetes" before the Fayette County Medical Society in Oak Hill, May 19. The Kanawha Medical Society was addressed in Charleston, May 12, by Dr. William Gayle Crutehfield, Charlottesville, Va., on 'Low Back Pain and Its Association with Displaced Intervertebral Disks'. Dr. Charles A. Doan, Columbus, Ohio, addressed the Ohio County Medical Society, May 8, at Wheeling on 'Differential Diagnosis and Treatment of Disease Primarily Involving the Spleen'.

## WISCONSIN

**Surgeons' Group Changes Name**—The name of the Milwaukee Society of Clinical Surgery has been changed to the Wisconsin Academy of Surgery. Future members will be required to be either a specialist certified by the American Board of Surgery or a fellow of the American College of Surgeons. There will be three meetings a year instead of the usual five. The next meeting will be on November 19.

## GENERAL

**Roentgen Ray Society Moves Meeting to Chicago**—The American Roentgen Ray Society will hold its annual meeting at the Palmer House, Chicago, September 15-18, instead of in Atlantic City, Haddon Hall, where the meeting was to be held, has been taken over by the government.

**Dr. Rose Named Director of Red Cross in the West**—Dr. Milton Rose, professor of public health administration, University of Pennsylvania School of Medicine, Philadelphia, has been appointed director of medical and health service for the Pacific area of the American Red Cross, with headquarters in San Francisco. Dr. Rose graduated at Yale University School of Medicine, New Haven, Conn., in 1935.

**Advisory Committee for Vitamin A Industry**—An informal advisory committee for the vitamin A industry has been appointed to confer with officials of the Office of Price Administration regarding pricing and distribution problems. It was announced on July 21. The committee held its first meeting in Washington, D. C., July 27, to discuss provisions of a proposed maximum price schedule for vitamin A oils and concentrates. The advisory panel is an outgrowth of a recent industry conference held in San Francisco between the Office of Price Administration and all branches of the industry.

**Insurance Examiners Directory Not Authorized**—Information has been received by the American Medical Association concerning the Medical Directors Quarterly and the Medical Examiners Guide which have been solicited through

the mails as recent as June 23. The Association has been informed that most companies have a mechanism for appointing their examiners which they have had in force for years, obviating any valid reason for this medical guide, and that no official recognition has been given to either the Medical Examiners Guide or to the Medical Directors Quarterly. Many life insurance companies use only the American Medical Directory and the Directory of Medical Specialists, depending on the Directory Report Service, published twice a month by the American Medical Association, to supplement its regular Directory. The letter soliciting subscriptions is written on a letterhead bearing the name Medical Directors Quarterly, Starks Building, Louisville, Ky., and dated June 23, 1942. Charles D. Dunne is given as the name of the publisher.

**Smallpox Incidence Low**—Only 1,432 cases of smallpox were reported in the United States in 1941, an all time low for this disease, according to the *Statistical Bulletin* of the Metropolitan Life Insurance Company. The total compares with 2,795 registered in 1940, the previous low mark for smallpox. In Canada only 26 cases were reported, all but 1 of which appeared in the province of Saskatchewan. Nearly 500,000 cases of smallpox have been reported in the United States since 1921. Indiana alone was responsible for 37,902 cases. In the past Montana, Washington, Idaho and Oregon have generally been the states with the highest incidence. The lowest incidence is found in New England and the Middle Atlantic states, followed by states in the southeast corner of the country. That Indiana has been the outstanding exception to the rule is not surprising in view of the fact that a recent investigation by its department of health disclosed that less than 13 per cent of preschool children and not more than 53 per cent of the school children under 10 years of age had been vaccinated at the time the survey was made, the bulletin stated.

**Fellowships for Latin Americans**—The Commonwealth Fund of New York is offering through the Pan American Sanitary Bureau fifteen fellowships for one year's study of public health subjects or postgraduate medical courses to properly qualified persons who are citizens of the other American republics. Fellowships in public health will be open to physicians, sanitary officers, technicians and public health nurses. These fellows will be selected through a system of cooperation with medical and health authorities of the different countries concerned, and whenever deemed advisable they will be interviewed by traveling representatives of the Pan American Sanitary Bureau. Each fellowship will provide living allowances while the holder is in the United States, travel costs and tuition. Knowledge of the English language will be among the requirements, and also the possession of certain specific qualifications. The bureau, the international health agency of the American republics, has been for some time the recognized clearing house for medical and public health fellowships in the United States, nearly one hundred Latin Americans now being in the United States under its auspices. Application blanks giving complete information will be available through the Commonwealth Fund, 41 East 57th Street, New York, the Pan American Sanitary Bureau, Washington, D. C., or chiefs of American missions in Latin America.

**Fund for De Lee Research Fellowships in Obstetrics**—Three groups have joined together to help make the memory of Joseph B. De Lee a living force by creating the Joseph B. De Lee Memorial Trust, the income of which will be used to support research fellowships in obstetrics at the Chicago Lying-in Hospital. It is expected that the fund will be formally presented during a memorial service at the University of Chicago on October 28, Dr. De Lee's birthday. This is considered a most appropriate tribute to a man who devoted fifty intensive years to establishing institutions for the care of mothers and babies and to raising the standards of training of obstetricians. The De Lee Memorial Trust will provide the best possible obstetric training for the young doctors who will hold these fellowships.

Four groups closely associated with Dr. De Lee are especially invited to contribute to the trust fund: (1) his friends, (2) the Mother's Aid group, which was founded in 1904 to assist him and ever since has worked in the cause of better obstetrics, (3) former patients and children who owe something of their own happiness to him, (4) the hundreds of doctors and nurses who received obstetric training under his guidance.

The De Lee Memorial Trust, which will be administered by the University of Chicago, will be used exclusively for the maintenance of research fellowships in obstetrics. The principal will be kept intact with the qualification that up to 5 per cent of it may be used in any one year if this is considered wise.

## FOREIGN

**Colonel Le Souef Prisoner of War**—A letter from Lt. Col. Leslie E. Le Souef, Australian Army Medical Corps, indicates that he is a prisoner in a German prison camp. Colonel Le Souef, whose home is at Perth, West Australia, was a delegate from the Western Australian branch of the British Medical Association to the American Medical Association's annual session in St. Louis in 1939, at which time he was president-elect of his branch. His letter, dated March 2, 1942, says that he is well and earning for some of his wounded compatriots. He states that limitations on prisoner mail do not make it possible for him to write to all of his many friends in the American medical profession.

**Public Health Under Hitler's Rule**—The *Deutsche medizinische Wochenschrift* of April 10 points out that overwork, haste and restlessness are causing many cases of malaria and that the taking of sleeping medicine has become a menace to public health. Prof. F. Hoff quotes Dr. Conti as saying that "the misuse of sleeping drafts is today so widespread that it is quite unbearable." The same publication states that in Lwow the Behringwerke has equipped a new laboratory for producing typhus serum and other measures are being taken to combat typhus. All inhabitants are required to visit the delousing stations and also to observe special village wash days, and all linen must be washed under public control. According to the *Bulletin des eidgegenessischen Gesundheitsamtes*, Bern, volume 4, 1941, there were 1,103 cases of typhus in the "Wartheland" from January to June 1941, whereas from 1931 to 1939 there were only 27 cases.

According to the *Berliner Borsen-Zeitung* of May 2, Dr. Conti, health leader in the reich, declared that the German people are very healthy. He said that in the old reich there were 16 cases of typhus among Volksdeutsche and 62 cases among foreigners last year, while in the occupied areas 8 Germans, 220 foreigners and 672 Jews suffered from typhus during the same period. German prophylactic methods, Dr. Conti is reported to have said, have proved to be excellent. Influenza did not occur at all last winter. The crisis in scarlet fever has passed and diphtheria has been successfully fought. Despite the war, Dr. Conti said that only about 100,000 fewer children were born last year in greater Germany as compared with 1940. The infant mortality was no worse, and the death rate of mothers has been improved. The youth of Germany, he said, is healthy. Three thousand doctors are being turned out from the universities every year and "this is a very good thing since doctors are needed."

The Charleroi Medical Society has opposed the official established Doctors' Chamber, of which every doctor is required to become a member. The society sent a circular to its members summoning them to a meeting on May 17 at the Café de Colombophiles in Charleroi and pointing out that Rommel's decree cannot be accepted and adding that "in these dark days, some try to enslave medicine. Medicine needs its freedom to fulfil its mission." The circular was signed by Dr. Mayeur, president, and Dr. Dufour, secretary.

According to *Transocean* the police in Athens, May 1, ordered the closing of all theaters, schools, concert halls, movie houses in order to protect the public against epidemic diseases. According to *Svenska Dagbladet*, Stockholm, May 20, all "obviously insanitary persons" have been forbidden to use public vehicles, in connection with recent measures taken to check the spread of typhus.

Correspondents have reported, according to *Ny Dagbladet*, May 15, that the food situation in Helsinki is critical and will continue so for two months. Several cases of scurvy have been reported from Helsinki as having been caused by the diet. According to the *Deutsche medizinische Wochenschrift*, Leipzig, May 8, Germans who have to stay for a long period in the occupied territories are advised to be vaccinated against typhus and typhoid, and, if they have to stay in the eastern territories in the east or "in the General Government," should be vaccinated "in good time against spotted fever as well."

The Dutch Ambulance Corps, according to *Volkskrant*, Utrecht, May 8, is urging doctors and dentists and nurses to join the ambulance corps on the eastern front.

## CORRECTION

**Dr. H. Grady Callison**—In this issue of the *Journal*, 1030, in the item entitled State Civilian Defense Commission in U. S. Public Health Service, under the title of Dr. H. Grady Callison should have been Chief of Emergency Medical Service and not Chief.

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

June 20 1942

#### Control of Supply of Rubber Gloves

The reduction of rubber supplies due to the occupation of Malaya by the Japanese has made necessary restriction of the supply of rubber gloves to those whose use of them is essential. The supply of gloves to hospitals and medical institutions and through them to physicians, nurses and midwives will be controlled by the Ministry of Health. These persons must apply to the local health authority entitling them to obtain gloves. Physicians and nurses can obtain only three pairs, district nurses two pairs and nurses in private practice one pair. Hospitals and clinics can obtain gloves only on certificates issued by the public health authorities. The number they can obtain will depend on the circumstances, of which the more important are the number of beds and the number of operations performed.

#### Economy in Use of Alcohol in Prescriptions

The General Medical Council has issued a fifth addendum to the British Pharmacopoeia with the main object of economizing alcohol. The minister of health has accordingly issued a 'scarce substances order' setting out approved alternatives when certain spirits and tinctures are prescribed. Physicians have the right to mark the new scarce substances with the letters "N A" meaning 'No alternative to be dispensed,' but as the Medical Research Council has agreed that the concentrated preparations of the fifth addendum with a few other preparations included in this order, present substantially the same therapeutic activity as the original spirits and tinctures, the chief difference being less alcohol, it is hoped that prescribers will generally abstain from so marking prescriptions. The following are some of the scarce substances with the authorized alternative in parentheses: Spiritus Aetheris Nitrosi (a mixture of 1 volume of Liquor Aethylis Nitritus and 7 volumes of water), Spiritus Ammoniae Aromaticus (Liquor Ammoniae Aromaticus), Spiritus Menthae Piperitae (Emulsio Menthae Piperitae), Tinctura Belladonnae (a mixture of 1 volume of Extractum Belladonnae Liquidum and 24 volumes of water), Tinctura Colchici (a mixture of 1 volume of Extractum Colchici Liquidum and 9 volumes of water).

#### The Threat of Poison Gas

Mr Churchill has warned Hitler that if he uses poison gas against the Russians our response will be gas attacks on military objectives in Germany. Precautions are being taken in view of the possibility of a gas attack on this country. The Ministry of Health has issued a circular pointing out that every one should get from the pharmacists the official bleach cream for application to splashes of blister gas on the skin. The two best known blister gases are oily liquids—mustard gas which smells like onions or garlic and lewisite which smells like geraniums. Soap and water should be used to wash the whole body so as to remove any gas which may have reached the skin directly or through the clothes. All houses must be open to persons splashed who cannot get to decontamination stations and soap and water must be provided for them. To prevent contamination of the house, visitors should be asked to take off their shoes and stockings and outer clothing before entering. If the eyes have been splashed an eye bath should not be used but a gentle stream of warm water should be directed into each eye from a faucet or from a vessel with a spout. If this is not possible the eyes should be dipped in a bowl of warm water and opened and closed under water. If the hair is splashed, the affected part should be cut off and anti gas ointment applied to the scalp.

#### No White Bread for Invalids

The abolition as the result of war conditions, of that debased cereal food white bread has been described in previous letters. It has been suggested that a special white loaf should be available for invalids or persons suffering from stomach troubles, but the government will not agree to this, as Lord Horder has advised the Ministry of Food that wheatmeal bread is perfectly suitable for those who suffer from duodenal ulcers and similar complaints. Tests carried out at St Bartholomew's Hospital showed that persons suffering from stomach troubles who had been fed on wholemeal bread thrived on it.

#### London University in Wartime

The report on the work of London University during the past year shows that in spite of financial and other difficulties due to the war it remains a valuable institution which is producing skilled men and women both for war work and for playing a useful part in reconstruction after victory. In 1938-1939 there were 14,587 internal and 10,893 external students. In 1940-1941 (the first complete war year) the figures were 8916 and 8840. The smaller diminution on the external side is explained by the fact that evacuation has not hit it as much as it has dislocated the collegiate side. Moreover, many serving members of the armed forces are pursuing courses or study as external students. The figures for 1941-1942 are not yet complete but there appears to be a slight increase in both internal and external students. In the latter it is in faculties whose work is most directly related to the war effort—science and engineering—that numbers are best maintained.

Turning to students attending schools of the university, there is a sharp distinction between the medical and nonmedical schools. In 1940-1941 medical students were nearly 90 per cent of the number for 1938-1939, while nonmedical were only 56 per cent. Before the war 63 per cent of the students at nonmedical schools were men, now the proportion is only 50 per cent. In the medical schools the proportion of 90 per cent has scarcely changed. The main new problem during the year has arisen from the government's decision to call up women for national service, which has had an immediate effect on the position of women students.

#### The British Medical Students Association

The formation of the British Medical Students Association was described in *THE JOURNAL* March 21. Further details are given in *University College Hospital Magazine*. University College Medical School has played a conspicuous part in the movement. For some years before the war there existed a Medical Faculty Subcommittee of the National Union of Students. It collapsed at the beginning of the war but from the remains a London Hospital Medical Committee, composed of the secretaries of the London Hospital Students Unions, was formed. This called a national conference of medical students, from which the British Medical Students Association arose. An interhospital debate was held at the house of the British Medical Association, at which the motion 'That the Inadequacy of Medical Education Lies in the Curriculum' was carried by a majority of nearly two to one.

The British Medical Student Association at the beginning was supported by only a minority of the students. However four or five enthusiasts and four to five thousand nominal members kept it going. Within a year it obtained a request from the medical planning commission of the British Medical Association for a memorandum on medical education. Some difficulty has arisen with the other hospitals because of the prominent part played by University College Hospital. It is therefore proposed that the British Medical Students Association should sever this connection and be established on an independent basis. It is proposed that it should cooperate with the National Union of Students in matters of general students

interest but that it should make its views on medical matters known to the profession through the British Medical Association, which is prepared to serve as a medium for the exchange of views between medical students and the profession, to consult it on matters regarded as of special interest to medical students, to grant it, if required, secretarial facilities for the conduct of its business, and indirectly to insure a certain measure of continuity, which is essential to a student body but difficult to obtain.

A fact finding subcommittee of the British Medical Students Association has scheduled a list of objects: 1 To provide an organization whereby medical students can consult on matters of common interest, such as conditions of entry into the profession, the cost of medical education, the living conditions of students and safeguards for their health, the use of material in special hospitals, the examination systems and their cost, the pay of housemen, and other matters. 2 To provide a means of exchange of views between medical and other students. 3 Postwar problems. After the war the medical services may be drastically reorganized, and it will be in the interest of medical students to have an organization representing their views. 4 In future there may be a demand for physicians with administrative ability. The British Medical Students Association could provide valuable training in committee work and knowledge of the organization of medicine as a whole. 5 A panel of experts might be invited to give advice to the newly qualified on the prospects in special branches of medicine and further training. 6 Courses of lectures, both technical and general, visits to special clinics, travel abroad and exchange visits with other students, jobs in medicine during the vacation and publication of an interhospital magazine might be organized.

### The Discovery of Symptomless Tuberculosis by Mass Radiography

The National Association for the Prevention of Tuberculosis has sent a manifesto to local health authorities reflecting the considered opinion of tuberculosis experts on the value of mass radiography in the early diagnosis of pulmonary tuberculosis. It is pointed out that the disease begins without any warning to the patient. By the time he voluntarily comes for treatment it is in an advanced stage. There are about a quarter of a million cases of pulmonary tuberculosis in the British Isles, of which about 1,500 are fatal each month between the ages of 15 and 50. To prevent the disease we must discover cases in the early stage before they have become infectious. Under war conditions the disease shows a tendency to increase, as it did in the last war. The only method of detection before symptoms are produced is by x-ray examination of the chest, which by modern methods can be carried out on large numbers of people at one time. The ideal would be for every young person to be examined on leaving school and at intervals during early adult life. Boys and girls in secondary schools, technical schools, colleges and universities are at a period of life when physical and mental strain is great and the risk of tuberculosis serious. At these age periods the disease shows a tendency to increase. Regular x-ray examinations are desirable. Under the factory acts the examining surgeons examine those who enter the industry under the age of 16. X-ray examination should be included. Finally, this course should be followed by commercial firms which have large staffs in their offices and factories.

Our existing tuberculosis services can normally deal with cases of the disease sent to them. These services have grown up almost entirely since the last war. But they deal only with those who have symptoms. An advance in the detection and prevention of tuberculosis is now needed by the examination advocated. Compulsory examination is foreign to our traditions of liberty and would fail, but the public can be educated to demand the examination in their own interest.

### The Immunization of Nurses Against Diphtheria

It has been customary in isolation hospitals for many years to immunize nurses against diphtheria. Many women commence nursing at an earlier age than heretofore, and a proportion of nurses in general hospitals have been found Schick positive. The Ministry of Health has therefore sent to health officers directions as to how to extend immunization to susceptible nurses, especially those who work among children in hospitals and nurseries. For this purpose they recommend toxoid antitoxin floccules, as it tends to give rise to less reaction than alum precipitated toxoid. Three doses of 1 cc should be injected at intervals of three weeks. Any subject reacting to the control toxin in the Schick test should not receive a first dose of more than 0.5 cc. If this causes a severe reaction the subsequent doses should be reduced to 0.5 cc or less according to the severity of the reaction. Though a Schick negative reaction affords a strong presumption that under ordinary conditions the subject is unlikely to develop diphtheria, it does not exclude such a possibility in nurses and others exposed to the risk of infection. The Ministry of Health therefore considers that there is much to be said for the practice of giving a Schick negative nurses a single stimulating dose of 0.5 to 1 cc of toxoid antitoxin floccules.

### Sir Thomas Oliver

Sir Thomas Oliver, emeritus professor of medicine in the University of Durham and a leading authority on industrial hygiene, particularly lead poisoning, has died at the age of 89 years. He was in succession assistant pathologist to the Glasgow Royal Infirmary, lecturer in physiology and pathology of medicine at the University of Durham. He served on government commissions of inquiry into industrial poisoning from various glazes used in the making of pottery, phosphorus poisoning and white lead poisoning. It was largely due to his recommendation that the government abolished female labor in the white lead industry. He showed that women were more liable to suffer than men, in the proportion of 4 to 1, and that miscarriage was a common result. He edited the valuable work "Dangerous Trades, Historical, Higher Aspects of Industrial Occupations as Affecting Health." He also published an important work "Diseases of Occupation, from the Legal, Social and Medical Points of View." This dealt with all the known dangerous trades—metals, gases, electric welding—with fatigue, parasites and rescue in mines. This book filled a gap in medical literature and went through three editions. The employment of women in industry was a great anxiety to him. He was alarmed at the possible results on future generations of the strain on so many young women in munition work and other industries in the last war.

## Marriages

- NICHOLAS FREDERICK KRECKER VINCENT, East Orange, N. J., to Miss Joyce Hinkle at Camp Bowie, Texas, May 10.  
SAMUEL EDWARD WARSHAUER to Miss Miriam M. Williams of Wilmington, N. C., at Alexandria, La., May 4.  
GRADY MILTON COLSON, Goldsboro, N. C., to Miss Norris of Wilmington in Dillon, S. C., May 16.  
LESTER R. WHITAKER, Portsmouth, N. H., to Miss L. Starbuck of White Plains, N. Y., May 2.  
HENRY STOKES MUNROE JR. to Miss Martha Plathews, both of Charlotte, N. C., May 2.  
CHARLES MATTHEW KENDRICK, Valdese, N. C., to Miss Josephine Payne of Lenoir, May 16.  
CURTIS WEAL BOWMAN, Macon, Ga., to Miss Williams in Atlanta, May 16.  
VICTOR J. BIRNBERG, St. Paul, to Miss Bernice, Minn., May 10.

## Deaths

**Milton Alexander Harrington**, Vineyard Haven Mass., University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1910, member of the American Psychiatric Association, Association for Research in Nervous and Mental Disease and the American Psychopathological Association, for four years junior assistant physician at the Bloomingdale Hospital, White Plains, N. Y., and for two years senior assistant physician at the New York State Psychiatric Institute and Hospital, New York, attending specialist at Veterans Bureau Hospital 41 for many years psychiatrist for the New York State Department of Correction, formerly director of the department of psychiatry at the Institution for Male Defective Delinquents, Napanoch, N. Y., served with the Royal Army Medical Corps in France during World War I, formerly consultant in mental hygiene at Dartmouth College, Hanover, N. H., author of 'Wish Hunting in the Unconscious: a Criticism of Psychoanalysis' and 'The Biological Approach to the Problem of Human Behavior', aged 58, died May 27, of coronary thrombosis.

**Francis Sedgwick Watson**, South Dartmouth Mass., Harvard Medical School, Boston, 1879, member of the Massachusetts Medical Society, American Surgical Association, New England Surgical Society and the American Urological Association, past president of the American Association of Genito-Urinary Surgeons and was honorary president of the International Urological Society, fellow of the American College of Surgeons, clinical instructor in genitourinary surgery from 1888 to 1893, assistant in clinical surgery from 1890 to 1894, assistant in genitourinary surgery 1893-1894, instructor in genitourinary surgery from 1894 to 1901 and lecturer on genitourinary surgery from 1901 to 1909 at his alma mater, formerly on the staffs of the Boston City, Childrens and Carney hospitals and the Boston Dispensary, aged 88, died, May 5.

**Henry Wallace Grote** ☉ Bloomington Ill., Rush Medical College, Chicago, 1894, county physician of Du Page County, Ill., from 1898 to 1901, in 1921 founder and first president of the Central Illinois Radiological Society (now Illinois Radiological Society), charter member of the Radiological Society of North America, member of the American Roentgen Ray Society, International Congress of Radiology, American Congress of Internal Medicine and the American Association for the Study of Gout, past president of the McLean County Medical Society, for many years director of the roentgen laboratory at Brokaw Hospital, Normal, Ill., aged 72, died, June 20, of carcinoma of the prostate.

**Henry Christian Galster** ☉ Hudson N. Y., New York Homeopathic Medical College and Flower Hospital, New York, 1909, secretary of the Columbia County Medical Society, was decorated with the British Military Cross for services with the British Expeditionary Forces during World War I, bank president, formerly mayor of Hudson, attending ophthalmologist and otolaryngologist, Hudson City Hospital, consultant on the staffs of the Memorial Hospital of Greene County, Catskill, New York, State Training School for Girls, Hudson, and the Columbia Sanatorium, Philmont, aged 54, died, June 8, of coronary occlusion.

**Edward Raymond Ryan** ☉ Milwaukee, Marquette University School of Medicine, Milwaukee, 1917, member of the American Academy of Ophthalmology and Otolaryngology, clinical instructor in ophthalmology at his alma mater, specialist certified by the American Board of Ophthalmology, served in the U. S. Navy during World War I, director of the eye clinic at the Milwaukee County Dispensary, aged 49, died June 7, of coronary thrombosis.

**George Washington Carr** ☉ Englewood N. J., Jefferson Medical College of Philadelphia, 1895, member of the Medical Society of the State of Pennsylvania and the American Academy of Ophthalmology and Otolaryngology, for many years consulting ophthalmologist for the Lehigh Valley Railroad, formerly on the staffs of the Wilkes-Barre General Hospital and the Mercy Hospital, Wilkes-Barre, Pa., aged 69, died, June 17, of heart disease.

**George Lincoln McBride**, Grand Rapids, Mich., M.B., University of Toronto Faculty of Medicine, 1892 and M.D., Victoria University Medical Department, Coburg, Ont., Canada, 1892, at one time dean and professor of medicine at the Grand

Rapids Medical College, formerly visiting surgeon on the staff of the Butterworth Hospital, aged 77, died, May 5, of coronary thrombosis.

**George Pierson Jessup**, Staten Island, N. Y., College of Physicians and Surgeons, New York, 1890, member of the Medical Society of the State of New York, past president of the Richmond County Medical Society, aged 77, on the staffs of the Seaside Hospital and the Staten Island Hospital, where he died, May 18, of arteriosclerosis, heart disease and bronchopneumonia.

**Reuben Thomas Johnston**, Brooklyn, Boston University School of Medicine, 1903, member of the Medical Society of the State of New York, for many years president of the Eastern District Dispensary, on the staffs of the Prospect Heights Hospital, Brooklyn, Nursery and Infants' Hospital and the Cumberland Hospital, aged 64, died, May 10, of coronary sclerosis.

**Robert John Morrison**, Brooklyn, Long Island College Hospital, Brooklyn, 1891, member of the Medical Society of the State of New York, fellow of the American College of Surgeons, on the visiting staff of the Caledonian Hospital, consulting surgeon, Brooklyn Eye and Ear Hospital, aged 85, died, June 8, of carcinoma of the tongue and cardiovascular disease.

**John Lee Summerlin** ☉ Gainesville, Fla., Atlanta (Ga.) Medical College, 1916, member of the American Academy of Ophthalmology and Otolaryngology, specialist certified by the American Board of Otolaryngology, president of the Alachua County Medical Society, served during World War I, aged 52, died, May 31, of coronary thrombosis.

**James Joseph Ryan**, Buffalo, University of Buffalo School of Medicine, 1934, member of the Medical Society of the State of New York, formerly on the staffs of the J. N. Adam Memorial Hospital, Perrysburg, N. Y., and the Ideal Hospital, Endicott, N. Y., aged 33, died, June 1, in the Millard Fillmore Hospital of cerebral hemorrhage.

**Harry Andrew Shafer** ☉ Los Angeles, Eclectic Medical Institute, Cincinnati, 1899, on the staff of the Santa Monica Hospital, formerly on the staff of the Grace Hospital, Detroit, chairman of the medical committee of the Bay Area Civilian Defense Board, served during World War I, aged 66, died, May 27, of heart disease.

**Frank Burge Kimzey**, Union City, Tenn., Vanderbilt University School of Medicine, Nashville, 1926, member of the Tennessee State Medical Association, past president and secretary of the Obion County Medical Society, served during World War I, aged 41, died, May 15, of angina pectoris.

**Charles Bernstein** ☉ Rome, N. Y., Albany Medical College, 1894, member of the American Psychiatric Association, past president of the American Association for the Study of Feeble-minded, superintendent of the Rome State School, aged 69, died, June 13, of chronic interstitial nephritis.

**William John Webster Woolgar** ☉ Lyme, N. H., Western Reserve University Medical Department, Cleveland, 1898, member of the Ohio State Medical Association, aged 78, died, May 29, of bronchopneumonia, congestive heart disease, arteriosclerosis and Raynaud's disease.

**James Frederick Williams**, Joliet, Ill., Meharry Medical College, Nashville, Tenn., 1903, member of the Illinois State Medical Society, on the staffs of St. Joseph's and Silver Cross hospitals, aged 71, died May 30, of coronary sclerosis, hypertension and chronic nephritis.

**Alfred Walter Jones**, Akron, Ohio, Queens University Faculty of Medicine, Kingston, Ont., Canada, 1896, member of the Ohio State Medical Association, at one time secretary of the Summit County Medical Society, aged 70, died May 19, of coronary thrombosis.

**Joe Hartman Schantz**, New Tripoli, Pa., Temple University School of Medicine, Philadelphia, 1930, member of the Medical Society of the State of Pennsylvania, on the staff of the Allentown (Pa.) Hospital, aged 37, died, June 7, of a self-inflicted bullet wound.

**Emil Bernard Anderson** ☉ Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903, for many years on the staff of the Englewood Hospital, aged 65, died June 2, of carcinoma of the bladder.

**David Hill McCall**, Otway, Ohio, University of Louisville (Ky.) Medical Department, 1917, served as a lieutenant commander in the U. S. Navy during World War I, aged 51, died May 29, in the Mercy Hospital, Portsmouth, of myocardial failure.

**George Mortimer Smith** Ⓢ Hartford, Conn., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907, assistant surgical director of the Travelers Insurance Company, aged 56, died, June 1, of coronary thrombosis

**Ira Clinton Tyndall**, Berlin, Md., Baltimore University School of Medicine, 1896, member of the Medical and Surgical Faculty of Maryland, served as a major in the medical corps of the U S Army during World War I, aged 68, died in May

**James Alfred Maguire**, Boston, Tufts College Medical School, Boston, 1931, member of the Massachusetts Medical Society, assistant in medicine from 1935 to 1938 and since then instructor in medicine at his alma mater, aged 36, died, May 31

**Guy Howard Hutchins** Ⓢ Auburn, Maine, Medical School of Maine, Portland, 1899, formerly district health officer for Kennebec and Somerset counties, aged 65, died, May 9, in the Central Maine General Hospital, Lewiston, of lobar pneumonia

**P Henry O'Hara** Ⓢ Dayton, Ohio, Eclectic Medical Institute, Cincinnati, 1907, at one time coroner of Preble County, aged 63, died, June 12, in the Reid Memorial Hospital, Richmond, Ind., of coronary thrombosis and arteriosclerosis

**William Lowder** Ⓢ Maquoketa, Iowa, Medical College of Indiana, Indianapolis, 1894, past president and secretary of the Jackson County Medical Society, formerly county coroner, aged 76, died, June 3, of an injury received in a fall

**Eugene Ackerman** Ⓢ Bethlehem, Pa., Univerzita Komenskeho Fakulta Lekarska, Bratislava, Czechoslovakia, 1920, aged 48, on the courtesy staff of St Luke's Hospital, where he died, June 8, of a tumor of the spinal cord

**Edgar Albert Frauer**, Los Angeles, Bennett Medical College, Chicago, 1915, served during World War I, aged 52, died recently in the Veterans Administration Facility, Sawtelle, of gastric hemorrhage due to duodenal ulcer

**Tilden Hendricks Phipps Jr.**, Tampa, Fla., University of Oklahoma School of Medicine, Oklahoma City, 1937, appointed a first lieutenant in the medical reserve corps of the U S Army March 5, 1941, while in Australia, where he arrived April 7, 1942, was transferred to the 38th Bombardment Group Medical Corps, aged 30, was killed in an airplane accident, June 5, in the Far Eastern theater of war

**Floyd Kinsolving**, Hornersville, Mo., University of Louisville (Ky.) Medical Department, 1888, member of the Missouri State Medical Association, aged 79, died, May 5, in the Presnell Hospital, Kennett, of chronic asthma

**Oliver Miller Heartsill**, Marshall, Texas, Atlanta (Ga.) Medical College, 1882, University of Tennessee Medical Department, Nashville, 1886, member of the State Medical Association of Texas, aged 85, died, May 27

**Louis Koenig** Ⓢ Brooklyn, Long Island College Hospital, Brooklyn, 1907, specialist certified by the American Board of Ophthalmology, on the staff of the Jewish Hospital, aged 58, died, May 30, of cirrhosis of the liver

**George Philip Naum**, Cedar Grove, W Va., Ohio State University College of Medicine, Columbus, 1929, member of the West Virginia State Medical Association, aged 40, died, May 18, in a hospital at Charleston

**Charles E Pearson** Ⓢ Turlock, Calif., Kentucky School of Medicine, Louisville, 1898, formerly health officer of Turlock, on the visiting staff of the Emanuel Hospital, aged 64, died, May 30, of coronary occlusion

**James Robert Craig**, Ripley, Tenn., University of Nashville Medical Department, 1893, Vanderbilt University School of Medicine, Nashville, 1893, aged 70, was found dead in bed, May 15, of cardiovascular disease

**Victor Emmannuel Kea**, Atlanta, Ga., Emory University School of Medicine, Atlanta, 1918, member of the Medical Association of Georgia, served in the U S Navy during World War I, aged 52, died, May 20

**Eugene Rison Timmons**, Grand Junction, Tenn., Birmingham Medical College, 1915, member of the Tennessee State Medical Association, aged 49, died, May 24, of a malignant condition of the pancreas

**Otis Manly Patterson**, Bastrop, La., Memphis (Tenn.) Hospital Medical College, 1887, for many years coroner and health officer of Morehouse Parish, aged 81, died, May 1, of influenza and pneumonia

**Stephen Sylvester Stack** Ⓢ Milwaukee, Rush Medical College, Chicago, 1921, assistant professor of pathology at Marquette University School of Medicine, aged 46, died, May 1

**Charles P Leininger**, Pittsburgh, Western Pennsylvania Medical College, Pittsburgh, 1904, aged 61, died, May 20, of carcinoma of the colon with metastasis to the liver

**Josiah C Lloyd**, Platte, S D., State University of Iowa College of Medicine, Iowa City, 1882, aged 87, died, May 2, in Mitchell of bronchopneumonia and myocarditis

**Chauncey A Rood**, Brocton, N Y., University of Buffalo School of Medicine, 1878, member of the Medical Society of the State of New York, aged 87, died, May 2

**Zachary Peck Fletcher**, Ramsey, N J., New York Homeopathic Medical College and Hospital, New York, 1880, aged 79, died, May 22, of chronic myocarditis

**Emery Marcus Byers**, Genoa, Ill., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1898, aged 70, died, May 22

**William George Walker**, Houston, Texas, Keokuk (Iowa) Medical College of Physicians and Surgeons, 1897, aged 63, died, May 17, in a local hospital

**Benjamin Woloshin** Ⓢ New York, Long Island College Hospital, Brooklyn, 1915, on the staff of the Bronx Hospital, aged 49, died, May 26, of carcinoma

**Emile Ostiguy**, Montreal, Que., Canada, M B, Victoria University Medical Department, Coburg, Ont., 1887, and M D in 1889, aged 75, died recently

**Edward E Underwood**, Frankfort, Ky., Western Reserve University Medical Department, Cleveland, 1891, aged 77, died, May 31, of cardiorenal disease

**Irving Edwin Sauber**, Wallingford, Conn., George Washington University School of Medicine, Washington, D C, 1927, aged 41, died, May 11

**Warren Bassett Klinefelter**, Chicago, City, Iowa, Hering Medical College, Chicago, 1895, aged 83, died, May 18, of cerebral hemorrhage

**Loren Hoover** Ⓢ Decker, Ind., Medical College of Indiana, Indianapolis, 1892, aged 74, died, May 29, in St Mary's Hospital, Evansville

**Benjamin H Harrison**, Burlison, Tenn. (licensed in Tennessee in 1911), aged 69, died, May 14, of chronic valvular heart disease

**Frank Leroy Baker**, Fayette, Iowa, Hahnemann Medical College and Hospital, Chicago, 1904, aged 65, died, May 1, of nephritis

**Lynn Murray Jones** Ⓢ Dayton, Ohio, Ohio Medical University, Columbus, 1898, aged 71, died, May 3, of cirrhosis

**Joseph Patrick Armstrong**, Ottawa, Ont., Carleton University of Toronto Faculty of Medicine, 1927, aged 44, died, April 4

**Augustus L Craig**, Chicago, Rush Medical College, 1878, aged 88, died, May 25, of carcinoma of the stomach

**Charles E Anderson**, St Louis, American Medical College, St Louis, 1891, aged 83, died, May 23, of acute myocarditis

**George W Alexander**, Beachburg, Ont., Canadian Medical College, Toronto, 1899, died, April 6

**Richard Marion Murphey**, Belleville, Ark. (licensed in Arkansas in 1903), aged 62, died, May 8

**John C Stovall**, Turin, Ga., Atlanta Medical College, 1894, aged 72, died, April 23

#### DIED IN ARMY SERVICE

TILDEN H PHIPPS JR, M D  
1911-1942

## Bureau of Investigation

### MISBRANDED PRODUCTS

#### Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the United States Department of Agriculture

[EDITORIAL NOTE—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods, F N J. The abstracts that follow are given in the briefest possible form (1) the name of the product, (2) the name of the manufacturer, shipper or consigner (3) the date of shipment (4) the composition (5) the type of nostrum (6) the reason for the charge of misbranding and (7) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

**Alpine Tea**—Alpine Tea Company, Detroit, Sept. 2, 1949. Composition: cut dried leaves of blueberry. Misbranded because label falsely represented that the product would balance the deficiency of body minerals, stimulate the pancreatic glands, kidneys, bladder and liver, increase vitality amazingly and almost immediately help one get a good night's rest, serve as an effective aid to the diabetic person's diet and lessen the need for insulin. Further misbranded because the numerous mineral salts named with their respective alleged amounts on the label did not represent an analysis of the product itself.—[D D N J F D C 348 March 1942]

**Ancestral Oil**—Ancestral Medicine Company, Oawatomie, Kan., April 26, 1940. Composition: essentially a fish oil and turpentine. Misbranded because among other things falsely represented on label to be an effective treatment of hemorrhoids, rheumatism, hay fever, asthma, kidney ailments, tuberculosis, pneumonia and many other disorders. Further misbranded because label did not accurately state the quantities of the ingredients or give their common names.—[D D N J F D C 359 March 1942]

**Blessed Herb Tea**—Dr. Lynch A. Johnson, Memphis, Tenn., Between Jan. 4 and Jan. 16, 1940. Composition: essentially plant material including couch grass, calamus and mistletoe. Misbranded because of false representation on label that it was a remedy for Bright's disease, bloody and scalding urine and stricture.—[D D N J F D C 369 March 1942]

**Colicramp Drops**—A. G. Groblewski & Company, Plymouth, Pa., Sept. 6, 1940. Composition: essentially alcohol, ether and small amounts of peppermint, ammonia, ginger and plant extracts. Misbranded because falsely labeled to relieve pains of stomach, gas, bloated feeling after eating and pains peculiar to women.—[D D N J F D C 379 March 1942]

**Colusa Natural Oil**—C. W. Colgrove, Hollywood, Calif., May 21, 1940. Composition: crude petroleum oil. Falsely represented on labels as an effective treatment of athlete's foot, ringworm, eczema, psoriasis, acne, poison oak, burns and cuts.—[D D N J F D C 380 March 1942]. A similar action against a shipment of Colusa Natural Oil by the Swan Manufacturing Company, San Francisco, was described under D D N J F D C 381 March 1942.

**Compound Herb Tea**—Dr. Lynch A. Johnson, Memphis, Tenn., Between Jan. 4 and Jan. 16, 1940. Composition: plant material such as rosemary, saffron, chicory, red clover, senna and green leaves resembling eupatorium. Misbranded because label falsely represented it as efficacious for treating gonorrhea and leucorrhea.—[D D N J F D C 369 March 1942]

**Double Quick Liver Tablets**—Dr. Lynch A. Johnson, Memphis, Tenn., Between Jan. 4 and Jan. 16, 1940. Composition: calomel and plant materials including ginger, senna, aloë, podophyllum and buckthorn. Misbranded because labels did not declare all active ingredients (particularly the calomel) and falsely represented product as exerting quick and strong action on the liver.—[D D N J F D C 369 March 1942]

**Durets**—James Lawrence Company, Inc., New York, May 25, 1940. Composition: in each tablet theophylline  $\frac{1}{2}$  grain, methenamine, 1 grain, sodium biphosphate, 2.3 grains and starch. Misbranded because label falsely represented the product to help drive out poisonous body wastes, relieve loss of sleep, help purify the urinary passages and be efficacious in treating backache, headache, mental depression, kidney and bladder disorders, pains in the groin, rheumatic muscular pains or joint rheas due to chronic prostatitis.—[D D N J F D C 382 March 1942]

**Edwenil**—Spicer & Company, Glendale, Calif., Between Feb. 21 and April 2, 1940. Composition: a colorless liquid containing about 1 per cent of solid chiefly sodium chloride with silicates and phosphates, nitrogenous matter and water. Adulterated and misbranded because represented to possess a strength and quality sufficient to activate and fortify the natural defenses of the body against acute and chronic endotoxic infections when administered in specified doses.—[D D N J F D C 60 March 1942]

**Herb Wash**—Dr. Lynch A. Johnson, Memphis, Tenn., Between Jan. 4 and Jan. 16, 1940. Composition: essentially ground oak bark. False representation on label that the nostrum was effective in treating female disorders, gonorrhea and falling of the womb, constituted misbranding.—[D D N J F D C 369 March 1942]

**Heron's Pure Eucalyptus Oil**—Norman C. Heron, trading as N. C. Heron Company, Los Angeles, Nov. 23, 1939. Adulterated because it contained not more than 68 per cent of eucalyptol, whereas the United States Pharmacopoeia provides that eucalyptus oil shall contain not less than 70 per cent of eucalyptol and because the difference between the two in strength, quality and purity was not plainly stated on the label. Misbranded because label falsely represented the product as a pure eucalyptus oil, as an all-around family remedy and as effective for internal or external use from the youngest to the oldest, that the article when used alone or in connection with Heron's Liver Regulator has no equal in treating Bright's disease and diabetes, whooping cough, diphtheria, pleurisy, pneumonia, fever, stomach and kidney disorders and many other things. This case was the subject of a criminal prosecution and the jury declared the defendant guilty. The court imposed a fine of \$300, suspended a prison sentence and placed the defendant on probation.—[D D N J F D C 345 March 1942]

**Hunt's (Dr.) Cervical Spine Relaxer**—Albert Thurlow Hunt, Los Angeles, Jan. 3, 1940. Device consisted of a sling fitting under the chin and around back of neck and riveted to a horizontal bar operated from a block and tackle, which were manipulated to cause a stretching of operator's neck. Misbranded because statements and designs in accompanying circular falsely represented the device as practically a cure all.—[D D N J F D C 372 March 1942]. A Post Office fraud order debarring this mechanism from the mails was reviewed in THE JOURNAL, Dec. 27, 1941, page 2269.

**Kru Lax**—Oriental Laboratory, St. Louis, May 22, 1940. Composition: epsom salt, sulfur and plant material including licorice, anise and buchu. Charge of misbranding was based on false label representation that the product was an oriental herbal compound which would relieve constipation and hence obviate a good many other disorders such as heartburn, arthritis, sciatica, lumbago, gout, prostate trouble, female weakness, tape worm, appendicitis and tuberculosis.—[D D N J F D C 384 March 1942]

**Marie de Medicis Scalp Food**—Marie de Medicis Products Company, Philadelphia, Sept. 30, 1940. Composition: a perfumed brown ointment containing free sulfur, hydrous wool fat and petrolatum. Misbranded because labels falsely represented that it would make the hair beautiful and healthy, nourish the scalp and be an effective treatment for dandruff, falling hair and various scalp ailments and because labels did not list the common name of each active ingredient.—[D D N J F D C 364 March 1942]

**Natural Mineral Extracts**—Colonial Drug Company, Tulsa, Okla., Feb. 13, 1940. Composition: essentially ferric sulfate and water with small amounts of aluminum, calcium and magnesium compounds. Falsely represented on label to maintain mineral balance, give new life and overcome infections and a long list of disorders such as those of the skin, kidneys, bladder, rectum and female organs.—[D D N J F D C 385 March 1942]

**Natural Ray Mineral Water**—Natural Ray Mineral Water Company, St. Louis, Aug. 11, 1939. Composition: a slightly alkaline water whose scant mineral content consisted chiefly of calcium bicarbonate, calcium sulfate and magnesium sulfate. Misbranded because falsely represented on label as an effective treatment of rheumatism, uric acid and kidney disorders.—[D D N J F D C 386 March 1942]

**Naturzelp**—Nutro Distributing Association, Columbiana, Ohio, Jan. 1, 1940. Composition: essentially epsom salt, sodium salicylate and plant extracts including licorice. Label falsely represented it as a general purifier acting directly on the liver and relieving rheumatism, arthritis, neuritis, lumbago, besides being a tonic for various organs and removing the sugar from the urine, thus eliminating the symptoms of diabetes.—[D D N J F D C 387 March 1942]

**Noes Graduated Exercisers and Massagers**—Roy H. Noe, Memphis, Tenn., May 22, 1940. Composition: two rubber belts, one equipped with handles accompanied by an instruction book and a circular. Falsely represented in the labeling to be the fastest, wustline-reducing exercise known to build health, eliminate constipation and prove efficacious for massaging the pelvic organs, keeping the prostate gland normal, correcting gland trouble, strengthening the eyes and doing a good many other things.—[D D N J F D C 390 March 1942]

**Par A Pac Reducing Pack**—Par A Pac Company, New York, May 21, 1940. Composition: belts or pads consisting of layers of parchment, flannel and rayon. False representations that reducing pack was efficacious for spot-reducing, eliminating excess flesh on the waistline, abdomen, hips, thighs, legs, arms or shoulders, oxidizing superfluous fatty tissues and slenderizing without dieting or exercise and that heating pad would relieve chest colds, lumbago, arthritis, backache and muscular soreness.—[D D N J F D C 396 March 1942]

**Vitawine**—Interstate Laboratories, Inc., Louisville, Ky., April 3, 1940. Composition: in each fluid ounce iron and ammonium citrate, 15.56 grains, manganese citrate, 0.63 grain, sodium citrate, 5.23 grains and alcohol, 14.48 per cent. Biological examination showed that it contained 500 international units of vitamin B<sub>1</sub> per fluid ounce. Misbranded because label falsely represented that the product would assist in renewing health, restoring energy, enriching the blood, increasing metabolism and promoting normal growth, that it contained blood and body-building ingredients was indicated in any form of anemia, was a health tonic and would help prevent pellagra, inflammation of the skin, diarrhea, mental and physical nervousness and certain types of neuritis and other things.—[D D N J F D C 394 March 1942]

### REQUESTS FOR REPRINTS

*To the Editor* —I fully support the statements made by Dr Richard Kovacs in his recent communication in *THE JOURNAL*. Very few physicians who ask for reprints enclose a stamped envelop with their request. However, there is an additional and more flagrant lack of courtesy. Many physicians write to ask for information on how to treat patients and data for papers they intend to write. My impression is that less than one in ten takes the trouble to thank us for the advice and information we give, even when we specifically ask to be told of the results of therapy we recommend. It seems to me that the least physicians can do is to say "thank you" for the time we spend thinking about their problems and preparing an answer.

J P GREENHILL, M D, Chicago

*To the Editor* —On page 828 of the July 4 issue, Dr Richard Kovacs condemns the practice of certain persons using a penny postcard to request a reprint. He believes that any one requesting a reprint of an author should write a personal letter and enclose postage.

I am not in accordance with his belief for the following reasons. I use my own funds to send out approximately eight hundred reprints of each of the articles I write, with the full knowledge that 90 per cent or more of these will receive no better than a casual glance before reaching the scrap basket, therefore, I feel that I can perfectly well afford to send reprints at my own expense to those who request them even by postcard.

Though no mention is made in Dr Kovacs's letter of acknowledging reprints, it is my belief that an acknowledgment is not required unless one or more of the following conditions prevail:

- 1 If the reprint is of genuine interest to the recipient
- 2 If the author is a close friend
- 3 If the author is a young doctor who has done a good piece of work and deserves encouragement

ROBERT B TAFT, M D, Charleston, S C

*To the Editor* —In *THE JOURNAL*, July 4, appears a short scathing discourse by Richard Kovacs, M D, concerning penny postcard requests for reprints. Dr Kovacs condemns this procedure and titles it as a "reprint racket."

According to his notations I suppose I should classify myself as one of the "penny postcard reprint racketeers"! Before doing this I wish to broach a few points in the defense of us "racketeers."

1 Use of the penny postcard affords a tremendous saving in paper, secretarial time and physician's time. All three are vital in these days, when a physician's time is more crowded than ever because of the shortage created by the war.

2 The physicians who request reprints are usually the ones who write scientific articles. They in turn spend funds for purchase of reprints and postage to supply requests for reprints. Therefore the outlay averages up in the long run.

3 The few dollars spent in distributing reprints for the edification of colleagues certainly will not break or even dent the purse of the physician author.

4 One doesn't request a reprint if one isn't especially interested in the subject with which the paper deals.

5 The average busy physician runs across titles of papers he would enjoy reading only at odd moments. These are found chiefly in the summaries and indexes of the Current Medical Literature printed in each issue of *THE JOURNAL*.

Because of this I, as well as many of my physician friends who do not have access to a large medical library of periodicals make a habit of having penny postcards handy. We put down requests for reprints at once and soon have the article at hand. Frequently, postponing the request until one arrives at the office the following day causes neglect in writing the reprint. Daily duties occupy the physician's mind, and the desire for the reprint is not recalled until a leisure moment at home again, and so on ad infinitum.

I for one feel greatly honored when requested for a reprint—maybe it is due to the particular type of ego I possess.

STANLEY H MACHT, M D, Crewe, Ia

### CONSTITUTIONAL INADEQUACY OR NEURASTHENIA

*To the Editor* —That was a fascinating article by Dr Walter C Alvarez in the July 4 issue. He always writes well and interestingly. Of course, all of us old practitioners recognize the class of patients to which the doctor chooses to apply a new label—constitutional inadequacy. Yes, we are all acquainted with that class of chronics who wander from office to office from clinic to clinic, and finally wind up with some quack or fall a prey to some patent nostrum.

It is with the new name, however, that I wish to take issue with the author. The label seems a bit vague, too long and hackneyed. If we can only find a simple label, of one word or of two words joined together for euphony!

I didn't have to go far. Under the heading of the Cause of the Trouble, Dr Alvarez states "Actually, in most cases it is sure the primary constitutional weakness is in the nervous system." Ah! I have it. Weakness and nervous system. Weak nerves—neurasthenia. What a discovery! And what a simple label. What you say, neurasthenia, that's an old name. Well, old or new, it fits it like a glove.

SAMUEL RALPH, M D, Brooklyn

### CARDIAC FAILURE AND RHYTHM OF THE HEART

*To the Editor* —A brief note appearing in *Tones and Notes* in *THE JOURNAL*, May 30, was entitled "Get Toned! Boys" (contributed by a "Colleague"). The contradiction in this title called attention to does have a serious as well as a more humorous aspect, and it is because of the former that I wish to publish this explanatory note. The contradiction referred to occurred in volume 4 of the *New Internist Clinics* (1941). On page 4 Keefer states that "the vast majority of patients with heart failure regardless of its cause have normal cardiac rhythm." On page 165 of the same volume Hallock, Larson and Watson state that "it is generally accepted that the majority of cases of cardiac failure are accompanied by auricular fibrillation." This statement was based on statistics of Mackenzie (1913) and Lewis (1937) with reference, however, to severe congestive heart failure. In a later sentence we were not thinking of the cases of auricular failure presenting with dyspnea alone and without signs of right heart failure, which are usually associated with the term "congestive failure." Of course, the statement made was incorrect in the broad sense because we did not specify congestive heart failure. We freely admit this and wish to take this opportunity of correcting it and of thanking the colleague who called the matter to our attention.

PHILIP HALLOCK, M D  
E A LARSON, M D  
C J WATSON, M D

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

**ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE**  
Chicago Feb 13-16 1943 Sec Council on Medical Education and Hospitals Dr H G Weiskotten 55 North Dearborn Street Chicago

### District of Columbia May Report

The District of Columbia Board of Examiners in Medicine and Osteopathy reports the written examination for medical licensure held at Washington May 11-12, 1942. The examination covered 9 subjects and included 60 questions. An average of 75 per cent was required to pass. Nineteen candidates were examined all of whom passed. Six physicians were licensed to practice medicine on endorsement of credentials of the National Board of Medical Examiners. The following schools were represented:

| School   | PASSED | Year Grad | Number Passed |
|--|--------|-----------|---------------|
| George Washington University School of Medicine (1941-19)* |        | (1940)    | 11            |
| Georgetown University School of Medicine                   |        | (1941-2)* | 2             |
| Indiana University School of Medicine                      |        | (1938)    | 1             |

### West Virginia March Report

The Public Health Council of West Virginia reports the oral and written examination for medical licensure held at Charleston, March 2-4, 1942. The examination covered 11 subjects and included 110 questions. An average of 80 per cent was required to pass. Four candidates were examined, all of whom passed. Eleven physicians were licensed to practice medicine by reciprocity. The following schools were represented:

| School   | PASSED | Year Grad | Number Passed |
|--|--------|-----------|---------------|
| George Washington University School of Medicine        |        | (1939)    | 1             |
| Western Reserve University School of Medicine          |        | (1916)    | 1             |
| Hahnemann Medical College and Hospital of Philadelphia |        | (1940)    | 1             |
| Meharry Medical College                                |        | (1940)    | 1             |

| School   | LICENSED BY RECIPROCITY | Year Grad | Reciprocity with |
|--|-------------------------|-----------|------------------|
| George Washington University School of Medicine                                  |                         | (1939)    | Vermont          |
| Rush Medical College   |                         | (1935)    | Penna            |

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Hospitals Liability for Death of Mentally Depressed Patient, Practice of Medicine by Hospitals**—The administratrix of the estate of the deceased patient sued the defendant sanatorium, the defendant physician and another for damages because of the patient's death. At the close of the plaintiff's evidence, the defendants moved the court for a directed verdict, which motion was sustained, and the jury was instructed to and did return a verdict for all the defendants. The plaintiff then appealed to the Appellate Court of Indiana, in banc. After the filing of the plaintiff's brief, the action against the defendant physician was dismissed.

The evidence showed that the patient was taken to the defendant sanatorium because he was suffering from mental depression and had twice attempted to commit suicide. When he arrived at the institution he was examined by the defendant physician, who was a resident physician at the sanatorium but who also engaged in the private practice of neurology and psychiatry. Arrangements were made for the constant guarding of the patient, and his attendant, who was on twenty-one hour duty, was informed that the patient had suicidal tendencies and that he must watch him closely. Several days after admission, at the direction of the head nurse of the sanatorium, the attendant took the patient to an office building for the purpose of having roentgenograms made. The office to which the patient was taken was located on the seventh floor of the building. While in that office, the patient suddenly jumped through a large open window and fell to the sidewalk below, the fall causing his death.

The defendant sanatorium was a private corporation operating for profit, and such a corporation, the court said, is liable in damages for injuries to its patients proximately resulting from the negligence of its officers or employees while performing administrative or ministerial acts. While a hospital or sanatorium conducted for private gain is not an insurer of its patients against self-inflicted injuries, it is required to use ordinary care. In determining what constitutes ordinary care in such cases it is proper to consider the physical and mental ailments of the patient which may affect his ability to look after his own safety. The attending physician in this case testified that the patient was his private patient, and the court thought that the evidence justified the conclusion that the patient was under the charge of this physician as an independent contractor for diagnosis and treatment of his mental condition but that he was under the charge of the sanatorium for care, protection and the customary hospitalization of an institution which treats mental and nervous disorders. The plaintiff contended that, since the physician gave an order to the head nurse of the sanatorium that the patient be taken to the office building for roentgenograms, the protection and guarding of the patient while he was in the office building and the act of the head nurse of the hospital in directing that he be taken to such a place under the charge of one attendant were all medical acts connected with the treatment of the patient by the physician and that the sanatorium or its attendant could not be liable for any negligence in the performance thereof.

When a physician, the court said, is in charge of all the medical or surgical work carried on at a hospital or sanatorium and gives orders or directions concerning the treatment of patients, it is difficult to determine when the acts of the employees of the hospital or sanatorium are medical acts assisting the physician in the treatment of his patient or administrative or ministerial acts of the hospital itself in carrying out its contract with the patient. In Indiana, the court continued, where a sanatorium or hospital has no right to engage in the practice of medicine and where physicians although employed by it cannot engage in the practice of medi-

cine as its agents, it is apparent that many anomalous situations will arise if the customary and routine acts of the hospital employees are designated as medical acts instead of administrative or ministerial acts of the hospital or sanatorium. A private hospital or sanatorium operated for profit and holding it out to the public as equipped to furnish hospital service should be liable, in the opinion of the court, for the negligent acts of its employees who are acting under its supervision and control in the performance of their routine duties. If the negligence resulting in injury to a patient was in fact that of an independent physician, the hospital in which the patient was treated not and should not be liable. In determining whether the negligence was the negligence of the hospital or sanatorium or of the physician who was treating the patient, the nature of the act performed and whether it was performed by a servant of the hospital or sanatorium or a servant of the physician should be of value in reaching a correct determination. A directed verdict to have a roentgenogram made, the court continued, is not a medical act that would cause the person giving the order to be guilty of the offense of practicing medicine without a license. The guarding and protecting of patients suffering from mental disease is not a medical act, and it is not necessary to have a license to practice medicine to perform such acts. The fact that a physician directs or orders such an act does not make it a medical act. The physician in this case was an administrative officer of the sanatorium as well as engaged in the practice of medicine. The court could see no reason why he, as an officer of the sanatorium, could not direct the performance of routine duties by its employees, and the fact that he was a physician or that the duties were connected with the care of a private patient would not necessarily make the acts of the employees medical acts.

In conclusion, the court said that the evidence was such that the minds of reasonable men could differ as to whether under all conditions and circumstances it was negligent to send the patient to the office building with only one guard, especially when there were a number of open windows in the office building and when conditions were such that the patient might be injured in attempting to escape. Also, the minds of reasonable persons could differ as to whether the attendant and the employer took proper precautions for guarding the patient while he was in the office building. The trial court, in the opinion of the Appellate Court, erred in taking the case from the jury at the close of the plaintiff's evidence and in directing a verdict for the defendants. The judgment was therefore reversed with direction to the trial court to sustain the motion for a new trial against the sanatorium and the attendant.—*Forester v. North Sanatorium*, 42 N. E. (2d) 415 (Ind., 1942).

**Malpractice Production of Hospital Records Relating to Medical Treatment Required for Patient's Inspection**—One Garrett brought an action in the Iowa courts for damages against the defendant clinic and the defendant physicians for malpractice. Subsequently, the trial court by application of an Iowa statute which authorizes a trial court to require production of any books or papers which are material to the just determination of any cause pending before it in which books or papers are under the control of the party to whom the rule is sought, entered a rule requiring the hospital wherein the defendants had treated the plaintiff to produce the charts and records relating to their treatment of the plaintiff in the hospital. The defendants sought by appropriate action in the Supreme Court of Iowa to test the validity of the rule.

Whether a rule for the production, said the Supreme Court, of hospital records will be entered rests in the discretion of the trial court. The statute providing for the production of books and papers in this connection should be liberally construed. The physician does not seriously claim that the hospital records and charts are material competent evidence for the plaintiff's case. He contends, however, that the patient's request for production of those records and charts is in effect a roving commission to ransack the entire files of the defendant physician.

hospital in question to determine whether or not the patient has a cause of action or to discover the defense of the physicians in the malpractice suit. It is quite manifest, however, that the plaintiff was not merely engaged in a fishing expedition in that the hospital records and charts will show the orders of the defendant physicians given in their medical treatment of the patient and what was done pursuant to the orders by the hospital staff and will tend to prove acts of commission or omission by the physicians during the time the relation of physician and patient existed. It is well settled that the fact that the documents may be evidence for the patient will not defeat the patient's right to their production if they tend to prove his cause of action.

The physicians next contended that the trial court erred in granting the inspection of the hospital records and charts because the hospital was not a party to the malpractice suit and the records and charts were in the possession and control of the hospital. We are satisfied, answered the court, however, that the trial court was right in deciding that the charts and records pertaining to the patient were under the control of the defendant physicians. The records show that the physicians were entitled to possession of the records pertaining to the patient's case from the hospital on request and that the hospital would not release or deliver them to third parties without the consent of the physicians. Actual possession of books and papers is not necessary. It is sufficient that those books and papers are under the control of the parties against whom the rule for production is sought. Since it satisfactorily appeared to the court that there was competent evidence in the control of the physician's material and necessary to the patient's action, the Supreme Court concluded that the trial court had not erred in entering the rule requiring the production of the hospital records and charts.—*Haughton Clinic v. District Court of Franklin County*, 300 N. W. 646 (Iowa 1941).

**Accident Insurance Death Following Unintended Intravenous Injection of Arsenical Compound by Physician as Due to "External, Violent, and Accidental Means"**—The defendant insurance company issued a policy providing certain benefits if the insured should die from "bodily injuries effected directly and independent of all other causes and solely through external violent and accidental means." The insured was treated by a physician for a severe cold or bronchitis. Shortly after his recovery from that ailment his physician for just what purpose the case does not make clear, while intending to give him an intravenous injection of a nonpoisonous drug, through inadvertence injected an arsenical compound, resulting, according to the reported case, in instant death. When the beneficiary brought suit on the policy, the insurance company denied liability. The trial court in effect dismissed the suit and the beneficiary appealed to the court of appeals of Ohio, Cuyahoga County.

The insurance company contended that death had not been caused by external violent and accidental means, within the meaning of the policy because first the force causing death was not an external force and second the drug was administered by the physician in his professional capacity in attempting to treat the insured and therefore the taking of such poison under the circumstances was voluntary on the assured's part and did not come about by accident. Thus the insurance company claimed there was an accident involved in the facts stated, such accident concerned the death itself and not the cause which brought about the death. As to the first question answered the appellate court the courts have without deviation held that death caused by the administering of poison into the system of a human being is in fact a death caused by the use of external violence and force. Although there are no cases in Ohio directly in point a close analogy is found in *United States Mutual Accident Ins. v. Hubbell*, 56 Ohio St. 516, 47 N. E. 544 which held that death caused by accidental drowning is death through external violent, and accidental means, within the meaning of a policy similar to the one here involved. Perhaps an analogy coming even closer to the facts in this case are cases in which death is caused directly and independently of

all other causes by the inhalation of poisonous gas, in which case according to 5 *Couch on Insurance*, 4038, section 1150.

Death or injury by the inhalation of poisonous or irrespirable gases without design intent or expectation on the part of the insured—that is through accident—is by external violent and accidental means, since the gas is external the result is unnatural and the cause is violent.

It seemed to the court from the plain facts of the case that the physician purely by accident and inadvertence, injected into the body of the insured a deadly poison when he thought he was using a nonpoisonous drug and that there was no question that the death was caused by accident or resulted from accidental means.

The court accordingly held that the trial court had been in error in dismissing the action reversed the judgment of dismissal and remanded the cause for further proceedings.—*Mulloff v. National Accident & Health Ins. Co.*, 37 N. E. (2d) 217 (Ohio 1941).

**Compensation of Physicians Liability of Employer in Common Law Action to Recover for Medical Services Rendered Employee**—In Indiana said the Supreme Court of Indiana, a physician who, pursuant to a contract with an employer renders medical services to a workman injured in the course of his employment may enforce his claim against the employer for the payment of his fees in a court of law, independently of any proceedings instituted under the Indiana workmen's compensation act before the industrial board. No provision in the act purports to take this right away from the physician. The act neither vests in the industrial board exclusive jurisdiction to fix fees for all medical services rendered an injured employee nor limits the recovery by the physician to a proceeding before the board. If an employer hires a physician, it is simply a matter of contract between the physician and the employer. If the amount to be paid is stipulated, the physician is entitled to that sum. If no amount is named, the physician is entitled to receive the reasonable value of his services as determined by the court and a failure to pay gives rise to a common law action that may be prosecuted in the courts.—*Hoffman v. Brooks Const. Co.*, 41 N. E. (2d) 613 (Ind. 1942).

**Optometry Practice Acts Information Not Stating Name of Person on Whom Unlicensed Defendant Allegedly Practiced Optometry Defective**—An information said the court of criminal appeals of Texas, that charges the defendant with practicing optometry without having first registered his license to practice as required by law must allege, or satisfactorily account for failure to allege the name of the person on whom the defendant allegedly practiced optometry. An information lacking in that essential is fatally defective.—*Blunberg v. State*, 161 S. W. (2d) 1082 (Texas 1942).

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

Is the Beneficial Effect of Urine Extracts on Mann-Williamson Ulcers Due to Gastric Secretory Depressant in Urine? D. J. Sandweiss and M. H. F. Friedman, Detroit—p 166

On Explanation of the Urobilinuria Present in Cases of Hematoma and New View on Origin of Urobilinogen from Bile Pigment. J. W. G. Ten Bokkel Hinnink, Tiel, Holland—p 168

Prolongation of Survival Time in Mann-Williamson Dogs by Supplementing Diets with Amino Acids. D. Shock and S. J. Fogelson, Chicago—p 173

\*Acute and Chronic Cecal Volvulus. D. C. Browne and G. McHardy, New Orleans—p 177

**Bleeding Peptic Ulcer.**—In 744 cases of peptic ulcer studied by Churkin and Tannenbaum, bleeding occurred in 101 cases, an incidence of 13 per cent. In 86 cases of bleeding peptic ulcer the treatment was medical, and in 15 it was surgical. The surgical cases are not considered in this study. The peak of incidence of bleeding peptic ulcer occurred in the third and fourth decades. Fifty-six patients with bleeding ulcer were treated by supportive measures and starvation with a mortality of 6.9 per cent. Among 30 patients receiving the Meulengracht regimen there was one death from a perforation. The feeding treatment appears to have lowered the mortality. It also shortened the average stay in the hospital from thirty-eight to twenty-eight days.

**Acute and Chronic Cecal Volvulus.**—According to Browne and McHardy, acute intestinal obstruction due to cecal volvulus is infrequent, for few such instances escape confirmatory surgery or autopsy. They add 6 illustrative case reports of acute intestinal obstruction due to cecal volvulus to the limited literature on the subject, 3 of the cases were post-operative. Their statistical study reveals an incidence of only

14 per cent among 411 cases of acute intestinal obstruction. A clinical diagnosis of acute cecal volvulus is seldom made since there are no diagnostic criteria that render a clinical diagnosis feasible. Cecal volvulus must be considered in other cases of intestinal obstruction. A mobile cecum probably can exist without clinical manifestations, because this anatomical abnormal condition is present in about 24 per cent of persons. It is likely that many an unexplained abdominal complaint due to an unrecognized chronic cecal volvulus, certain degrees of torsion permitting spontaneous rectification. Chronic recurring volvulus results in obstructive manifestations of variable severity with colicky right abdominal pain. Perhaps the therapeutic response to the removal of many a chronic appendix may be due to the resultant cecal fixation. In view of the high mortality in the acute obstructive cases it seems practical to advise cecopexy if a diagnosis of subacute or chronic cecal volvulus is made.

**Reticuloendothelial Hyperplasias of Bone.**—Gross and Jacob state that of the various lesions under discussion of Hand-Christian's disease are the most common. Nevertheless, even the latter is so infrequently encountered that the average pathologist has little familiarity with it. It is surprising to find that this disease has been diagnosed with osteitis fibrosa, syphilitic osteitis, carcinoma, sarcoma and multiple myeloma. On the other hand, the literature contains comments which imply considerable confidence in ability to make at the correct diagnosis. Knowledge of the disease, reticuloendothelial proliferations, whether focal as in eosinophilic granuloma or solitary xanthoma, or more general as in Hand-Christian's disease or Letterer-Siwe's disease, is from complete. Biopsies should therefore be encouraged rather than discouraged. The similarity in histopathologic features of eosinophilic granuloma on the one hand and solitary xanthoma as well as Hand-Christian's disease, on the other, and warrants placing these conditions in the same case group. There does not seem to be any obvious roentgenographic or pathologic feature nor other information at present regarding any one of these lesions which their dogmatic segregation into separate diseases, and the existence of cases with features intermediate between Hand-Christian's disease and Letterer-Siwe's disease (reticuloendotheliosis) raises the question.

a sharp distinction between the lipid and the nonlipid reticuloendotheliosis is valid. Three case reports are presented which illustrate the variations in degree, stage of involvement and localization of reticuloendotheliosis.

**Activated Sterols and Calcium Salts in Parathyroid Tetany.**—Svingen states that large doses of vitamin D may serve to control in parathyroid tetany serum calcium and phosphorus levels adequately but that at current prices this entails an increase in cost to the patient of two to six times that required for similar success with the use of dihydrocholesterol. A detail in the management of the patient with chronic tetany is the choice of calcium salt for use in addition to the small calcium content of the low phosphorus diets. Calcium lactate has been used most widely. Calcium gluconate was advocated because of its solubility, ease of absorption and slightly sweet taste. Calcium phosphate is often prescribed although the rationale of adding phosphate is incorrect and in spite of the known fact that phosphates in the intestinal tract will reduce the absorption of calcium when the reaction is not acid. The optimal calcium salt is calcium chloride because this salt is very soluble in water and tends to produce a slightly acid reaction favoring absorption and because it furnishes the largest proportion of calcium per gram of salt. The chloride is four times as effective as the gluconate and twice as effective as the lactate when serving as a source of calcium. The chief drawback to its use in oral preparations has been its highly astringent effect in the mouth and pharynx. This can be masked satisfactorily by prescribing the chloride as a 25 per cent solution in a vehicle such as the standard elixir or syrup of glycyrrhiza.

**Serous Adenofibromas and Cystadenofibromas of the Ovary.**—Scott reports 14 cases of serous adenofibroma and cystadenofibroma of the ovary. These tumors correspond to the typical fibroma ovarii adenocysticum of Frankl-Wolfe's case in 1927 is the only 1 previously reported in English literature. The tumors were made up of two component parts, a dense connective tissue matrix in which were embedded numerous small cystic spaces lined by compact single layered cuboidal or low columnar, often ciliated epithelium. Psammoma bodies and papillary tendencies were frequent. The tumors were firm and solid with minute cystic spaces (adenofibromas) or partially cystic with at least one fourth of the mass solid (cystadenofibromas). In 2 cases the neoplasm was bilateral and in 3

the neoplasm was an incidental laboratory finding. There was no constant associated pelvic disorder of significance, although uterine myomas were found in 6 cases. Pain was the most common presenting complaint in 9 instances, and in 6 of these it could be definitely related to pressure by the tumor. No endocrinologic importance could be attached to these tumors. Five cases of abnormal vaginal bleeding were adequately explained by associated pelvic pathologic conditions. The most striking clinical feature was the age of the patients. In a total of 31 patients with tumors of this distinct group collected from the literature and including this series, 29 (93.5 per cent) were 40 years of age or over and 20 (64.5 per cent) were 50 years or over. Malignancy was not observed in spite of the fact that the potentialities in this respect would appear to be as great as in the serous cystadenomas and the fibromas. It is suggested that these tumors be classified as a special type of epithelial tumor of the ovary under the subhead of serous cystadenoma as previously suggested by Taylor.

**Polyneuritis in Pregnancy Due to Vitamin B Deficiency.**—In 1932 McGoogan reported 5 cases of severe polyneuritis following pernicious vomiting of pregnancy. Since that time 15 additional cases have been observed. Studies by a number of investigators have demonstrated that the condition is caused by vitamin B deficiency. The severe cases of polyneuritis develop early in pregnancy and are usually preceded by pernicious vomiting. The deficiency of vitamin B<sub>1</sub> in pernicious vomiting is brought about by a lack of food intake by a failure of retention of food ingested and by a high carbohydrate diet accompanied by administration of large amounts of dextrose. The usual history is one of vomiting, of attempts at high carbohydrate ingestion and the administration of dextrose with or without improvement and the onset of peripheral neuritis. The first symptoms are those of a generalized weakness, pain in the calves, numbness, tingling of the hands and feet and inability to walk. There is atrophy of muscles and skin and diminished or absent reflexes in the involved area. Retention of urine or incontinence with overflow, constipation, paralysis of the abdominal muscles, paralysis of the accessory muscles of the chest and involvement of the bulbar area with diaphragmatic paralysis, tachycardia, difficulty in phonation and deglutition occur in the order mentioned. Mental confusion of the Korsakoff type is frequently present. The author presents the clinical histories of 15 cases. The frequency of ocular symptoms is noteworthy (26.6 per cent). The author reviews 130 cases of severe polyneuritis from the literature, thus bringing the total to 145. Of these, 40 were treated with varying amounts and varying fractions of the vitamin B complex. In the total series there were 40 deaths, or a mortality of 27.5 per cent. Thirty-seven of the deaths occurred in the 105 patients receiving no vitamin B complex, an incidence of 35.2 per cent, while only 3 of the 40 patients receiving vitamin B complex died, an incidence of 7.5 per cent. From 50 to 100 mg of thiamine hydrochloride should be given daily in polyneuritis. Therapeutic abortion is definitely contraindicated and if done increases the mortality rate. Ultimate recovery is slow under the best of therapy and may require fifteen to eighteen months.

**Death in Surgical Treatment of Tuberculosis**—The group of thoracoplasties reviewed by Ritterhoff includes 181 patients subjected to 408 operations. There were 21 deaths, of which 16 were early ones. Necropsies were performed on 9 of the 16 patients who died within one month following operation. These necropsies suggest that a variety of factors may be operative in the early fatalities following thoracoplasty. This is in keeping with the principle that injury to one of a group of systems anatomically and physiologically related is reflected by departures from normal in related systems. This variety of factors is particularly conspicuous in the second group of cases, in which right cardiac hypertrophy, cardiac dilatation, changes suggestive of alkalosis and fat embolism were prominent. The presence of fat embolism and focal ulcerative esophagitis and duodenitis emphasizes that, even with present surgical technique, thoracoplasty is still attended by considerable trauma. This is particularly true in revision procedures, which are usually more extensive than the primary operation. Altered thoracic aerodynamics, induced either by paradoxical respiration or by increased pulmonary circulation pressure, may result in alkalosis and tissue anoxemia. Contralateral tuberculous bronchopneumonia may result from aspiration of an empyema by way of a bronchopleural fistula or from blood stream distribution of infectious material. This complication, which is thought to be a frequent cause of death, was significant in only 2 cases.

**Endobronchial Tuberculosis and Reexpansion or Atelectasis**—Brantigan and his collaborators point out that the increasing use of bronchoscopy for tuberculous patients has revealed a significant percentage of pulmonary lesions to be complicated by endobronchial lesions. These lesions influence the course of the parenchymal disease. In the presence of an endobronchial lesion a closed pneumonolysis may be followed either by the creation of a check valve mechanism resulting in rapid reexpansion of the lung or by a complete occlusion resulting in atelectasis. The authors encountered 4 patients in whom closed pneumonolysis was followed by rapid reexpansion and obliteration of the pneumothorax space. Fluoroscopic examinations were performed three hours after the completion of the pneumonolysis, at which time almost complete reexpansion was observed. Subcutaneous emphysema was evident. Pneumothorax refills were immediately administered and repeated within four hours. The following morning complete reexpansion had occurred in 1 case, the upper and middle lobes had reexpanded

in the other 3 cases, but there was a partial collapse of the lower lobe. Along with the frequent refills there was an increasing subcutaneous emphysema. The accepted explanation for the failure of the pneumothorax space following a closed pneumonolysis is excessive leakage of air through the wounds made by the thoracoscopic instruments. The authors do not consider leakage of air per se as the cause of reexpansion of the lung. It is the mere escape of air through the puncture wounds were the cause of loss of the pneumothorax space, it should occur in all cases but does not. The presence of an endobronchial lesion in the main stem bronchus, at the orifice of the branch bronchus within the lumen of the branch bronchus explains the rapid loss of air, and subcutaneous emphysema is the result of the reexpanded lung and not the cause. Subsequent bronchoscopy in all 4 cases revealed endobronchial lesions at the orifices of the branch bronchi which had caused partial obstruction. The authors present a case history which illustrates the rapid reexpansion following a closed pneumonolysis. They admit that it is not frequent. When it does occur it offers a problem in prompt treatment, since in the case of reexpansion a successful pneumothorax is lost and in the case of atelectasis the problem of the unexpandable lung will arise. Routine bronchoscopy before the pneumonolysis is performed with local treatment of the endobronchial lesion is the procedure of choice. Lateral and/or tenacious secretions may institute the same sequence of events as does a frank endobronchial lesion.

**Deficiency and Requirement of Thiamine**—Williams and his collaborators found in a previous study that restriction of thiamine was associated with irritability, apathy, serious derangement of metabolic processes, loss of weight and prostration. In the present study moderate, prolonged restriction of this vitamin, but not of food calories, was associated with states of emotional instability reflected by irritability, moodiness, quarrelsomeness, lack of cooperation, vague progression to agitation, mental depression, variable restriction of activity and numerous somatic symptoms. Detectable metabolic disturbances occurring irregularly were of variable degree of severity and were reflected in disturbance of function of various tissues of the body. In all cases of induced deficiency of thiamine, mental and physical inefficiency preceded by one or months other more objective manifestation. In previously reported studies persons maintained themselves for one hundred and forty-seven days on intakes of thiamine less than 0.07 mg for each thousand calories of the diet, lost weight and strength. In the present study persons maintained their weight on an intake of 0.22 mg for each thousand calories, but their physical and mental efficiency and degree of well-being was greatly improved when 0.5 mg of hydrochloride was provided with this number of calories. The data indicate that for persons in this study the minimum requirement of thiamine was between 0.22 and 0.5 mg for each thousand calories of a diet providing carbohydrate and fat in conventional proportions. The data also indicate that

the optimal intake was not less than 0.5 mg or more than 1.0 mg for each thousand calories of such a diet. Individual variations dependent on differences in the rate of metabolic exchanges of energy or material as well as on environmental factors, activity, diet and intestinal absorption, must receive consideration when the requirement of thiamine of the individual person is judged.

**Neosarsphenamine in Bacterial Infections**—Osgood points out that neosarsphenamine has received little attention as a chemotherapeutic agent against infection other than syphilis. Marrow culture technique permits controlled quantitative studies of the effectiveness of chemotherapeutic agents against bacterial infections in the presence of living human cells. Neosarsphenamine was proved by this method to be highly effective against staphylococci and certain groups of *Streptococcus viridans* (alpha streptococcus). Neosarsphenamine has to be present for an appreciable period from forty-eight to seventy-two hours or longer, in order to insure maximum effect. The author has made more than a hundred marrow culture experiments. Neosarsphenamine in concentrations which do not kill living human cells is effective against some strains of *Strep. viridans*, most staphylococci and some other bacteria. The effective concentration can be maintained clinically. A few patients with staphylococcal bacteremia treated with neosarsphenamine have recovered. Several patients with subacute bacterial endocarditis so treated were free from symptoms for eight to sixteen months but more patients must be followed for two years or longer before final appraisal is justified. The therapy involves risk of toxicity and should be used only in cases of serious infection and under careful supervision. Neosarsphenamine plus sulfathiazole may be more effective against certain bacteria than either alone. Of 34 unselected patients with bacterial endocarditis 4 remained free from symptoms and 12 had temporary clinical improvement with return to normal temperature. No patient treated only with drugs of the sulfonamide group showed more than temporary improvement. It is recommended that neosarsphenamine therapy be not discontinued before twenty-five days, even though there is no earlier clinical evidence of benefit. The author is now giving 100 mg of ascorbic acid and 40 mg of thiamine hydrochloride daily during neosarsphenamine therapy with the hope of decreasing toxicity. It is also thought advisable not to discontinue neosarsphenamine for mild polyneuritis or dermatitis.

**Electroencephalographic Studies on Neurosyphilis**—The report by Finley and his associates is a preliminary analysis of electroencephalographic records obtained during the past two and one-half years on 175 patients from the neurosyphilis clinic of the Boston Psychopathic Hospital. The records were obtained

with a six channel ink writing oscillograph of the Grass type. In 124 the condition was diagnosed as dementia paralytica, in 20 as tabes dorsalis, in 11 as juvenile dementia paralytica, in 8 as optic nerve atrophy and in 12 as meningovascular neurosyphilis. The tracings are compared with records from 215 normal controls. Normal electroencephalographic tracings were found for 19 per cent of the patients (treated and untreated) and for 70 per cent of the controls. Borderline records were found for 28 per cent of the patients and for 23 per cent of the controls. Abnormal records were found for 53 per cent of the patients and for 7 per cent of the controls. Abnormal electroencephalographic tracings were as common among patients with pure tabes and those with optic nerve atrophy as among patients with dementia paralytica. The records of 73 untreated patients with dementia paralytica showed a higher percentage of borderline and abnormal patterns than the records of 63 patients who had received treatment for nine months or more. No characteristic electroencephalographic pattern was found to be associated with neurosyphilis. This indicates its insignificant diagnostic value. The 73 untreated patients with dementia paralytica presented a degree of abnormality in the electroencephalogram which corresponded roughly with the clinical severity of the disease. Follow-up electroencephalographic records on patients undergoing treatment with clinical improvement often showed concurrent improvement in the electroencephalographic tracings. Electroencephalograms with abnormally slow high voltage cycles were more likely to be found among patients with dementia paralytica who showed confusion, disorientation and profound memory loss, while rapid cycles were more common among those with euphoria or other mood disturbances and paranoid ideas without the aforementioned signs. Slow cycles indicated more serious cerebral dysfunction than did rapid cycles. The majority of abnormal patterns were similar from homologous areas of the two hemispheres. This observation together with the fact that abnormal records were as frequent in cases of pure tabes and optic nerve atrophy suggests that lesions in or near the upper portion of the midbrain and the diencephalon may have more to do with the abnormal cortical electrical potentials than the cortical lesions.

**Periarteritis Nodosa**—Malamud and Foster show that there is little information available on the involvement of the central nervous system in periarteritis nodosa. They report a case presenting multiple neurologic changes and compare their observations with those in similar cases in the literature. They emphasize that involvement of the central nervous system is not uncommon in periarteritis nodosa. Pathogenically the condition is regarded as panarteritis and the parenchymal changes as of vascular origin.

**Otorhinogenic Meningitis**—Burman and his associates review 160 consecutive cases of meningitis and show a 60 per cent rate of cure in cases of otogenic and a 33 per cent rate in cases of rhinogenic meningitis. In bacterial meningitis in which

no other focus is apparent the infection should be suspected as emanating from the ear, nose or throat. The reviewed series shows that 36.2 per cent of all meningitides are of otorhinogenic origin. The incidence is probably higher, since necropsy occasionally reveals an unsuspected pathologic condition in these areas, with no other demonstrable cause. Because the sulfonamide derivatives obscure the clinical features and cause changes in the blood and in the roentgenogram, it is advisable to perform the diagnostic tests before instituting chemotherapy. The authors observed 3 cases in which no suppuration could be determined and in which the drum membrane looked normal, there was only the vaguest history of aural trouble, and yet on operation a completely broken down mastoid was revealed. Although cures have been reported from chemotherapy alone, best results have been obtained with the combination of surgical treatment, chemotherapy and administration of serum in properly selected cases. The drainage of a demonstrable or suspected focus is an accepted surgical principle. It is not safe to exaggerate the efficiency of the sulfonamides to the point of considering surgical intervention unnecessary. Operation should be carried out in every case of meningeal disease in which otologic or rhinologic involvement is suspected. The authors feel that intranasal operation on sinuses in meningitis is not as satisfactory as the external approach. They have adopted the so-called radical ethmoidophenofrontal sinus operation whenever these sinuses are involved. Subsequent to this series the authors filled the mastoid cavity with sulfamidamide powder and closed the mastoid wound. They have not attempted to do this in cases with sinus involvement. The efficacy of drug therapy depends largely on the extent of pneumatization of the mastoid, and this accounts for its relative inefficiency in the well ventilated accessory nasal sinuses, the air cavities permitting collection of infected exudate. With so many cases of recovery from meningitis one must guard against presuming that the cure was effected by chemotherapy alone. When there is bone necrosis, abscess formation or pooling of purulent material in air cavities, the sulfonamide derivatives will be ineffective unless the diseased areas are surgically evacuated.

**Negri Body in Rabies**—According to Johnson, Negri bodies cannot always be found in man and animals dying of rabies. It is necessary to resort to animal inoculation when the microscopic examination of a brain specimen is negative. All brain specimens received at the Georgia State Health Department in 1937 for the diagnosis of rabies were examined microscopically, and those found negative were studied by mouse inoculation. Of the 771 specimens found positive for rabies, 105 per cent were Negri negative. In an epizootic of fox rabies 10 brain specimens were positive for rabies by mouse inoculation and 94 per cent of these were microscopically negative. An analysis of 92 mouse positive brain specimens obtained in Alabama from dogs that had been vaccinated one month to a year before the onset of rabies demonstrated that 14 per cent were Negri negative. When dogs were experimentally infected with rabies by intramuscular inoculation, 39.7 per cent of the animals were negative by microscopic examination. Forty per cent of the dogs developing rabies were vicious at some time during the course of the disease. Only 21.4 per cent of these were Negri negative as compared with 52 per cent of dogs with paralytic rabies. This partially explains the discrepancy between the Negri findings in natural and experimental rabies, as the majority of routine specimens are from and biting dogs. The duration of symptoms before death is correlated to the absence or abundance of Negri bodies. Vaccinated dogs dying of rabies exhibited the same clinical picture as unvaccinated controls, and the error in microscopic examination was approximately the same in the two groups. It is suggested that rabies street virus is altered in either its manner and site of multiplication during epizootics or during the incubation period, and at this time a higher proportion of the microscopically negative dogs will be Negri negative. The rapid microscopical method of Sellers is recommended. The indications for inoculation of brain specimens are enumerated and the mouse is recommended for the purpose.

**Sulfathiazole in Pneumococcal Meningitis**—Cooper and his co workers say that because the sulfathiazole content of the brain and cerebrospinal fluid is low compared to that of the blood during medication it has been claimed that sulfathiazole is of little or no value in bacterial meningitis The experimental data presented and the clinical cases collected from the literature show that the statement requires modification The authors stipulate that 1 Sulfanilamide sulfapyridine, sulfathiazole and sulfamethylthiazole are equally effective in the treatment of experimental type 2 (Binda) pneumococcal meningitis in rats 2 The sulfathiazole content of the brains of rats which received 300 mg of sulfathiazole orally in twenty-

four hours averaged 1.6 mg per hundred grams at the time the blood average was 5 to 6 mg per hundred cubic centimeters 3 Clinical pneumococcal meningitis has been successfully treated with sulfanilamide as well as with sulfapyridine 4 Other clinical data show recoveries from pneumococcal, streptococcal, staphylococcal and meningococcal meningitis, which were attributed to sulfathiazole therapy in spite of the generally recognized low concentration of this drug in the cerebrospinal fluid 5 Because of lack of decisive data at present it is not possible to judge which of the sulfonamide drugs is significantly superior in the clinical treatment of pneumococcal meningitis

**Sulfonamides in Gonorrheal Urethritis in the Male**—According to LaTowsky and his collaborators sulfanilamide is no longer indicated in gonococcal infections since the later sulfonamides have been introduced The sulfonamide derivatives sulfapyridine, sulfathiazole and sulfadiazine have been found to be effective in the treatment of gonorrheal urethritis in the male Of 199 patients who presented themselves for treatment at the genitourinary clinic of the Philadelphia General Hospital

during the years 1939 to 1941, 167 were followed to the completion of the study. Ninety-three and five-tenths per cent of these were cured. The rate of cure was 92 per cent for sulfapyridine, 96 per cent for sulfathiazole and 93 per cent for sulfadiazine. The average dose required was 23.5 Gm for sulfapyridine, 28 Gm for sulfathiazole and 17.5 Gm for sulfadiazine in eight days. Toxic reactions occurred in 75 per cent of cases treated with sulfapyridine, in 11.5 per cent with sulfathiazole and in 8.8 per cent with sulfadiazine. The average time for the discharge to disappear was three days with sulfapyridine, three days with sulfathiazole and four days with sulfadiazine. The average time for a bacteriologic cure based on the appearance of the first negative culture of the prostatic fluid was fifty-one days for sulfapyridine, twenty-eight days for sulfathiazole and thirteen days for sulfadiazine. The "carrier state" so called (the period from the disappearance of symptoms to the last culture of the prostatic fluid known to contain living gonococci) averaged seventeen days for sulfapyridine, seventeen days for sulfathiazole and three days for sulfadiazine. The criteria of cure in this study were strict and included as the final provocative test two or more negative smears and cultures of the prostatic fluid. Sulfadiazine is a valuable drug in the treatment of gonorrheal urethritis in the male, because it has a high cure rate and a low incidence of toxicity, it causes the prostatic fluid to become free from living gonococci sooner than any of the other sulfonamides. Sulfathiazole is very effective therapeutically and causes few toxic reactions. Sulfapyridine would better not be used in the treatment of gonorrhea in the ambulatory patient. It is effective therapeutically, but it gives rise to many and severe toxic reactions.

**Effect of Pitressin on Renal Circulation and Urinary Secretion**—Wakim and his associates describe attempts to demonstrate the alterations in the glomerular tufts of capillaries and other vessels in the frog kidney, as seen under the microscope, and the changes in renal blood flow in the dog kidney under the influence of pitressin when administered through the various possible routes under similar conditions. The preparation used was pitressin in ampules (1 cc = 20 units). The data presented justify the conclusion that the same preparation of pitressin administered under identical conditions into the same animal produces different effects on the renal blood flow, depending primarily on the route of administration. Subcutaneously administered it produces slight, if any, change in the blood flow. Intramuscular injections give variable results, possibly dependent on the vascularity and activity of the area involved and its influence on the rate of absorption. Intravenously administered pitressin invariably decreases the blood flow, caution regarding its intravenous use may aid in the prevention of untoward effects.

**Pathogenesis of Chorea**—Buchanan and his associates examined the brains of 2 patients who died while suffering from acute rheumatic chorea. Many cases of chorea have shown at necropsy gross lesions of the basal ganglia. Such lesions have been so well circumscribed that it has been possible by

correlating the predominant clinical involvement with that of the pathologic lesion to deduce a somatotropic localization within the striatum. Such discrete involvement is rarely seen in choreas of childhood, it occurs in the arteriosclerotic senile choreas. The pathologic substrate of chorea is to be found in many different parts of the central nervous system. The authors are inclined to believe that the cerebral cortex plays a fundamental role in the production of choreic movements. In favor of this thesis is the abnormal activity of the electroencephalogram. The motor area is probably the most directly responsible for the production of the choreic movements. The changes in the brains of choreic patients, however, are not confined to the cerebral cortex. The cerebellum, its efferent pathways, the striatum and the thalamus are frequently affected. There is evidence of at least two circuits impinging on the motor cortex and playing an important part in its normal function. They are the corticopontocerebellodentatorubro-thalamocortical and the corticostriothalamocortical circuit. There is a constant stream of impulses passing through both of these nerve circuits, even when the organism appears to be at rest. At least two subcortical circuits may modulate the activity of the motor cortex. In addition, the cortex of the postcentral gyrus and of other parts of the cerebrum influence the activity of the motor area. It is thus apparent that by modifying the influence of any of these mechanisms the motor cortex may be made abnormally sensitive and responsive to what would ordinarily be subliminal stimuli. The presence of lesions in the cerebellum and its efferent pathway, the thalamus and the striatum must interfere with these modulating circuits and conceivably could make the motor cortex abnormally sensitive. It does not seem probable, however, that such lesions furnish the stimulus setting off the abnormally sensitive cortex. There must be another factor influencing the production of the motor phenomena of chorea. The authors suggest that the cerebral cortex is the level at which the movements of chorea originate, but they believe that these abnormal movements occur only when the motor cortex is hyperexcitable congenitally or because of lesions in physiologic arcs or circuits which normally modulate the activity of the cerebral cortex.

**Renal Thrombosis in Infancy**—According to Campbell and Matthews, renal thrombosis in infants and children is an exceedingly grave condition and terminates fatally in practically every case not promptly treated surgically. In infants, the colitis is the chief predisposing cause, the initial renal lesion in most cases is a massive hematogenous acute pyelonephritis. The precise factor or factors engendering the early intrarenal lesion are unknown. The authors present 2 case reports. In case 1 the prothrombin level was strikingly low (one minute and ten seconds) and there is reason to believe that the level was correspondingly low in case 2. Yet in each instance a high prothrombin level was rapidly achieved by the administration of vitamin K. The authors present the clinical manifestations and say that in a large portion of the cases adequate urologic studies should establish the urgent surgical nature of the condition. In some the correct diagnosis will be made preoperatively. When the disease is unilateral, the child not hopelessly septic, a prompt nephrectomy employed, about 75 per cent may be expected to survive. In the 2 male infants the subject of the report, cystoscopy, divided renal function tests and retrograde pyelography were carried out in the early days of the disease, shortly after the onset of the disease. Both were cured by nephrectomy.

**Renal Disease and Arterial Blood Pressure.**—Flocks studied the urinary tracts of 38 patients with congenital hydronephrosis, infected hydronephrosis, renal stone, and hypertension by means of flat film pyeloureterogram and phenolsulfonphthalein and urea excretion from the individual kidneys. By comparing the results with normal values he estimated the amount of bilateral ischemia present. In 23 subjects there was a decided systolic and diastolic elevation of the blood pressure. The urinary tracts, from the point of view of the flat film and the pyelogram of 14 were perfectly normal. 4 presented somewhat smaller kidneys than normal bilaterally. 2 showed unilateral small kidneys. 1 showed a slight hydronephrosis on one side and slight pyelonephritis on the other. 1 showed a stone in the left kidney pelvis and 1 showed a mild hydronephrosis on the right side. Renal changes were extremely minor compared to the functional impairment. Of the 23 patients 6 showed unilateral renal ischemia, 14 bilateral renal ischemia, and only 3 normal function bilaterally with no demonstrable ischemia. Removal of the ischemic kidney of 2 patients with a relatively definite unilateral ischemia resulted in a return of the blood pressure to normal. One of the 38 patients had paroxysmal hypertension with no anatomic or functional renal abnormality. Of 8 patients with a systolic blood pressure of less than 140 and a diastolic pressure of less than 90, none had any evidence of renal ischemia. Two of the 8 showed no renal disease. 2 showed congenital hydronephrosis. 1 had bilateral branching renal calculi. 1 had extensive infected hydronephrosis bilaterally. 1 had a stone in the right kidney pelvis and 1 had a mild pyelonephritis bilaterally. Although the incidence of renal disease was higher in this group than in the group with hypertension, the impairment of phenolsulfonphthalein excretion corresponded to the anatomic damage as demonstrated by the flat film and pyelogram. The remaining 6 patients had blood pressures which ranged between 145 and 170 systolic and 80 to 95 diastolic. In only 1 of them was there definite evidence of extreme impairment of phenolsulfonphthalein excretion as compared to renal substance.

**Bilateral Minimal Renal Tuberculosis.**—Creevy reports a case of minimal bilateral renal tuberculosis proved by pyelography and guinea pig inoculation which has apparently healed on a regimen of good sanatorium care. He does not seriously propose that frankly destructive unilateral renal tuberculosis without active disease elsewhere be treated conservatively but wishes to point out that the possibility of healing exists. The

patient continues to be well eleven years after the apparent onset and ten years after the last demonstrable bacteriologic evidence of activity. Calcium has been deposited in the area of destruction on one side.

**Wound Therapy with Carbamide-Sulfonamide Mixtures.**—According to Holder and MacKay, five fundamental principles are pertinent in wound therapy: (1) control of hemorrhage, (2) rest and immobilization, (3) infection, (4) blood supply, and (5) elimination of necrotic tissue. Symmers and Kirk first used urea successfully in the treatment of infected war wounds during the first world war. Because of the unsatisfactory connotation to some of the term urea and because of the appearance of this substance in urine, the authors have chosen to use its synonym carbamide. A five year trial involving every type of contaminated and infected wound confirmed the observations of Symmers and Kirk as to the harmlessness of carbamide to normal tissues. Its use in relatively avascular tissue, as in tendon sheath infection and in primary tendon suture, demonstrated its nonirritating character. Animal experiments revealed no instance of damage to normal healthy tissue cells. The healthy quality of granulation tissue produced by carbamide therapy is especially favorable for subsequent successful skin grafting. In foul smelling infections the deodorizing effect of carbamide is important. The rate of healing is not retarded in any wound and is improved in grossly infected wounds. Carbamide action rids the wound of necrotic tissue and thus of sulfonamide inhibitors. The hypertonic action of carbamide produces a maximum cellular defense reaction resulting in diapedesis of phagocytic elements. The sulfonamide component exerts a maximum bacteriostatic action. Sulfanilamide was mixed with carbamide so as to represent 10 per cent of the mixture. The authors feel that in the treatment of traumatic wounds, especially war wounds under the difficult conditions of combat, the more simple and more efficient treatment should command attention. The carbamide-sulfanilamide mixture meets these requirements. Any one trained in first aid work may apply it. The mixture is stable, not bulky, and easily carried. It can be universally applied to all types of wounds either in crystal form or as a saturated solution for irrigation. Application of the crystals to wounds is rarely necessary more than once in twenty-four hours, thereby reducing the amount of necessary care, materials, and trauma to the wound, giving the patient the maximum of rest and comfort. The use of sterile wax paper as the first layer of a dressing still further simplifies dressings and reduces wound trauma.

**Traumatic Fat Embolism.**—Gerwig reviews the salient features of fat embolism in man and reports 9 traumatic cases from the records of the University Hospital, Baltimore. In 1 of the 9 cases death was due to a nonsaponifying mineral oil that had been instilled into the urethra to facilitate the passage of a catheter. The remainder of the cases were all instances of true fat embolism with recovery. In 2 the author believes that trauma of some sort was the causative factor in every case. He classifies the mode of production as follows: A. Traumatic. 1. Bones: (a) fractures, separations, or dislocations; (b) concussion, jarring, or operations on bone. 2. Soft tissue: (a) lacerations in fat, fatty viscera, or in the presence of oil; (b) childbirth. B. Nontraumatic. In cases of trauma presenting unexplained fever, shock, coma, dyspnea, congestion, fall in hemoglobin, and urinary changes and in all cases of fractures, especially of the long bones, fat embolism should be looked for. Diagnostic methods include staining of sputum and urine for fat hemo-

globin determination and ophthalmoscopic examination for fat in the retinal vessels. Chest roentgenograms may become valuable in the future. Prophylactic or curative treatment is not specific and is confined to symptomatic and palliative care.

**Volkmann's Ischemic Contracture**—Evidence is presented by Foisie that Volkmann's ischemic contracture is not a complication of an improperly treated supracondylar fracture of the humerus but is the result of ischemic infarction produced by segmentary arterial spasm of the main artery to an extremity, with reflex spasm of the collateral circulation. Thus a subtotal ischemia is produced and the bellies of muscles which have the greatest demand for arterial blood, and therefore are the most vulnerable to this loss, are the first affected. Gangrene of the fingertips or partial or even complete gangrene of the extremity would result if this spasm continued in sufficiently severe degree, but, when Volkmann's contracture is the only result, some improvement in the arterial supply intervenes. This vasomotor activity is controlled by the sympathetic nervous system. Initially the lesion in acute cases is one of impaired circulation. In old cases with an established deformity the normal blood supply has returned and the problem is to correct existing deformity by physical therapy, tendon lengthening, bone shortening and the like.

**Epidemic of Boils in a Group of Tunnel Workers**—Gant and his associates state that since February 1941 there has been an epidemic of boils among the workers of the Carlton Tunnel, Cripple Creek, Colo. In about five months 22 workmen gave up work because of boils. Most of the lesions were on the wrist and neck. They were, as a rule, deep seated nodules with a fluctuant central mass and an area of erythema in the adjacent skin. Many of the lesions had broken down or had been incised by the company physician and were exuding thick, yellow pus. Several were typical carbuncles with numerous openings from which purulent material was discharging. Fourteen different jobs are involved in tunneling, but the majority of boils occurred among seven jobs entailing the greatest con-

tact with water, rock dust, perspiration and friction from working clothes. Study revealed that the cause of the outbreak was a combination of these factors, which lower the resistance of the skin to pyogenic bacteria. Prevention can be obtained by having adequate, usable bathing facilities, enforced bathing at work, daily change of work clothes, individual raincoats, rubber boots, safety hats, respirators and neck towels, daily washing of the rubber clothing, sanitary toilet facilities in the tunnel and early medical aid if boils appear in spite of these precautions, the men should not use adhesive tape on the skin, as removal pulls out the hairs and opens hair follicle, which become new ports for infection.

**Treatment of Epidemic Meningitis**—From January 1 to July 1940, 97 cases of epidemic meningitis were treated with antiscrum, antitoxin and sulfanilamide either alone or in conjunction with one another. Tripoli reports that the effect of omitting intraspinal therapy was striking. Of 70 patients receiving intraspinal therapy of one form or another 28 died and of those not receiving intraspinal therapy only 1 died. The combined use of antitoxin and sulfanilamide gave better results than either agent alone. Serum therapy, regardless of the type of antitoxin, gave nearly as good results as either antitoxin or sulfanilamide. Of 18 patients given a sulfonamide derivative orally and antitoxin intravenously between July 1940 and October 1940, none died. Sulfanilamide was used in 4, sulfathiazole in 11, sulfapyridine in 11. Five of the 18 were treated only with sulfonamides orally. All the 18 patients recovered and were discharged after twelve to twenty-three days of hospitalization.

**Glossopharyngeal Neuralgia**—Spurling and Grantham encountered a patient with a severe neuralgia of the ninth cranial nerve. The ear with two sharply defined trigger points, one in the fossa and the external auditory canal. The trigger points indicate that the trigger points in the ear and in the throat were separately innervated, as complete cocaine anesthesia failed to change the irritability of the trigeminal nerve. Sectioning the glossopharyngeal nerve at the two strands of the vagus relieved the glossopharyngeal pain completely and permanently. This relieved the pain of glossopharyngeal neuralgia with trigeminal neuralgia of the throat and the lateral surfaces of the face relieved by a glossopharyngeal section alone.

**Treatment of Patients with Severe Burns**—According to Allen and Koch the surgical principles in treating burns are (1) to prevent and combat shock, (2) to convert the open contaminated wound into a clean wound (3) to cover the open wound by the simplest possible dressing that protects it from constant recontamination does not fix or destroy any remaining viable skin or subcutaneous tissue provides for drainage of the serum that exudes from the burned surface until this is checked by pressure or normal coagulation exerts a uniform moderate pressure over the burned area and that can be easily removed, (4) to keep the injured part at rest and (5) to secure healing in the least time and with a minimal loss of function. The initial shock is due to pain fright and overexertion it is often soon followed by secondary shock resulting from loss and shifting of body fluids. If, in spite of every effort to prevent loss of body fluid, shock and collapse develop, replacement fluids are life saving. Thirst, restlessness and a rapid pulse rate are constant and important signs of fluid loss and indicate the need for the prompt administration of plasma. The administration of oxygen, particularly to patients with burns of the face and chest is a valuable adjunct to treatment. The most important source of infection of a burned surface is from the open mouth and uncovered nose of a person working over the injured patient. Infection can be prevented almost always if the patient is seen promptly after injury and if he has not received extensive or prolonged first aid treatment. The simplest and safest method of converting an open contaminated wound into a clean wound is by gentle thorough cleansing with plain white soap and sterile water applied with gloved hands under eyes that are averted and mouth and nose that are carefully masked. After the injured surface has been cleansed it is covered with a few layers of fine meshed sterile gauze impregnated with petrolatum. This dressing does not adhere and does not fix tissue, but it permits drainage of serum and exudate into the dressings outside it. Over the petrolatum gauze a half dozen layers of flat

dry sterile gauze are laid and over this mechanic's waste or sea sponges to provide a resilient covering under retention bandage furnishing even pressure without constriction. Uninterrupted and enforced rest of injured tissues is an important and essential part in the treatment of severe burns. The authors conclude that it is neither logical nor wise to substitute for a safe and tested method an elaborate time consuming procedure which involves the use of powerful chemicals concerning whose possibilities for harm there still is doubt.

**Continuous Spinal Anesthesia**—Lemmon and Paschal present a statistical report on their first thousand cases of continuous spinal anesthesia. They used procaine hydrochloride because it is the least toxic of all drugs used in producing anesthesia by injection into the subarachnoid space. This anesthesia is maintained as long as necessary by adding subsequent small doses. Thus spinal anesthesia has been changed from the "single dose" to the "fractional dose" method and it is placed in the same category as other anesthetics administered by the continuous or fractional dose method. The operations in 970 cases were below the diaphragm and in 30 above it. The average length of the operations was fifty and four-tenths minutes with extremes of two hundred and fifteen minutes for a total gastrectomy to only about two minutes for the incision and drainage of an abscess. The average total dose of procaine hydrochloride was 2199 mg. In the operations done above the diaphragm the general average was 445 mg. The largest dose given to any patient was 2,200 and the smallest 20 mg. Various dilutions from 1 to 10 per cent solutions were used. The blood pressure was recorded every five minutes. Soon after the patient received the preliminary injection of ephedrine sulfate and procaine hydrochloride to anesthetize the skin and support the blood pressure there was a general elevation of the blood pressure. After the operation was in progress the pressure tended to become constant or to fall below that at the onset. The average high blood pressure was 129.9 and the average low 103.4. In several instances the blood pressure fell to a systolic of 40 mm. The authors rarely use vasoconstrictors in these conditions but have found that venoclysis or blood transfusion affords the best relief. The incidence of headache after spinal anesthesia was 28 per cent which approximates that seen after the single injection method. In most instances this complaint was relieved by acetylsalicylic acid or by lowering the patient's head. The incidence of urinary retention was 3.4 per cent that is, it was no more frequent than with the ordinary method of spinal anesthesia. There were 34 cases of pulmonary complications: 19 bronchopneumonia, 9 lobar pneumonia, 4 atelectasis and 2 pulmonary embolism. There were no motor or sensory disturbances, no cranial nerve palsies or other neurologic phenomena. Of the 47 patients who died (4.7 per cent) 24 had malignant growths, 9 died from diffuse peritonitis and the other contributing factors causing death were pulmonary, cardiac and renal conditions. In a total of more than 2,000 known cases there has not been a death from continuous spinal anesthesia.

**Sulfanilamide in Compound Fractures**—From Nov 1, 1940 to Nov 1, 1941 Davis and his associates treated 30 compound fractures by implantation of sulfanilamide powder and primary closure of the wounds. Injured nerves and tendons were repaired if the patient's condition permitted. No other

sutures were used except in the skin. The edges of the skin wound were approximated without the use of drains. If an accurate reduction could not be maintained, the authors did not hesitate to use internal fixation. Appliances made of vitallium were preferred whenever possible. The wounds in 28 of the 30 compound fractures have healed by primary intention. In 2 cases local infection developed. There was no systemic evidence of infection in either of these cases. In 1 case infection was confined to the soft tissues and in the other a localized osteomyelitis developed. There were no cases of gas infection. The authors conclude that the mortality and morbidity following compound fractures can be lowered if the outlined treatment is followed in a routine manner.

**Diphtheria in a Nutrition Camp**—Turner reports an outbreak of 28 cases of diphtheria in a children's nutrition camp which could not be controlled by the usual public health measures. The camp facilities and handling were known and fully approved before the outbreak (water, sewage disposal, screening, food handling, infirmary). A careful study of the outbreak was possible. 1. One hundred and sixteen (92.8 per cent) of the 125 children in this camp had previously had alum precipitated toxoid, negative Schick, or both. Twenty-six (22.4 per cent) of these contracted diphtheria. 2. The protection given by one dose of alum precipitated toxoid was less than that reasonably expected and previously noted when immunized school children have been exposed to diphtheria. 3. The negative Schick test was of little value in determining the state of immunity. The same applied whether the test was done in school one to two years previously or in camp before diphtheria developed, or both. 4. Exceptions to statements 2 and 3 were shown by all children having previously had their tonsils removed. Although there were 5 proved carriers among 25 of these children, none had diphtheria. Predisposition for tonsillar tissue was exhibited, with 1 exception of diphtheritic conjunctivitis. 5. The organism was of the "gravis-like" type. The authors believe that they were dealing with a diphtheria germ which possessed or had developed increased virulence or increased invasive properties.

**Esophagopleural Fistulas**—Cohen and Sindell report the occurrence of a rupture into the esophagus of a patient undergoing treatment for a tuberculous empyema. The patient was a 30 year old white woman with tuberculosis of the left lung treated with pneumothorax for one year. The sputum became

negative and refills were stopped. Six months later an empyema developed which could not be controlled by oleothorax or aspiration and irrigation. One year after the appearance of the fistula containing tubercle bacilli a variegated bacterial flora was recovered from the pleural exudate. Yeast cells were also found. An esophagopleural fistula was demonstrated by barium meal. A thoracotomy was performed and feedings were given by a stomach tube. Signs of intraperitoneal hemorrhage with bloody drainage from the thoracotomy tube soon developed. The patient dying three and three-fourths years after the onset of the disease, one year after the empyema developed, and six months after the esophagopleural fistula had formed. Post-mortem disclosed an esophageal fistula at the level of the fourth dorsal vertebra, a healing cavity of the left upper lobe, disseminated milary tuberculosis, a chronic left tuberculous empyema, multiple recent tuberculous ulcers of the esophagus around the fistula and perforation of the left dome of the diaphragm with intraperitoneal bleeding from splenic rupture. The immediate causes of death were disseminated milary tuberculosis and intraperitoneal hemorrhage. Sixteen similar cases are reviewed from the literature. MacDonnell (1844) is credited with the first recorded case. The empyema was tuberculous in 7, nontuberculous in 6 and not stated in 4. The prognosis of esophagopleural fistula in chronic empyema is poor but in acute nontuberculous empyema it is comparatively good. Of the 17 patients 10 died, 5 were cured, 1 was living at the time of the report and in 1 the final outcome was not mentioned. Treatment consists in preventing oral contamination of the pleural space, adequate drainage and obliteration of the empyema.

**Right Bundle Branch Block**—Prompted by the impression that patients with right bundle branch block present a better prognosis than do those with cardiographic evidence of a left bundle lesion, Perera and his collaborators studied a group of cases of the former disorder with particular reference to the survival time following diagnosis. They present an analysis of 104 cases of right bundle branch block. They observed that reduplicated heart sounds, gallop rhythm and pulsus alternans were uncommon in this series. The two latter disorders were noted in a small group in which advanced heart disease was present. Forty per cent of the patients had no appreciable subjective discomfort from the heart. In fact some have no subjective or objective evidence of heart disease apart from the right bundle branch block. The average survival time after the diagnosis of right bundle branch block in 29 fatal cases was three years. In the 6 patients who came into the hospital more or less moribund and died within a few days are excluded, the average survival period of the fatal group was four years and five months. Of the 62 patients alive when last seen or heard from the average survival period was four years and one month. The longest survival period among the living patients was seventeen years and among the fatal cases sixteen years and seven months. The impression that patients with right bundle branch block have a distinctly more favorable prognosis than do those with a left bundle branch lesion has been sustained.

**Blood Changes After Plasma Transfusions**—Reduction in hemoglobin concentration of the blood following a rapid transfusion of a known quantity of plasma has been used as a means of calculating the pretransfusion blood volume. This method according to Beattie makes several assumptions (1)

that complete mixing of the plasma with all the circulating blood takes place, (2) that the number of red cells in circulation during transfusion and mixing remains constant and (3) that the plasma volume after transfusion and mixing is equal to the volume of plasma before transfusion plus the volume of plasma transfused. If one or more of these assumptions is incorrect the blood volumes estimated may differ considerably from the true blood volume. It has been assumed (Hayward, 1942) that when the hemoglobin concentration returns to its pretransfusion level the volume of plasma transfused has been eliminated from the blood stream. This assumption implies that the only factor which causes an increase in hemoglobin concentration is the movement of fluid from the blood. It is important therefore to examine any evidence which throws light on the validity of these fundamental assumptions. The author describes observations made during an investigation into the physical and chemical changes in the blood after transfusion of plasma. His studies were made on cats. Intravenous transfusions of plasma into anesthetized animals are followed by changes in hemoglobin concentration and plasma protein content which cannot be explained on the basis of a simple mechanical mixing of the transfused plasma with the circulating blood. The formation of surface films of plasma in capillaries opened up to receive the transfused plasma reduces the amount of plasma available for dilution of the circulating blood and leads to high hemoglobin values with consequent high estimates of blood volume. Movement of protein free fluid from the blood stream cannot account for the observed changes in plasma specific gravity and hemoglobin concentration. Movement of plasma proteins probably occurs simultaneously with this shift.

**Blood Volume After Transfusion**—Hayward and Jordan state that the widespread use of intravenous serum or plasma in recent months has aroused interest in the effect of transfusions on the blood volume and the fate of the transfused protein. They have made observations on changes in the blood volume and the fate of the serum protein in normal patients and in a series of patients with peripheral vascular disease. The importance of plasma protein in regulating blood volume has been emphasized by Chang (1932). He found that the blood volume was reduced in nephrosis and that any rise in plasma protein concentration was accompanied by a rise in plasma volume. He concluded that plasma protein concentration is one of the regulating factors of circulating volume. The fate of the injected protein is interesting. There is good evidence from animal experiment that transfused serum protein can be utilized in body metabolism and will maintain a protein fasting animal in nitrogenous equilibrium. In the present series of cases, changes in the blood volume after serum or plasma transfusion have been followed by means of estimations of the hemoglobin and hematocrit readings. The serum used was pooled serum and had a total protein content of about 7 Gm per hundred cubic centimeters. In a few cases citrated plasma was given the protein content of which varied from 4.06 to 6.25 Gm per hundred cubic centimeters. The initial blood volume of most of the patients was presumed to be normal. The hemoglobin and therefore the blood volume after transfusion of 800 to 1200 cc of serum or plasma returned to normal in from two to five days. Statistically the hemoglobin values fall immediately after transfusion and return to their pretransfusion level in three days. On the fourth and fifth days there is no significant lowering of the average hemoglobin value. The changes in the hematocrit readings confirm the results obtained from hemoglobin determinations. The hematocrit readings did not always return to their initial values when the hemoglobin had returned to normal. Such a difference, if real, must mean that while the hemoglobin content of the individual cells remains unchanged the cell volume decreases. The total protein concentration of the circulating plasma was studied in 17 cases. In no case was any significant change found to occur in the plasma protein concentration, so that the transfused fluid and protein are removed from the circulation together. The fate of the injected protein is obscure. None appeared in the urine following any transfusion. If metabolism of the excess protein occurs rapidly some change in the blood urea may be found. The blood urea was studied after eleven transfusions of serum the results revealed no consistent rise in the blood urea.

**Sulfonamide Resistant Streptococci in a Plastic Surgery Ward**—The occurrence in a surgical ward of 13 cases of infection by a sulfonamide resistant strain of *Streptococcus pyogenes* of type 12 despite the institution of precautionary measures leads Francis to conclude that cross infection was still occurring. The precautionary measures were the local application of sulfanilamide powder, improved dressing technic, the application of spindle oil to ward floors, formaldehyde disinfection of wards vacated by infected patients, segregation of patients and the prophylactic oral administration of sulfanilamide to patients undergoing operations. The 13 cases occurred in one male ward and all but 2 in that half of the ward to which the first infected patient was admitted. This patient was treated in a bathroom at the end of a passage, from which opened successively the bathroom, a staircase, linen room, two four bed rooms, an eight bed room and four single bed rooms. In cases 3, 4 and 7 the presence of the sulfonamide resistant streptococcus did not cause any general reaction or change in the appearance of the wounds, but in each case surgical intervention was followed by a severe infection. In cases 5, 6, 9, 10 and 12 severe infection occurred without surgical intervention. It is not suggested that *Strep. pyogenes* type 12 is resistant to the sulfonamide derivatives, in fact, several sensitive strains of this type have been encountered. There is no evidence to connect them with this series of cases. A resistant strain of group A, type B 3264, has been isolated in 2 cases. The spread of the infection was recognized owing to the practice of making repeated examinations of the wound flora and of typing streptococci if a new infection was suspected. The mode of spread has not been satisfactorily explained. A "no touch" technic was not employed for dressings at the time, reliance was placed on sterile gloved hands. The gloves, put on at the beginning of a dressing round, were washed with soap and water for two minutes between dressings. Aerial dissemination of infection from blankets and dressings might have spread the infection. At the time the blankets were not treated with oil, as is now recommended. It is possible that the bath in which case 1 was treated served as the vehicle in 2 or 3 cases, but the evidence is not conclusive. The bath was disinfected after use by a method similar to that described in the Medical Research Council War Memorandum No 6, but this bath had a mixer input, covered by a riveted brass disk, which was below the surface of the water when the bath was filled, and this could not be adequately sterilized. The control and treatment of such resistant infections will probably depend on substances like gramicidin and penicillin. In case 3 the infection producing serious trouble after a grafting operation was successfully eradicated by local applications of gramicidin. In vitro experiments have shown that these sulfonamide resistant streptococci are just as easily inhibited by gramicidin as are sensitive strains.

**End Results of War Burns**—In this war, burns have been common in the services and among civilians. Given proper treatment, Wakeley points out, 90 per cent heal and do not give rise to permanent deformities or disabilities, but in about 10 per cent there is definite disfigurement or scarring. During World War I slightly more than 20 per cent were left with persistent deformities of the hands or face in spite of plastic and other operative procedures. This high incidence was due to sepsis, which still is the bugbear of the treatment of war burns and to which the majority of scarring deformities are due. In the last war the common cause of war burns was cordite, and the face and hands were the sites most frequently affected. The Admiralty adopted protective measures for all gun crews, which consisted of asbestos gauntlets and a hood over the head and shoulders. This so-called "antiflash gear" was in use at the outbreak of the present campaign. But it soon became clear that more protection was required for the face, for the ships were subjected to repeated dive bombing, from which a common type of facial burn resulted. Extra pro-

tection was given in the form of an eye shield of cellulose acetate and a small mask of "Aertex" material impregnated with a heat resisting solution. Since the introduction of this additional protection the number of burns of the face and hands has fallen considerably, but this extra protective covering is not trying in the tropics and is not always worn, and so burns still occur among men who have neglected this form of protection. To arrive at a definite final assessment of war burns, exact knowledge of the extent and depth of the primary injury is necessary. Complications can be prevented by early skin grafting, but although this is well recognized it is not undertaken as often as it should be. With war burns the medical officer who attends the initial burn rarely sees the case through the healing stages. To prevent this constant evacuation of burn centers with special wards and equipment should be established. The Ministry of Health, the Navy and the Air Force have recognized this necessity and have instituted special hospitals to which all the seriously burned are transferred as soon as possible. These burn centers are in reality research stations, and the observations of the best methods of treatment should clarify this very controversial subject. A follow-up is just as important in burns as in fractures if anything is to be learned about the best forms of treatment and their end results. Only the severely burned reach the burn centers where the final result is known, but it is equally important to have some idea of the final result of the less severely burned for comparison with the severe type. The profession tends to take little interest in a burn when once healing has occurred. This is a great pity for the follow-up of service cases has proved the great value of the continued use of hydrous wool fat. In the after treatment of extensive burns superficial roentgen therapy can play an important part, especially if there is any suggestion of a keloid, and when extensive skin grafting has been performed and there is a danger of excessive formation of collagen between the grafts. While it is important to follow up burn cases for months it is also important that these patients should not be submitted to extended hospitalization. Patients with extensive burns, especially if skin grafting has been employed, should be moved to a convalescent home as soon as healing is complete. The change of scene and company helps to sustain their morale. In the convalescent home or rehabilitation center the patients must be encouraged to exercise their minds as well as their burned parts by graded games and competitions. In some cases a man's promotion may come through while he is in hospital, and therefore the rehabilitation center must have facilities for study or instruction so that he may take his place in the service when he returns. The centers should have an outpatient clinic where patients can be seen and treatment given for part of the day while for the rest of the day they are employed in some duty at the depot, barracks or port. Many key men may have to be invalided out of the services until such facilities are forthcoming.

Cervicobrachial and Lumbosacral Radiculalgia of Vertebral Origin M Monnier—p 1480

**Aseptic Necroses**—Meyer-Wildisen discusses aseptic, trophic bone disturbances which develop in the epiphyseal or apophyseal portions of the skeletal system. They involve particularly the subchondral areas of various joints, the growth zones and the articular cartilages and are found chiefly in young persons. Among these are malacia and necrosis of the os lunatum, necrosis of the os naviculare (Köhler's disease I), the analogous disorder of the second and third metatarsal heads (Köhler's disease II), chondropathia patellae and Schlätter's disease or impaired ossification of the tuberosity of the tibia. Perthes' disease (osteochondropathia coxae juvenilis) presents the best known and one of the most important diseases of the epiphyses and apophyses during the period of growth. Diseases of the vertebral column that have genetic relations to aseptic trophic bone disorders are (1) Calve's vertebra plana and (2) adolescent kyphosis (Scheuermann's disease). Secretory and constitutional factors play a part in many of these conditions. Chronic repeated slight external injuries often precede the onset. In cases in which no intervention is made, the course is generally extremely chronic. In a certain percentage of the cases of osteochondritis, traumatic influences act as an indirect cause. Traumatic cases are nearly all found in soldiers or in persons who are active in sports, they are unilateral, anatomic and functional cure is generally effected by surgical treatment. Such complete cure cannot be obtained in disorders in which constitutional and endocrine factors play a part.

**Epidemiology of Acute Epidemic Myalgia (Bornholm Disease)**—Rehsteiner reports an epidemic of acute myalgia (Bornholm disease) in a summer camp consisting of 104 boys, the majority of whom were between 12 and 15 years old. Of these 29 presented typical acute pain in the chest and abdomen, respiratory difficulties and fever. 4 were atypical cases. Some of the patients exhibited meningism, hematuria, nasal hemorrhages, vomiting and mild catarrhal symptoms of the upper air passages. The index of contagion was 32 per cent, relapses appeared in 58 per cent. The mode of infection could not be demonstrated. This epidemic of Bornholm disease remained limited to the camp; the author also cites examples of the sporadic occurrence of the disease. The epidemiologic behavior of acute myalgia closely resembles that of acute anterior poliomyelitis but it differs from it in symptomatology and must be regarded as an independent nosologic entity.

Primary Tuberculosis and Metatuberculosis in Military Service. W Löffler and M Kartagener—p 1615  
\*Vitamin K in a Severe Case of Rheumatic Purpura H Schaad—p 1622

**Iodine Deficiency or Goiter Noxa**—Blum discusses the question whether goitrous enlargement is a sequel of iodine deficiency or the result of a specific noxa. If iodine deficiency were responsible for the development of goiter, the iodine supply would have to be either entirely deficient or the iodine of a type that cannot be assimilated. In the case of a goiter produced in rabbits by feeding cabbage neither of these two factors plays a part and apparently a noxa is responsible. He describes experiments in rabbits which demonstrate that there is a ratio of equilibrium between an antistrumigenic and a strumigenic diet. The primary point of attack for this noxa is not the thyroid but the liver. Under the influence of the noxa active in cabbage goiter the liver loses its capacity to split hydrogen iodide from vegetable iodine and thus cannot supply the thyroid with this substance which is essential in the iodine protein elab-

oration, whereas the thyroid itself retains the capacity to utilize potassium iodide. The blockage of the hepatic "de-iodase" for vegetable iodine produces the iodine deficiency of the thyroid, which in turn makes impossible formation of iodine protein. Whether the noxa exerts a harmful effect also on the cells of the thyroid, the author is unable to state. It does not deprive the thyroid cells of the capacity to produce iodine protein from administered potassium iodide. Considered from this point of view, prophylaxis with iodized salt attacks not the site of the primary impairment the liver, but rather the subsequent point, the thyroid.

**Vitamin K in Purpura Rheumatica**—Schaad reports the history of a man aged 51 with a severe form of rheumatic purpura. Acetylsalicylic acid, aminopyrine and intravenous administration of calcium and of vitamin C produced only temporary improvement. On a treatment with vitamin K and calcium injections the purpura rapidly subsided and a permanent cure was apparently obtained.

\*Treatment of Herpes Zoster with Vitamin B<sub>1</sub> A Zubiri—p 578

**Malignant, Arsenoresistant Syphilis**—According to Lana Martinez not only has the incidence of syphilis increased in Spain recently but its virulence is such as has not been seen since the prearsphenamine era. Patients who have undergone intensive treatment with arsenic preparations still exhibit lesions and strongly positive serologic reactions. Arsenoresistant cases of syphilis began to increase in many countries after 1927. Three factors may play a part in arsenoresistance: (1) the medicament, (2) the special reaction of the spirochete to the medicament and (3) deficiency in the defensive powers of the organism and its incapacity to break down the arsphenamine into the active form. The cause of the more severe forms of syphilis and of the greater frequency of the arsenoresistant cases must be sought in a combination of different factors. The organism and the drug must act together to effect a cure. If either fails, the therapeutic effect will not be adequate. Syphilitic waves coincide with periods of economic depression, which are accompanied by increase in prostitution, laxity of morals and decline of restraints. As a result a larger number of persons come in contact with the spirochete than is the case ordinarily. The more frequent, rapid and shorter passages are conducive to a greater virulence. Buschke and Joseph recommend for the treatment of malignant and arsenoresistant syphilis bismuth compounds, mercurials, iodine, iodides, gold salts and autohemotherapy. The organism may be influenced by injections of sodium nucleate, milk, turpentine sulfur and hyperthermy. Alcohol and tobacco are to be discouraged, gymnastics, baths and life in the open air encouraged. Liver, thyroid and vitamins have been recommended. Neoarsphenamine and preparations of bismuth should both be employed. Vitamin C is given to improve the tolerance of the organism to these drugs.

**Progesterone for Prevention of Abortion Following Gynecologic Operations**—Clavero Nuñez reports the occurrence in a woman aged 27 of several uterine myomas, one of which on the posterior surface of the uterus was unusually large, its lower pole descending into the pouch of Douglas and blocking the vagina. Removal of the tumor was performed during the twenty-second week of pregnancy. Immediately after the operation, 10 mg of progesterone was administered intramuscularly and repeated on the following days until a total of 40 mg had been given. The recovery was uneventful and the pregnancy was carried to term. In the second case appendectomy and salpingectomy were performed during the tenth week of gestation. The ovary of the same side was normal and was the seat of a corpus luteum of pregnancy for which reason

special care was taken to preserve it. The patient, a woman aged 25, likewise received 40 mg of progesterone in the same manner and with the same results. The postoperative course was favorable and the pregnancy was carried to term.

**Vitamin B<sub>1</sub> in Herpes Zoster**—Zubiri reports 3 cases of herpes zoster in which he obtained satisfactory therapeutic results with vitamin B<sub>1</sub>. The pain subsided after one or two days and the vesicles dried up in three days. Others have used vitamin B<sub>1</sub> successfully in the same condition. Administration of vitamin B<sub>1</sub> appears to be the most rational treatment of herpes zoster.

\*Rupture of Spleen in Typhoid C. Magarinos Torres and J. Guilherme Lacorte—p 363

**Rupture of Spleen in Typhoid**—Magarinos Torres and Guilherme Lacorte report the necropsy of a man aged 21 who died of typhoid in the second week of the disease. Eberthella typhosa was present in blood culture. Acute perisplenitis, intracapsular hemorrhages and distention of the capsule of a greatly enlarged spleen were present. These changes with possibly a slight trauma seemed to have been the cause of the spontaneous rupture of the spleen and the consequent hemoperitoneum (2 liters) which caused death. Eberthella typhosa was also recovered in pure cultures from splenic tissue.

\*Actual Results of Roentgen Therapy in Artificial Pneumonia C. Fried—p 1

**Roentgen Therapy in Experimental Pneumonia**—Pneumonia produced by transtracheal injection of pneumococci of types 1, 2 and 3 in guinea pigs has the same macroscopic and microscopic appearances as has pneumonia caused by hemolytic staphylococci. The action of roentgen irradiation in this type of pneumonia is much the same as in staphylococcal pneumonia. When roentgen therapy is applied between the sixth and tenth hours after the infection it prevents or diminishes the growth of the inoculum. The respiratory capacity of the irradiated lung is preserved by wide areas of dilated alveoli replacing those which are compressed by the pneumonic exudate. The author believes that this phenomenon, which he calls vicarious emphysema, helps in relieving the animals' dyspnea. Stagnation of blood in the bronchial arteries and in the small veins of the lung is observed in nonirradiated animals, whereas it does not occur in the vessels of the irradiated animals. Consequently cardiac death does not occur. Late irradiation, that given between the eighteenth and twenty-fourth hours after the onset of pneumonia, produces the same effects as early irradiation. However, effects of late irradiation appear more slowly and are moderate. The author concludes that roentgen irradiations have the same therapeutic effects in human pneumonia as in experimental pneumonia. The importance of roentgen therapy in pneumonia is stressed.

Prognosis of Schizophrenia S. Hutter—p 562

**Addiction to Hypnotics**—Sacher discusses addiction to hypnotics obtainable without prescriptions on the basis of 30 clinical cases. He investigated consumption of hypnotics by reviewing the annual sales of an apothecary shop. Hypnotics obtainable without prescription and those obtainable with prescription were sold in a ratio of 10 to 1. Ninety-one per cent of the hypnotics obtainable without prescription were barbituric acid derivatives, while 9 per cent were urea bromide derivatives. The hypnotic most often responsible for addiction was cyclo-

barbital (17 of the 30 cases), two other hypnotics sold in almost as great or even larger amounts had caused only 1 case each of addiction. Barbituric acid derivatives obtainable without prescription became important as causes of addiction soon after the new and more strict narcotics law was enacted in 1931. Many of the former morphine addicts used these hypnotics as substitutes. Cyclobarbital is of especial importance not only because it was responsible for the largest number of addictions but also because it has a high tolerance. The symptoms of intoxication caused by cyclobarbital are the same as those caused by other barbituric acid derivatives. The majority of the patients had nystagmus, reduction of pupillary reflexes, Romberg's phenomenon, pyramidal symptoms, coarse tremors and scanning speech. Sudden withdrawal of cyclobarbital often leads to severe states of agitation with aggressiveness and unstable moods, euphoria alternates with depression and anxiety. There is a tendency to lying and cheating. In contradistinction to cyclobarbital, the other hypnotics obtainable without prescription were often indiscriminately changed by the addicts or were combined with morphine derivatives. The doses used were generally much lower, and psychosis or epileptic attacks were never observed. All of the addicts were mental workers and a considerable number had some connection with the medical profession or the drug trade. The prognosis of the addiction to these hypnotics is unfavorable because a large portion of the patients have relapses. In 1940 prescription became obligatory for all hypnotics which contain barbituric acid derivatives, whereas the urea bromide derivatives (carbromal, abrisin, bromural) are still obtainable without prescription.

**Chemoprophylaxis of Gas Gangrene**—Schreus and Pelzer tested 17 specimens of garden soil and 3 dust samples according to Friedrich's technique for their capacity to produce gas gangrene or tetanus. Eleven of the 17 soil specimens and the 3 dust samples did not cause fatal gas gangrene in inoculated animals, and 10 of these also failed to produce tetanus. More detailed experiments with 6 other soil specimens corroborated Friedrich's observations. The time limit for the possibility of surgical sterilization is six hours, in less infective soil specimens it may be extended to nine hours. The death time likewise is a suitable indicator of infectiousness of specimens. Even in moderately infectious soils the death time is less than sixty hours. Animals which outlive sixty hours often die of tetanus. It can be assumed that these animals like those which survive completely, escape the gas gangrene infection. The authors conclude that the frequently expressed opinions about the favorable results of Friedrich's experiments beyond the six hour limit can be explained by the fact that of the many wounded only a small percentage are threatened by really infectious soils. The ostensible prevention of edema by late excision is probably a deception. In war as well as in peace, conditions for the development of gas gangrene infection are rarely as favorable as under the conditions of Friedrich's animal experiments. The animals which were tested repeatedly showed no great difference in the infectiousness for tetanus and gas gangrene.

**Improvement of Heat Tolerance**—Schlegel's studies on the influence of adrenal cortex extract on heat caused by heat. The effects observed were (1) an increase in the elimination of water by the skin, (2) a decrease in the increase in the cutaneous elimination of sodium chloride, (3) a stabilization of the circulation with alleviation of subjective complaints. The point of attack of the adrenal cortex extract is in the circulation.

extract seems to be chiefly the myocardium. The author classifies the heat disorders into heat exhaustion, heat stroke and heat convulsion but admits that these frequently overlap. In heat exhaustion in which the circulation is impaired but in which the physical heat regulation is still intact or only slightly damaged, the prophylactic administration of the extract stabilizes the circulation and prevents collapse. The organism, thus protected against heat exhaustion, is in danger of heat stroke if it is further exposed to heat and its heat regulation is inadequate. Heat stroke results from the failure of the physical heat regulation and the considerable increase in temperature accompanying it. The adrenal cortex extract acts by maintaining the physical heat regulation through increased and prolonged sweating. It is essential that the sweat shall evaporate and that its heat regulatory function shall not be nullified by high moisture content of the air. The third form of heat disorder, heat convulsion, threatens persons with intact circulation and good physical heat regulation who are protected against heat exhaustion as well as heat stroke. These are persons who by training have become accustomed to working in hot surroundings. As a result of profuse sweating their water and particularly sodium chloride supplies become depleted and the sodium chloride deficiency brings on the danger of heat convulsion. Here adrenal cortex extract is undesirable because it would favor sodium chloride depletion. The most effective prophylaxis here is an adequate filling of the body depots with water and sodium chloride. Heat convulsion may be accompanied by circulatory symptoms characteristic of heat exhaustion; for this reason administration of adrenal cortex extract may be desirable. In general simultaneous administration of adrenal cortex extract and of water with sodium chloride will not have undesirable results. Since the administration of the extract by injection is not practical for large groups, attempts have been made with oral administration but these have so far failed. Dextrose, phosphoric acid compounds, pervitin (synthetic amine related to ephedrine) and kola could be tested for their effect on the heat impaired body. Ascorbic acid could be tried not only because of its strengthening effect but also because the adrenal cortex has an extraordinary high vitamin C content.

Treatment of Cystitis and Pyelitis by General Practitioner H. Weber—p. 22  
\*Chronic Manganese Poisoning and Its Management H. Gärtner—p. 25

**Chronic Manganese Poisoning**—Gärtner lists pyrolusite, manganite, braunite, hausmannite and manganese spar as some of the ores from which manganese is obtained. With comparatively primitive methods of mining manganese poisoning is rare, but in mines in which pneumatic drills are used considerable amounts of dust are produced and the incidence of poisoning is higher. Manganese is used chiefly in the steel industry but also in the chemical, ceramic, glass, dye and varnish industries and in electrotechnics. Cases of poisoning may occur whenever manganese is handled and particularly when manganese dust is produced. Exposure to the dust alone is not sufficient, because with the same exposure only a part of the workers develop symptoms of poisoning. Persons with chronic inflammation of the respiratory passages are particularly vulnerable. The filter capacity of the nose is another important factor. Manganese enters the organism chiefly through the respiratory passages, although swallowed manganese is also of importance. The metal is eliminated in the urine and particularly in the feces but only after a certain amount of it has been stored in the liver and the kidneys. The symptoms of manganese poisoning are caused by a chronic involvement of the central nervous system. There is impairment in walking, the so-called rooster step, difficulty in bicycle riding and dancing, spilling of fluids while eating and a tendency for the handwriting to become smaller. There may be tremor, adiadochokinesis, salivation and

compulsive laughter or crying. Impairment of potency and lack of libido are characteristic. Prognosis is favorable for life but very unfavorable for restoration of health. Chronic manganese poisoning also produces thyrotoxic disturbances or the course may resemble that of a progressive bulbar paralysis or of amyotrophic lateral sclerosis. There may be pyramidal symptoms. Hepatic lesions, joint disorders, thirst, hunger, glycosuria, increased basal metabolism and vasomotor disturbances have been observed. Resemblance to postencephalitic parkinsonism is close. The latter as well as multiple sclerosis, Wilson's disease (progressive lenticular degeneration) and arsenical poisoning must be considered in the differential diagnosis. A history of exposure to manganese is important. The treatment is chiefly symptomatic. Pneumonia is rather frequent among manganese workers and has a high mortality rate. Because of the inadequacy of treatment, preventive measures are important. These include devices to eliminate manganese dust, frequent change of the workers, careful selection of workers (exclusion of those with signs of thyrotoxicosis and with irritability of the respiratory passages) and efforts to detect the first symptoms by examinations at short intervals.

\*Etiology and Diagnosis of Dysentery in Young Children S. S. Kazarnovskaya and O. I. Solov'eva—p. 254  
\*Clinical Aspects of Chronic Dysentery M. A. Neyman—p. 266  
Work of Dispensaries in Detection of Chronic Dysentery E. M. Novgorodskaya, S. I. Iter, O. I. Solov'eva and G. M. Goldberg—p. 270

**Dysentery in Young Children**—Kazarnovskaya and Solov'eva maintain that acute diarrhea in children clinically diagnosed as hemorrhagic colitis, is in reality dysentery. By examination of feces during the first few days of illness and by multiple cultures, dysentery bacilli may be demonstrated in practically all cases of hemorrhagic colitis. The authors emphasize the necessity of comparing the results of the bacteriologic and coprologic examinations before deciding that a patient has ceased to be a carrier and may be safely sent home. Because of imperfections of present day bacteriologic technique, a bacteriologic examination alone is not sufficient. Their findings indicate that only 65.4 per cent of children are free from dysentery bacilli after three weeks (the average duration of the dysenteric process in young children), while 34.6 per cent continue to excrete bacilli much longer. They point out the difficulty of differential diagnosis between toxic dyspepsia and dysentery in young children, when the dysenteric process appears in the form of enteritis with signs of toxicosis. The term "summer diarrhea" has been applied to diseases of different etiology and different epidemiologic significance. By means of the coprologic examination a rapid and early diagnosis is possible in cases of acute infantile diarrhea. The simplicity of this method makes it especially suitable for dispensary practice.

**Clinical Aspects of Chronic Dysentery**—Neyman's studies are based on prolonged observations of 751 persons with acute dysentery in 1938. Excretion of dysentery bacilli was demonstrated in 44 (8.7 per cent) of 502 persons examined bacteriologically. The majority of these presented certain definite clinical symptoms which made possible the diagnosis of chronic dysentery. The most constant clinical sign was the syndrome of distal colitis. There was a tendency to recurrence with appearance of blood, mucus and pus in the feces. The clinical course of patients excreting Shiga bacilli was different from those excreting Flexner bacilli. The author stresses the value of a bacteriologic examination of feces in patients with gastrointestinal complaints who present a history of acute dysentery even though negative findings do not in themselves exclude the possibility of chronic dysentery. Among factors concerned in the transition from acute dysentery into the chronic form, the author lists the nature and course of the acute process, the patient's constitution and chronic gastrointestinal disease preceding the acute dysentery. At present only severe and typical forms of chronic dysentery can be diagnosed while the milder, atypical forms offer diagnostic difficulties which require further study.

## Book Notices

**Anæsthetics Afloat** By Surgeon Lieutenant Commander Ronald Woolmer R N V R, B A, B M. Anæsthetic Specialist R N Medical Service With an Introduction by Surgeon Captain R D Drennan D S O, R N. Cloth. Price, 6s. Pp 120, with 18 illustrations. London H K Lewis & Co, Ltd, 1942

The author has prepared a brief and truly pocket size treatise dealing with the administration of anæsthetics on board ship. Obviously space is lacking on one hundred small pages to include more than the bare essentials of practical instruction. Selection of what is "essential" for inclusion has been made with judgment. Illustrative of this judgment, the four pages devoted to examination of the patient cover only the points which have a direct bearing on danger and difficulties in anæsthetic administration. For example, he says "It is annoying to realize the inaccessibility of superficial veins in the fat Stoker Petty Officer type only after one has decided upon intravenous anæsthesia, with the syringe in hand and the patient on the table." The advantages of spinal and block anæsthesia are rightly stressed, yet the author states that "for the maintenance of inhalation anæsthesia on board ship, 'open ether' is the only practical method." The criteria of the stages of anæsthesia differ from those usually accepted by anæsthetists; the disappearance of the laryngeal reflex is not usually regarded as a sign of the onset of surgical anæsthesia, and the author defines as the "fourth stage" what is commonly regarded as the fourth plane of the third stage. Chapters XI and XII are the most interesting part of the book. These deal with the problems of anæsthesia during and immediately after a naval action, and the author's views are evidence of a rare combination of humanity, clinical judgment and common sense.

As a specialist in anæsthesia and a naval officer, Mr Woolmer writes from first hand experience. His book should be read by any medical man who may have occasion to act as an anæsthetist on board a ship.

**Industrial Surgery Principles, Problems and Practice** By Willis W Lasher M D, F A C S. Assistant Professor of Traumatic Surgery, New York Post-Graduate Medical School Columbia University, New York. With a foreword by Charles Gordon Heyd M D. Enlarged first edition. Cloth. Price, \$6.50. Pp 472, with 194 illustrations. New York & London Paul B Hoeber Inc, 1942

This is published at a time when the number of persons treated by industrial surgeons is at an all time high. Additions have been made throughout. The basic format has not been materially altered, except for additions of new material and methods. Two chapters have been added: one on strains and sprains, which repeats portions of the book which bear repetition, and one on chemotherapy and dehydration, which is rather sketchy. The author's premise that industrial surgery will be recognized as an independent specialty is one that will probably not be generally accepted. Though there are many problems peculiar to compensable injuries, the physiopathologic changes are similar and their interpretations are for the most part not much different than in any other injuries. The book is well written and fairly well illustrated. Though inclusive, several sections are rather brief. It is a good guide for the many general surgeons who are entering the industrial field at this time.

**Clinical Endocrinology** By Samuel A Loewenberg M D, F A C P. Clinical Professor of Medicine Jefferson Medical College, Philadelphia. Foreword by Hobart A Reimann M D. Professor of Medicine and Clinical Medicine Jefferson Medical College. Second edition. Fabrikoid. Price, \$8. Pp 883, with 194 illustrations. Philadelphia F A Davis Company, 1941

This volume is written in the classic form of medical textbooks and presents a vast amount of well organized information concerning each of the endocrine glands and the clinical aspects of diseases involving those glands. The book is heavily and well illustrated, and it has clearly been written to represent a complete textbook of endocrinology with information on the diagnosis and treatment as well as the underlying physiology and pathology of all endocrine diseases. Unfortunately the book falls short of this goal in a good many important respects.

In the division of space, the thymus and pineal glands have been allowed fifty-five and twenty-four pages respectively, while the male gonads and parathyroids occupy only thirty-six and fifty-five pages. Thus there appears to be an over-emphasis of the former pair, about which, from the clinical point of view, almost nothing is known. But the curtailment of discussion of the latter two is even more regrettable because of their relative importance. The pituitary rightfully receives the largest allotment of space—one hundred and sixty-two pages. In dealing with a field which has become, even in its clinical aspects, largely chemical and physiologic, the author's approach has remained largely descriptive. The sections concerned with physiology and chemistry are brief and superficial and can hardly be considered up to date. The chapter on the thyroid gland is a good example of this criticism. All the splendid recent contributions on the metabolism of iodine and iodoproteins and their application to the present changing concept of thyroid disease have not been included. Two pages of the one hundred and eleven devoted to the subject are concerned with thyroid physiology. Unusual emphasis has been placed on the differentiation between toxic adenoma and exophthalmic goitre, a distinction which physiologic studies are showing to be of less and less importance. Finally, and perhaps most important, inadequate attention has been paid to the multitude of clinical problems interrelated with thyroid disease, such as nutrition, calcium metabolism and cardiovascular aspects. Many of the same criticisms are equally applicable to the sections dealing with the adrenal glands and the gonads, both male and female. An abundance of physiologic material has been omitted. Nothing is mentioned concerning the qualitative differences between the various adrenal steroids and the interesting correlation between their chemical structures and physiological actions. The brilliant contributions relative to the 17 ketosteroid compounds are not presented, thereby seriously detracting from discussions of the gonads and adrenals. Chapters 13, 14 and 15 contain summary material including laboratory tests, an outline of common endocrinopathies and a list of available endocrine products. Many readers will disagree individually on many of these details, such as, for example, the recommendation of whole anterior pituitary substance orally and the use of whole ovarian substance. The dominant criticism of this volume, however, is its failure to provide the necessary basis of pathologic physiology of endocrine diseases which is an indispensable prerequisite of any treatise of clinical endocrinology at the present time.

**Self Analysis** By Karen Horney, M D. Cloth. Price, \$3. Pp 128. New York W W Norton & Company, Inc, 1942

This book is based on a series of lectures delivered to laymen at the New York School for Social Research in New York City. On page 7 the author says "There is little actual experience to serve as guide, my purpose has been merely to raise the issue rather than to offer any clearcut answer." Again on page 28 she says "To what extent self analysis is possible without previous experience (that is, previous experience as a patient in a professionally guided analysis) must be left an open question." Under these circumstances the title of the book and the statements in the advertising matter are grossly misleading. They imply that the book presents a technique of analysis which is available to any and every one, whereas it is based exclusively on longer or shorter periods of self-analysis during the course of a regularly conducted psychoanalytic analysis. Why then is it presented to laymen at all? The author acknowledges that the results of her procedure have been subjected to critical clinical tests or to review by interested colleagues? There is a sound medical conviction that nostrums should not be peddled to the public before they have been widely tested by more than one impartial observer. It is wholly indefensible that a book of this kind should be marketed as a popular book and advertised with a "money-back-guarantee" completely satisfied" coupon, and as a "practical" step by step outline to guide the layman in this procedure. This is "patent medicine" advertising and a shock to the system from reputable procedure on the part of both the author and the publisher.

Furthermore, the material dealt with in the book should have been called "clinical self description" rather than "self analysis." Horney focuses the attention of the reader on the recognition of what she calls "neurotic trends." In her theoretical structure she attributes to neurotic trends a role in the etiology of the neuroses not unlike that which Freud assigns to instinctual drives. Her position, however, is not always consistent, because she also recognizes that these neurotic trends are themselves compulsive neurotic symptoms. In fact these "neurotic" trends of Horney consist of nothing more than a congeries of compulsive, symptomatic, neurotic behavior patterns. They are as compulsive in their nature as is a handwashing compulsion, although they are infinitely more subtle in their manifestations and more difficult to recognize, whether by the patient or by the physician.

Once this simple truth is realized the basic weakness of Horney's system becomes apparent. If a patient has a compulsive demand to receive attention and if the mere absence of a telephone call can throw such a patient into a frenzy of anxiety, it will give rise to a tension state which the patient must either bury in depression or act out blindly in many subtle but compulsive ways. On the other hand if a patient has a handwashing compulsion and is prevented from washing his hands, then he too will be thrown into a state of tension and anxiety. Thus the essence of the two phenomena is the same. Both are familiar, although the latter is less subtle and more easily recognized than the former.

But no psychiatrist or psychotherapist, much less analyst, believes that a compulsion can be cured merely by confronting a patient with the fact that it is a compulsion, or even by a careful description of the interrelations of such symptoms. If the handwasher rationalizes his handwashing and feels that there are special reasons why he must wash his hands so often it is important of course to break down these rationalizations in order to make the compulsive symptom itself more accessible to analysis. But no one for a moment would fool himself into believing that the accurate description of the symptom, or the patient's admission of the fact that it was a symptom, or the patient's abandoning of his rationalizations of his symptoms will put an end to the compulsive necessity which drives the symptom. Honest self description is an essential first step but it constitutes only the antechamber to treatment. This fundamental fact holds true whether one is dealing with an obvious symptom like a handwashing compulsion or one of those subtle, diffuse compulsive patterns of behavior which Horney calls aptly "a neurotic trend." However, in her emotional reaction against analysis Horney calls this process of frank self description "self analysis" and attributes to it a therapeutic leverage which it does not possess. It is of basic importance to realize this.

Furthermore one must register another note of warning. The confrontation of patients with descriptive facts must be carefully dosed. No mistake is more frequently made than the premature confrontation of patients with facts which are difficult to absorb. Horney professes a strange and almost mystical confidence in a patient's capacity to measure his self dosage accurately and safely. This is a strange mistake for an experienced psychiatrist to make, when one contemplates the innumerable ways in which the unguided patient can use truth to his own injury.

So serious are these basic flaws in the book that they seem to the reviewer to outweigh entirely the value of the keen clinical descriptions which Horney as usual is capable of giving. In this book these descriptions are put to a particularly unfortunate use. This reviewer would be as full of praise as he is of criticism if Horney had contented herself with elaborating a description of compulsive behavior patterns and had she then written a series of technical articles on the use of a technique of discontinuous analyses with systematically planned periods of self description interspersed among periods of professionally guided analysis, and had she finally presented to her analytic and psychiatric colleagues a series of patients handled in this way, comparing the results achieved and the duration of treatment with patients treated by currently accepted methods of

continuous professional analysis. Unfortunately, however, Horney has for some years written almost exclusively for the uncritical layman.

There are other flaws in the structure of the book. By omissions and by choosing certain quotations out of their context, Horney builds a distorted picture of the history of psychoanalytic psychiatry. She gives an incorrect picture of Freud's attitude toward the possibilities of self analysis as manifested in his analyses of his own dreams. Indeed, wherever she touches on a point of Freudian theory she distorts it in order to be able to criticize it. To the reviewer this is particularly disturbing, because it is his conviction that Dr. Horney has made certain valuable critical challenges to weak points in analytical theory. Therefore it should be unnecessary for her to distort this theory merely for the sake of target practice. However, this is not the place for a detailed dissection of these criticisms or of the inner details of Horney's system or to contrast it with the Freudian. It is fair to say, however, that before serious consideration can be given to Horney's point of view it must itself be purged of its own manifold and obvious scientific inconsistencies.

*The Treatment of Burns*. By Henry N. Harkins, M.S., M.D., Ph.D. Associate Surgeon, Henry Ford Hospital, Detroit. Cloth. Price \$6.50. Pp. 437 with 117 illustrations. Springfield, Illinois & Baltimore: Charles C. Thomas Publisher, 1942.

[The following part of this book review was inadvertently omitted from *The Journal* July 25 in which the first part appears on page 1061.]

In part II there are chapters covering general treatment and its relation to local treatment, tanning methods of treatment, antiseptics, saline baths, other methods of treatment, early plastic procedures and late plastic reconstruction. In the discussions of local treatment, tannic acid or some modification of the tanning method is given preference. The contraindications and limitations of this method, however, are freely discussed. The advantages of alternate forms of treatment are presented. The importance of careful preliminary cleansing and removal of blisters as a basis for all forms of local therapy is emphasized. The author clearly indicates that the local treatment must be modified to suit the needs of the case and must be carried along with the systemic management in an orderly fashion. He emphasizes the extreme importance of intravenous transfusion, oxygen therapy and other systemic measures in severe burns. The need for blood transfusions in all stages of burn therapy is mentioned. There is a good discussion of the use of blood plasma. The chapter on early plastic surgical procedure is good. The author emphasizes the importance of early skin grafting on large granulating surfaces and gives detailed discussion of skin grafting methods. He makes the point that very thin Thiersch grafts do not give good results. Thick Ollier-Thiersch grafts, however, which the author calls small thick split grafts will when properly cut and laid on good granulation tissue give a satisfactory result in most cases. They have the advantage of producing little or no mutilation of the donor site. The chapter on the late plastic treatment of burn defects is brief but fundamentally sound.

In part III the author gives a short chapter on the special features in burns of the scalp, eyes, face, hands and other areas of the body of unusual significance. There are also chapters on electrical and radian burn, chemical burns and freezing.

Brief biographical sketches of the lives of Dupuytren, Curling, Underhill and Davidson are included as interesting historical features. Photographs and illustrations are excellent.

The author obviously has not written this book primarily for readers who wish to be told in a few words exactly how to treat burns. There is, however, a final chapter giving a practical outline for treatment. Dr. Harkins's book stands as the best available guide to the successful management of the severely burned patient. As the author states in the preface, the question of burn therapy is at the crossroads, and a decision as to the best type of local treatment may be reached in the near future. It is gratifying that he makes no effort to close the subject. As an aid and inspiration to further study and progress, the book is most valuable. With suitable revision it may stand as a masterpiece.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### FOLLICULITIS IN BRASS PLATING WORKERS

To the Editor—A new plating operation has been installed, and I have been confronted with a series of workmen suffering from pustular eruptions surrounding the hair follicles on forearms, wrists and hands, also any slight scratches in these regions become acutely inflamed with a tendency to infection. The face is seldom attacked, occasional nausea and epistaxis occur. The following materials are used in conjunction with the brass plating equipment. The process is outlined in the sequence of operation. All operators wear rubber gauntlet type gloves with coverall sleeves down to the wrists, inside the gauntlets. The cycle of operation is fully automatic and operators do not immerse their hands in any of the solutions. Cleaning 1 Sun T Mineral Oil (Sunoca Company) 2 International A B Cleaner (caustic trisodium phosphate) 3 Muriatic acid 4 Sodium cyanide, sodium hydroxide solution. Plating solution 5 Sodium cyanide, copper cyanide, zinc cyanide, sodium carbonate (possibility of very slight ammonia fumes involved in the process) Rinsing 6 Concentrated lubricating soap solution 7 Sawdust. Heavy duty fans exhaust the bulk of the fumes. It seems to me that the heavy rubber gauntlet gloves worn tend to aid in the production of this condition as a result of perspiration. I have used sulfathiazole-sulfanilamide ointment with good results. My question is for some means of preventing this condition and the possibility of better treatment.

M D, Ohio

ANSWER—From the description given, the condition on the hands and arms and wrists of these men is a folliculitis, probably a low grade pyogenic affair, perhaps from *Staphylococcus aureus* or *albus* or both. It is to be noted that the operators wear rubber gauntlet gloves and that their sleeves come down to the wrists inside the gauntlets. Presumably the gauntlets cover up to the middle of the forearm, so that perhaps part of the forearm affected is outside the gauntlet area. It is also noted that the operators do not immerse their hands in any of the solutions, but it would seem possible that some of the oil and other solutions might be splashed onto the coverall sleeves unless the operation is an entirely enclosed one. The oil and the alkali might perfectly well be factors in the causation of such an eruption, and the retention of perspiration by rubber gloves for an eight hour working period constitutes another hazard.

It is perhaps not feasible to dry clean-sterilize these coverall sleeves and sterilize the rubber gloves if there are many workmen. At the same time, without knowing more of the process, it would still seem advisable to continue with the coverall and glove protection rather than expose the bare skin. It would seem advisable to make use of a permanganate solution, 1 5,000, and even 1 3,000, for the immersion of hands previous to the beginning of each work period, perhaps allowing the solution to dry on before putting the hands into the gloves. Some such solution might reduce the surface bacteria and lessen the perspiration and maceration to a certain extent.

As far as actual therapy is concerned, if the sulfathiazole-sulfanilamide ointment is producing good results it would be best to continue with it for the present. As an alternate, a 4 per cent ammoniated mercury in boric ointment could be used. If any selection of employees is possible, it would seem advisable to transfer those who develop such an eruption to other work and replace them with individuals who might well have a more highly developed immunity to such organisms.

### ERYTHEMA NODOSUM AND OCCUPATION

To the Editor—A patient working in the Celon Company comes in contact with triethanolamine, glycerin, acetic acid, caustic soda, hydrogen peroxide, beta-naphthol, AS naphthol and formaldehyde. I should like to know if any of these have ever been known to produce the clinical entity known as erythema nodosum, which was characterized by pain in his hips, fever, and varicolored nodules on his tibial surfaces.

G J Maloof, M D, Madison, Wis

ANSWER—The etiology of erythema nodosum, albeit obscure, sharply points away from industrial causes and instead to infection or the influence of infection, notably tuberculosis, syphilis, rheumatic fever and mycoses. By some, erythema nodosum is regarded as only a form of erythema multiforme. Of this Johnstone states "The physician should recognize that such skin disorders as erythema multiforme are practically never related to occupation." Although erythema nodosum

has been linked with drug action, including iodides and bromides, these substances when constituting the possible offender were used therapeutically. Numerous factors connected with erythema nodosum militate against any industrial origin. Some such factors are the following.

Erythema nodosum occurs more frequently among women industrially employed than among industrially employed male. The site of the cutaneous lesions do not conform to that commonly associated with occupational dermatitis. Erythema nodosum commonly is ushered in by constitutional features suggestive of infection. The cutaneous lesions appear to develop deep in the integument, which is contrary to the occurrence of most contact dermatoses. One attack appears to confer immunity, or at least some resistance, which would be unlikely in the event of continued or resumed exposure to some industrial substance suspected as the cause.

Of the several chemicals mentioned, all are capable of inducing dermatoses under some circumstances, but not the type here described. Formaldehyde in particular may lead to an erythema but is not known to lead to an erythema nodosum. While disbelieving that this described erythema nodosum may represent any characteristic occupational disease, one may grant that many types of unfavorable work conditions, and particularly excessive wetness, might constitute a contributing factor to such cutaneous lesions.

### CONTROL OF PAIN WITH COMBINED MORPHINE AND CODEINE

To the Editor—A woman aged 47 has been bedridden for twenty-three years with arthritis deformans. She presents a textbook picture of arthritis deformans, and this is exceedingly painful. She cannot bear the pressure of the bedclothing on her feet. She has run the gamut of treatment from salicylates to lights of all sorts, injections of almost everything, diathermy, all with no results. It was necessary to give her morphine for her pain. The dose has never been increased for twenty-three years and is sufficient to ease her pain. Two prescriptions are being given: (1) morphine sulfate 10 grains (0.65 Gm) and compound elixir of pepsin 4 ounces (120 cc), elixir Lactopeptine 4 ounces (2) codeine sulfate 13 grains and compound elixir of pepsin 4 ounces. Roughly she gets 1 1/2 grains (0.007 Gm) of morphine sulfate and 1/4 grain (0.016 Gm) of codeine sulfate in each dose for four doses a day of the mixture of the two. This dose has never for twenty-three years been increased or decreased. At the night she is given one 1/4 grain tablet of scopolamine, and codeine morphine by hypodermic. She is an addict through necessity. She has never had nausea or any of the symptoms of morphine poisoning. Her pupils are contracted. There is no constipation, nor does there seem to be a craving for the drugs, perhaps because her medicine is always given on time. Yet in between doses there is no craving, no loss of appetite, and elimination is normal. In carcinoma, tuberculosis and other incurable diseases, once you start morphine therapy, you have to increase the dose constantly. But in this case 1/2 grain of morphine sulfate and 1/4 grain of codeine sulfate appears to have been sufficient for twenty-three years. Is there anything in the combination of morphine sulfate and codeine sulfate that will lessen the craving for the narcotics and get away with the unfavorable results of morphine sulfate and codeine sulfate when taken separately?

M D, New York

ANSWER—Since the inquirer points out that the prescription containing morphine and codeine sulfate (which is given four times a day) would supply a total daily dose of approximately 1/2 grain of morphine sulfate and 1 grain of codeine sulfate (which is supplemented with an additional 1/4 grain of morphine sulfate at bed time), which has not varied over a period of twenty-three years, it is not surprising that addiction to opiates has resulted. The fact that the patient has had a craving is also not surprising in view of the regularity with which the prescription has been administered. Tolerance does not occur uniformly to all the manifestations of morphine action but occurs only with the depressant effects on the nervous system—analgesia and stupefaction. Tolerance does not occur to the excitatory responses elicited by the opium alkaloids. Thus the true addict may continue to obtain stimulation without increase in the dosage, even though the depressant analgesic effects are lessened if the dosage is not increased. Cross tolerance also exists between the various pharmacological alkaloids of opium, so that a person tolerant to morphine is also tolerant to dihydric, codeine and heroin. Addiction to codeine occurs, and addicts to this alkaloid experience stimulation, although it is well known that this alkaloid lacks the addicting property in the same doses required for morphine. In view of the fact that the patient has had arthritis deformans for many years and is now well beyond the acute stage of the disease, the pain factor was probably more intense, it seems likely that the same dose of morphine and codeine sulfate would be sufficient to allay her craving for the stimulant effects of the narcotics (to which tolerance has not developed), so that the depressant effects (to which tolerance does occur) are no longer needed to make the patient comfortable. This seems the most reasonable

explanation. However, the inquirer can determine more accurately the need for continuing the morphine and codeine prescription by gradually decreasing the dose and by eventually substituting a placebo or another analgesic if this is necessary. There is no evidence to support the view that a combination of morphine and codeine sulfate is less habit forming than morphine alone if doses are adjusted to supply equivalent analgesic effects for example, by subcutaneous injection 64 mg of codeine sulfate is required to produce the same analgesic effect as 10 mg of morphine sulfate.

### SUN PAIN' IN CHRONIC MALARIA

*To the Editor*—Is there such a thing as sun pain, i. e. headache for a period of twenty days due solely to malaria without a history of chills and fever and without temperature in excess of normal at the time of pain?

M D West Virginia

*ANSWER*—Yes. Malaria in the atypical chronic form may be considered as one of the possible causes of the persistent headache following exposure to the activating influence of the sun's rays.

The symptoms as related in the query, however, do not present distinguishing characteristics of malaria, in contrast with many other chronic conditions such as refractive errors, vitamin deficiencies, reflex disturbances and focal infections.

If in this case there occurred periodic abrupt seizures beginning near midday or definite exacerbations of the symptoms reported as following exposure to the sun, with tertiary or with 'septenary' (seven day) periodicity, the case would suggest strongly a cerebral (perhaps ocular) malaria.

A diagnosis of malaria in such cases may sometimes be made by employing a therapeutic test consisting in administration of specific remedies. Symptomatic control may be obtained by prolonged follow-up treatment consistent with the persistent relapsing nature of the disease. References

### PERSISTENT POSITIVE SEROLOGIC REACTION IN A SYPHILITIC PATIENT SENSITIVE TO ARSENICALS

*To the Editor*—In 1937 a woman aged 48 was found to have a positive Kahn reaction. Nine months previously she had had a severe sore throat which lasted five days. There had been no history of a primary lesion or cutaneous rash. She was given six doses of bismuth subsalicylate in oil at weekly intervals followed by one dose of 0.3 Gm of neosarsphenamine and a second dose of 0.6 Gm four days later. She developed salmon colored scaly skin lesions varying in size from 1 to 3 cm in diameter on all parts of the body. It was necessary to stop all treatment for four weeks. She was then given 1 cc of bismuth subsalicylate in oil each week for sixteen months accompanied by potassium iodide orally. During this time several attempts were made to use neosarsphenamine, sulfarsphenamine and mapharsen later on both with and without 400 mg of ascorbic acid daily a dermatitis being produced each time they were tried. During March and April 1939 she received injections of mercury elsewhere. From May 1939 to January 1940 she was given weekly doses of the bismuth compound. Treatment was stopped during 1940. Because of the development of induration in the lower part of the rectum treatment was resumed in February 1941 and has been continuous since that time. Bismuth subsalicylate, thiobismol and iodothiobismol have been used. The soluble bismuth preparations were given twice each week. The Kahn test has been positive at all times. The spinal fluid taken recently contained four cells there was no increase of globulin the calloidol gold curve was normal and the Kahn reaction was negative. Fluoroscopy shows no aneurysm. There is no evidence of skeletal involvement. There are no neurologic signs. It seems to me that this patient has received a more than adequate amount of bismuth and iodides. What further treatment should be given? Can you suggest any procedure by which the serologic test can be reversed? Is the persistence of a positive Kahn reaction in the absence of anything else of any importance?

M D Colorado

*ANSWER*—This patient, according to the data furnished has received more than one hundred injections of bismuth preparations. In view of her sensitivity to arsenic, her age, the negative spinal fluid examination, the negative cardiovascular check and the fact that she is otherwise asymptomatic, there are two courses to pursue. (1) Discontinue treatment entirely and place her on parole checking her once a year, or (2) give two courses of insoluble bismuth a year for the next two years, giving twelve injections to the course.

The persistence of the positive serologic test in itself has no special significance. However, it is advisable to observe the patient for several years longer to make certain that she remains asymptomatic. There is no special treatment that will assuredly reverse the serologic reaction in patients with latent syphilis.

### DETERMINATION OF THE DATE OF OVULATION BY AN ELECTRIC POTENTIOMETER

*To the Editor*—In J P Greenhill's *Office Gynecology*, third edition page 157 I read that with the help of the electric potentiometer one can determine accurately the date of ovulation. Could you please verify this statement and give me details of the technique used?

A L de Guevara MD Guadalajara, Jalisco Mexico

*ANSWER*—Burr, Hill and Allen (*Proc Soc Exper Biol & Med* 33 109 [Oct] 1935) reported that with ovulation in the rabbit there was an increase in the difference in potentials between two electrodes, one placed above the symphysis and the other in the vagina. Reboul, Friedgood and Davis (*Am J Physiol* 119 387 [July] 1937) claimed that this change in biopotentials was synchronous with ovulation. Burr, Musselman, Barton and Kelly (*Science* 86 312 [Oct 1] 1937) reported the same phenomenon in a woman as did Rock, Reboul and Wiggers (*New England J Med* 217 654 [Oct 21] 1937). Barton (*Yale J Biol & Med* 12 335 [March] 1940) claimed that wide changes in the difference of potentials between two index fingers indicated ovulation, but Rock (*New England J Med* 225 910 [Dec 4] 1941) maintains that "finger to finger potentials" have no relation whatever to ovulation. Rock believes that like basal body temperatures and vaginal smears, biopotentials may be affected by ovulation but not in such a critically peculiar way as to indicate ovulation and therefore, like other methods, cannot be used clinically to detect this significant event.

An illustration of the apparatus used in making a bioelectric record and the technique of the procedure may be found in an article by Burr, Musselman, Barton and Kelly (*Yale J Biol & Med* 10 155 [Dec] 1937).

### ROUTINE SEROLOGIC TESTS IN HOSPITALS

*To the Editor*—What is the advisability of making routine blood Kahn or Kline tests on all patients including private obstetric medical, surgical and pediatric? Are hospitals running routine Kahn tests on private patients or waiting until individual physicians order them?

Sister Ann Superintendent, St Mary's Hospital Detroit

*ANSWER*—The use of serologic tests routinely on all hospital admissions has during late years become common practice. At the University of Michigan Hospital, for example, a Kahn test is part of the registration of all patients, including private, in all the services both inpatients and outpatients. Blood specimens, obtained when the patients register, are sent directly to the serologic laboratory and the results are reported by the laboratory to the respective services in which the patients seek medical or surgical aid. In accordance with this plan, physicians are able to have the serologic reports on their patients at the time of the examination.

In some hospitals, blood testing is part of routine hospital procedure on all patients actually admitted to the hospital. In isolated instances in which a patient objects to having a blood test the matter is left to his physician.

The tendency during late years has been to extend the use of blood tests in private and hospital practice. This fact alone would indicate that physicians desire to have a serologic report as part of the medical record of each of their patients.

### THE RELATIVE VALUE OF SULFONAMIDES IN STREPTOCOCCIC INFECTIONS

*To the Editor*—Will you please tell me the value of sulfathiazole and also sulfadiazine as compared with sulfanilamide in the treatment of streptococcal infections? I understand that sulfathiazole and sulfadiazine are probably better for pneumococcal infections than the sulfanilamide but what is the comparative value of the three preparations for streptococcal infections?

M D Mississippi

*ANSWER*—It is still too soon to evaluate the relative merits of various sulfonamide drugs in different types of infections. In general, however, sulfanilamide is the first choice of many experienced observers for the treatment of streptococcal infections. (Lockwood, J S. Sulfanilamide in Surgical Infections, *THE JOURNAL*, Oct 5, 1940, p 1190. Chemotherapy for Infectious Diseases and Other Infections *ibid* Feb 8, 1941, p 513. Long, P H. *Bull New York Acad Med* 16 732 [Dec] 1940). Sulfathiazole, while appearing to have considerable value in staphylococcal infections, does not seem to be as effective in streptococcal infections, although Epstein found it effective in streptococcal impetigo (Epstein, Stephan. Impetigo Contagiosa *Wiscconsin M J* 40 383 [May] 1941). Not enough reports are in as yet to determine the efficacy of sulfadiazine in streptococcal infections.

### PARAESTHESIA OF SENSE OF TASTE AFTER TONSILLECTOMY

*To the Editor*—Following tonsillectomy under general anesthesia a patient developed a shaggy patch in the center of the tongue and disturbances and diminution of the sense of taste. A neurologist tells me that it would be impossible to cut the nerves of taste during a tonsillectomy. Would traction on the tongue be the probable cause of this damage to the lingual nerves?

R. P. Little, M.D., New York

**ANSWER**—Tonsillectomy may be followed by a variety of disturbances in sensation affecting the tongue and pharynx, among which one occasionally observes a paresthesia of the sense of taste. It is more than likely that the cause lies not in any damage to the lingual nerve but rather to fibers of the glossopharyngeal since these supply the posterior third of the tongue with the special sense of taste in addition to supplying sensory fibers to a good portion of the operative field. Also trophic disturbances have been observed as the result of damage to the sympathetic fibers. Most of these paresthesias disappear in time, since the damaged fibers usually regenerate. If the postoperative scarring is extensive, the ultimate recovery may be long delayed.

### PTYALISM IN INFANT

*To the Editor*—A boy aged 1 year, who is tongue tied, has hyperfunction of the salivary glands while awake but not at night. The bibs are copiously saturated throughout the day. He has nine teeth and a good appetite, and he takes vitamins A, B, C, and D. Please give me your opinion and suggestions.

L. P. Diehl, M.D., Woodsfield, Ohio

**ANSWER**—Hypersecretion, or ptyalism, results from a wide variety of conditions, such as teething, inflammatory conditions of the mouth and throat, cretinism and idiocy, poisoning especially that of mercury, and functional nervous disturbances. In other instances there is only an apparent increase because the saliva is not swallowed. In the case mentioned the tongue tie has no influence. As the infant is apparently normal and healthy and does not have the difficulty at night, it might be presumed that the baby does not swallow its saliva when awake, allowing the excess to drool out of his mouth.

If the condition becomes very troublesome, atropine in therapeutic doses for an infant 1 year of age, administered several times during the day, may diminish the secretion of saliva.

### POSSIBLE BUEGER'S DISEASE

*To the Editor*—A man aged 36 noted five years ago a small round red spot on the calf of the right leg over one of the veins. This progressed slowly over the leg in the course of many months. He was given various forms of treatment without relief. The condition extended above the knee. Ligation of the saphenous vein was done, after which red spots broke out in a number of points over the entire leg, including the thigh. One spot appeared about the point of ligation, and another vein was ligated. The process was stationary until about three months ago, at which time a similar spot appeared on the other leg, anteriorly just below the knee. This progressed down a vein almost to the ankle, then struck an anastomosis and started up the anastomosing branch, it progresses about 1 inch (2.5 cm.) in ten days. It never gets very sore, there is never much swelling, and thrombosis seems to occur behind it, but complete healing with complete disappearance of any abnormality occurs within ten days to two weeks behind the progressing spot of redness. Wearing a pressure bandage has helped some. Attempts have been made to produce thrombosis of the involved vein ahead of the site of the inflammation but have not been successful. This condition seems to be a progressive phlebothrombosis. There is no evidence of endarteritis. Is the condition likely to involve the end arteries? What treatment should be given?

Duncan C. McKeever, M.D., Houston, Texas

**ANSWER**—A young man with migrating phlebitis should always be suspected of having Buerger's disease. Even if all the arteries of the foot are pulsating, excessive sweating, early myocardial damage and the absence of one of the radial pulses may point to a more general vascular involvement. The sedimentation rate and the coagulation time should be investigated to estimate the activity of the process and the possibly increased tendency to thrombosis.

Smoking should be absolutely forbidden. Adequate salt and water intake must be maintained. Twelve injections of sodium thiosulfate, given twice weekly, often help the disappearance of phlebitic patches. Obvious foci of infection should be eradicated. Heparin can be administered during the acute attacks. Even so, the phlebitic process may spread gradually into the arterial tree. It would be wise to obtain the help and advice of a consultant in vascular disease, as patients with the condition may have thrombi in various viscera and sometimes die of pulmonary embolism.

### UNUSUAL REACTION TO SHORT WAVE EXPOSURE

*To the Editor*—A young healthy white man who was exposed to the radiation from uncovered aerial feeders of an ultra high frequency transmitter of approximately 25 meter wavelength for about five minutes complained of a feeling of numbness all over his body. He also felt chilled as if he were drunk. The numbness and chilliness disappeared immediately after cessation of exposure, the feeling of inebriation took from a third to three quarters of an hour to wear off. Are there any records of similar reactions to ultra high frequency radiations?

M.D., New York

**ANSWER**—As far as can be determined, there is no report of similar reactions by persons exposed to radiation of extremely short wavelengths. Some observers have reported unusual symptoms in persons who were exposed to short radio waves of 6 meter wavelength or longer, but for the most part these observations have not been confirmed elsewhere. Schlophake mentioned that persons who remain for a long time in a short wave diathermy field may be subject to certain disturbances of the nervous system, which he listed as "a desire to sleep," "a high degree of enervation and prostration," "intense headaches" and "digestive disturbances." Krusen stated that his clinical observations over a number of years had never revealed any of the effects on the nervous system claimed by Schlophake, and in no instance, even on one occasion after exposure of a patient's hand to a wavelength of 6 meters for eight hours daily for five days, were any untoward reactions noted. It is surprising with exposure of only five minutes to a 25 meter wavelength that the rather amazing symptoms which are mentioned would be produced.

### SULFATHIAZOLE AND CUTANEOUS ERUPTION

*To the Editor*—A patient with malarial who was treated with received one month after treatment 2 Gm of sulfapyridine a dry fever of undetermined origin. Two weeks afterward the febrile symptoms recurred and he was given sulfathiazole, after which he had a rash. After a further four weeks he was given a large dose of sulfapyridine, as he had a perisplenic abscess and the surgeon considered an operation inadvisable because of the patient's condition. The rash has healed, but the patient had and has still, three months later, a painful rash. When exposed to sunlight the rash becomes more pronounced, but it is less noticeable on rainy days. It does not itch but is painful to touch and is worst on the legs, arms and neck. I should be glad to know whether this rash can be expected to disappear by itself or whether there is a possible cure for it.

L. Provo Kluit, M.D., New York

**ANSWER**—The first eruption noted was apparently due to sulfathiazole. The second eruption, which has persisted, suggests erythema nodosum, as the lesions are tender and situated on the legs, arms and neck. This most probably is not due to any of the sulfonamide drugs, as the type of eruption caused by them is usually of short duration. The splenic abscess mentioned might well have acted as a focus of infection and caused the eruption. If erythema nodosum is the correct diagnosis, the prognosis is good, as the disease disappears spontaneously.

### PERSISTING NONDIPHTHERITIC VAGINITIS IN CHILD

*To the Editor*—A girl aged 9 years has vaginitis of two years' duration. The cervix is normal. Repeated smears show diphtheria organisms which are inactive on inoculation. Schick tests have given negative results. Would there be any reason for giving diphtheria toxin in a therapeutic dose at this time, or would you suggest a treatment relating to diphtheria antitoxin? The discharge is profuse and the labia become excoriated from it. I believe that the treatments accepted in general practice have been used on the child in the past two years. I shall appreciate your interest in the case.

M.D., New York

**ANSWER**—Diphtheroid organisms are frequently a part of the normal vaginal flora. Since they do not produce diphtheria toxin, as the inquirer has demonstrated by animal inoculation, results are not expected from the use of diphtheria antitoxin. Persisting nongonorrheal vaginitis is frequently associated with persisting infection elsewhere, especially in the throat. In that case, relief of the original infection may relieve the vaginal symptoms. Another common cause of irritation, this may arise from tightness of the vulva, or obesity with heavy vulval pads, masturbation or the presence of a foreign body in the vagina and, probably, most of the cases require much local treatment.

## THE STOMACH AND MILITARY SERVICE

CHAIRMAN'S ADDRESS

WALTER LINCOLN PALMER, M.D., PH.D.  
CHICAGO

My purpose in this paper is to discuss briefly certain military aspects of gastric disease. Attention will be centered on the two most frequent conditions, peptic ulcer and chronic gastritis. The discussion will be based on civilian experience, on the records of the last war and on the reports from British and Canadian sources since the outbreak of the present conflict.

In the first world war gastric disorders were according to Hurst,<sup>1</sup> rather "rare among soldiers." Schindler<sup>2</sup> however, states that they were not rare in the German army, and Dick<sup>3</sup> recalls that in Base Hospital 11 of the American Expeditionary Forces in France digestive disorders were common. On the basis of civilian experience, indeed, one would not expect them to be rare. Autopsy studies indicate that peptic ulcer occurs at some time in at least 12 per cent of all adults. Furthermore the lesion appears about three times as frequently in males as in females, and the highest incidence occurs in the third decade of life, the period of greatest military service. The clinical recognition of gastric disease in 1914-1918 was in a rather elementary state, the direct objective methods of x-ray examination and gastroscopy were in the process of development. Haudel<sup>4</sup> had described the niche of gastric ulcer, and Cole<sup>5</sup> had clearly established the significance of the deformity and the crater of duodenal ulcer, the classic book by Carman and Miller<sup>6</sup> on "The Roentgen Diagnosis of Diseases of the Alimentary Canal" appeared in 1917, the method, nevertheless, was not widely used, and as far as the American army was concerned it was nonexistent (Case<sup>7</sup>). In the past two and a half decades, however, an amazing transformation has occurred. Gastrointestinal x-ray examination particu-

larly the mucosal relief technic under the influence of Akerlund<sup>8</sup> and Berg,<sup>9</sup> has been perfected to such a degree that now even very small ulcer craters may be demonstrated with an amazingly high degree of accuracy and with a frequency undreamed of in the years of the first world war. Modern gastroscopy has been developed and perfected during this period by Schindler,<sup>10</sup> using first the rigid gastroscope and later, in 1932, devising the flexible instrument now in use. And so today the diagnosis of gastroduodenal disease can be made by rather precise objective methods, whereas at the time of the first world war it was necessary to rely on clinical deduction.

In the present conflict "dyspepsia," according to Hurst<sup>1</sup> is "the largest single type of disease in the British army and from several points of view the most important medical problem of this war." In some of the early convoys from France the proportion of digestive cases was as much as 40 per cent and the total up to the emergency evacuation of base hospitals in April 1940 was 14.4 per cent. Out of 2,500 cases in various military hospitals in England in the second half of 1940 no less than 17.3 per cent were admitted for dyspepsia. The British have had a similar experience in the navy<sup>11</sup> and in the Royal Air Force. The Canadians have encountered the same problem in their expeditionary forces and in those at home.<sup>12</sup> Urquhart, Singleton and Feasby<sup>13</sup> found that while patients with symptoms relating to the upper part of the digestive tract constituted only about 4 per cent of some 25,000 indoor and outdoor patients seen for all causes in the fifteenth Canadian General Hospital in England from July 1, 1940 to June 30, 1941 the patients with digestive disorders nevertheless accounted for one third of the strictly medical outdoor patients and one fifth of those in the hospital medical beds in this period. In the United States Chamberlin<sup>14</sup> reports that the 316 patients in the gastrointestinal service of the Lawson General Hospital constituted 9 per cent of the total admissions between Aug. 1, 1941 and May 1, 1942 and 18 per cent of the medical patients.

In 1940 Payne and Newman,<sup>15</sup> working under the auspices of the Royal College of Physicians and the Leverholme Trust, made a very careful personal study of 287 patients disabled in the British army because of dyspepsia, covering the months of February, March and April, prior to the fall of France and the evacuation at Dunkirk. The results are shown in table 1. The majority of the patients seen were noncommissioned officers and men, but there was a small group of officers. Gross organic disease was present in 89 per cent of the cases studied, peptic ulcer was found in 96 per cent of these. Gastrosopic examinations were not made in the 28 cases (10 per cent) with diagnoses of "gastritis and duodenitis," "indefinite dyspepsia," "gastroenteritis" and "neurotic and functional" dyspepsia and hence the diagnosis may properly be questioned. Of 839 soldiers returned to Canada for medical reasons, 21 per cent were invalided because of peptic ulcer.<sup>13</sup> Chamberlin<sup>14</sup> reports that patients with peptic ulcer constituted approximately one third of the patients in the gastro-

intestinal disorders caused more rejections than any other disability except defective vision. It is rather surprising, therefore, to find that Saslaw and Junkermann,<sup>18</sup> in a recent study of the medical aspects of the Selective Service System in this country, do not mention digestive disorders (except insufficient teeth, gingivitis and hemorrhoids<sup>1</sup>) as a cause of rejection of 1,752 white men and Negroes during April, May and June 1941. Perhaps the draft and induction boards do not pay sufficient attention to dyspepsia. There is also some evidence that considerable variations exist in the practices of the different draft and induction boards. As far as peptic ulcer is concerned the surgeons, generals of the Army and Navy of the United States have wisely ruled that men known to have had an active ulcer within the past five years are not acceptable for service. However, such men are nevertheless admitted at times and for various reasons. The candidate or selectee may conceal the fact that he has an ulcer or he may not know it. Distress may have been altogether ignored or diagnosed as something else. If one wants to avoid all those errors, it would probably be necessary to carry out routine x-ray and gastroscopic examination before induction, but this is impossible, even if desirable. Men are inducted into military service at a rate of 150,000 or more a month. There are only 1,646 roentgenologists in the United States and Canada accredited by the Board of Radiology, and there are even fewer gastroscopists. Some of these men are in service, others carrying heavy civilian responsibilities. Consequently, in cases of dyspepsia the induction boards usually rely on clinical inquiry supplemented by more detailed examinations in questionable cases.

The man in service who develops dyspepsia, either for the first time or as a recurrence of an old distress, should of course be given adequate investigation and treatment. This has been partially assured through the efforts of Col. John Kantor to obtain the establishment of a section of gastroenterology in each hospital of one thousand beds or over. Presumably adequate facilities have been or will be provided. It is not possible to lay down arbitrary rules for the treatment of digestive disorders in general or of peptic ulcer in particular in military service. Gastroenterologists have never been able to agree on the best treatment of ulcers. Some are convinced of the advantages of the antacid regimens, others advocate diet alone, and the surgeons have their own varying concepts. The medical personnel of the armed forces vary in their attitudes toward peptic ulcer just as civilians vary. Consequently the surgeons are wisely following a liberal program based on individualization in treatment. It is recognized that under proper conditions, patients with peptic ulcer are capable of performing many important tasks. Here they may be assigned to limited duty within the continental United States under conditions permitting them to carry on such dietary and other therapy as may be necessary. It should be possible in this way to keep in limited military service many men with peptic

GASTRITIS

The subject of gastritis must be discussed in detail, I think, for just as there is a difference of opinion with regard to the proper treatment of peptic

18 Saslaw, Milton S., and Junkermann, Carl S. Medical Aspects of the Selective Service System. II. Follow Up Study. Vol. 1, 1941, p. 99 (Jan) 1942.

there is also a divergence of opinion with regard to gastritis its definition, origin symptomatology, diagnosis and treatment. By definition, gastritis means inflammation of the stomach. The word inflammation may be defined in different ways with varying connotations. Perhaps it will suffice to define it as local reaction to injury with or without demonstrable structural change. Usually in mucosal surfaces the reaction to injury takes place promptly and is evident objectively by hyperemia edema and exudation. Indeed pathologically one is reluctant to make a diagnosis of inflammation unless such changes are present. The diagnosis of gastritis is frequently made purely on the basis of symptoms presumed to be of gastric origin and presumed to be due to gastric inflammation. Thus the term acute gastritis is applied to any sudden and temporary digestive disturbance resulting from a variety of causes dietary indiscretions alcoholic debauches, food poisonings infections, emotional upsets. The presence of gastric inflammation is assumed. I doubt if one is justified in accepting as proved the close correlation thus implied between symptoms and gastric inflammation, although Beaumont<sup>19</sup> did describe transitory inflammatory changes in the mucosa under such circumstances. Nausea, vomiting and other so-called gastric symptoms may result from entirely extragastric causes.

The term chronic gastritis is likewise frequently used to refer either to digestive symptoms or to pathologic conditions of the stomach although the relationship between the symptoms and the mucosal changes has not yet been definitely established. The problems in this relationship may be illustrated by the so-called alcoholic gastritis. Numerous investigators notably Hirsch,<sup>20</sup> have failed to find consistent evidence of inflammation histologically in the stomachs of patients with chronic alcoholism. Schindler and Gray<sup>21</sup> in a gastroscopic study found chronic gastritis in only 45 per cent of 100 patients with chronic alcoholism. Morning nausea, with or without vomiting, was present in 80 per cent of the entire group. There seemed to be no relationship between the presence or severity of the morning sickness and the presence or absence of gastritis. Eighteen of the patients described an indefinite epigastric or abdominal distress. The stomach was normal gastroscopically in only 4 of these, in the other 14 some type of chronic gastritis was found. Schindler and Gray emphasized, however, "that only 4 of the 55 patients with normal or essentially normal stomachs complained of mild abdominal or epigastric distress. In contrast, definite subjective complaints were noted in 24 of the 45 patients with chronic gastritis. Severe or moderately severe gastritis was accompanied by symptoms in 20 of the 33 patients in whom it was found." This finding suggests a relationship between the gastritis and the distress, but further study is needed, as will be indicated. However, it is clear that the clinical diagnosis of "alcoholic gastritis" is inaccurate to the extent at least that in 55 per cent of the cases there is no gastroscopic evidence of inflammation.

Chronic gastritis in the strict pathologic sense is very common, though just how common is probably not

known. Entirely satisfactory autopsy or clinical statistics are difficult to obtain for various reasons. My associate Dr. Eleanor Humphreys, in a study of 22 well preserved stomachs obtained at autopsy from patients under 50 years of age dying from miscellaneous causes, found the textbook picture of a normal stomach in only 3 or 4. In 7 or 8 the changes were minor and probably insignificant, in 11 cases there was clearcut definite inflammation with or without atrophy in the body of the stomach. Gastroscopically also the incidence of chronic gastritis is high, being present in approximately half of the patients examined with the gastroscope because of digestive symptoms. Thus in one thousand such examinations made by Schindler in the United States the incidence of chronic gastritis was 41.8 per cent, in 255 examinations in Germany the incidence was 45 per cent. The correlation between the gastroscopic and the histologic changes has been studied by Swalm, Jackson and Morrison<sup>22</sup> and by Schindler and Ortmaier<sup>23</sup>. Many patients with gastritis have other organic disease such as peptic ulcer. Letendre and Schindler<sup>24</sup> in 171 cases of duodenal ulcer, found 99 cases (52 per cent) of chronic gastritis of various types. Schindler and Baumeier<sup>25</sup> in 91 cases of gastric ulcer found gastritis present at the initial examination in 38 cases (42 per cent). In pernicious anemia atrophic mucosal changes are the rule. In so-called simple achlorhydria, atrophic gastritis is a frequent finding. I have no doubt that in time a vast array of statistics will be assembled concerning the incidence of gastritis in various disease states. A study of the incidence of gastritis in presumably normal persons is also desirable. Present knowledge is not adequate. Such an investigation will be difficult to obtain because normal healthy persons are reluctant to undergo investigative procedures such as gastroscopy. The question of definition would also arise, i. e. should a person be considered healthy if gastritis is demonstrated gastroscopically?

Recognizing the great frequency of chronic gastritis pathologically, the question now arises as to its symptomatology and its clinical significance. Wolff and Wolf<sup>26</sup> have found experimentally that "sensitivity to pain in the stomach varies with the condition of the tissues. When the mucosa is acutely inflamed and edematous, pinching, faradic stimulation and moderately vigorous contractions result in pain. These stimuli do not cause pain when the gastric mucosa is in its normal state nor do they when only minor grades of gastritis are present, such as superficial erosions hemorrhagic and pigment spots." As in peptic ulcer, inflammation thus appears to lower the threshold for pain. The question therefore seems to be how much inflammation is required to produce a lowering of the threshold adequate for the production of pain. The answer must be found in clinical study. Schindler, Ortmaier and Renshaw<sup>27</sup> and other workers have struggled unsuccessfully to

differentiate the symptoms of the three primary types of chronic nonspecific gastritis, according to Schindler's classification, i. e. the superficial, atrophic and hypertrophic. My own experience has led me to the conclusion that these simple forms of gastritis do not produce symptoms. It must be remembered that abdominal distress is usually the indication for the gastroscopic exami-

TABLE 2—*Chronic Superficial and Hypertrophic Gastritis Without Disability*

|                | Gastroscopic Diagnosis   |
|----------------|--|
| Nov 12, 1934   | Chronic hypertrophic gastritis   |
| Sept 23, 1936  | Chronic hypertrophic gastritis of almost the entire stomach  |
| Oct 27, 1937   | Hypertrophic erosive gastritis of the distal portions of the stomach (improved) combined with superficial gastritis  |
| June 22, 1938  | Severe superficial gastritis (masking hypertrophic gastritis?)   |
| Oct 17, 1938   | Ulcer at lesser curvature above the angulus  |
| Nov 19, 1938   | Gastric ulcer at angulus   |
| Dec 19, 1938   | Severe ulcerative hypertrophic gastritis   |
| Jan 19, 1939   | Chronic superficial gastritis throughout stomach several erosions in angulus   |
| March 17, 1939 | Chronic hypertrophic ulcerative gastritis  |
| June 19, 1939  | Hypertrophic ulcerative gastritis of body of stomach (improved)  |
| Aug 21, 1939   | Hypertrophic gastritis of antrum, development of new, very small ulceration in the mucosa of angulus small area of hypertrophic gastritis  |
| Oct 2, 1939    | Chronic hypertrophic ulcerative hemorrhagic gastritis of lower portions of stomach with overlapping superficial gastritis  |
| Dec 4, 1939    | Severe superficial gastritis superimposed on hypertrophic gastritis  |
| Feb 7, 1940    | Extensive superficial chronic gastritis  |
| April 4, 1940  | Severe superficial gastritis of lower portions of the body   |
| July 8, 1940   | Hemorrhagic ulcerative hypertrophic gastritis of antrum and angulus  |
| July 22, 1940  | Former ulcerative hypertrophic gastritis now practically healed  |
| Sept 11, 1940  | Localized ulcerative hypertrophic gastritis of the angulus   |
| Nov 13, 1940   | Severe superficial gastritis with associated edema and reddening of antrum and body of stomach beginning atrophic gastritis of uppermost portions of stomach with blood vessel visualization |
| Feb 17, 1941   | Erosive gastritis of body and antrum of stomach  |
| June 23, 1941  | Benign gastric ulcer above angulus no definite gastritis   |
| July 14, 1941  | Definite benign ulcer above angulus, healing mild superficial gastritis of fornix  |
| Sept 3, 1941   | Chronic hypertrophic gastritis of lower portion of stomach, no certain ulcer visible, mild superficial gastritis of upper greater curvature  |
| Sept 15, 1941  | Ulcerative hypertrophic gastritis of angulus, extensive superficial gastritis of upper portions of stomach, no chronic ulcer   |
| Nov 10, 1941   | Unusually severe ulcerative hypertrophic gastritis   |
| Dec 1, 1941    | Hypertrophic ulcerative gastritis of antrum and angulus, with development of two exceptionally deep ulcers above the angulus   |
| Jan 1, 1942    | Hypertrophic ulcerative gastritis much improved, overlapping superficial gastritis   |
| March 13, 1942 | Ulcerative hypertrophic gastritis of lower one third of the stomach  |

nation and hence that the demonstration of gastritis does not prove it to be the cause of the distress. It has not seemed to me possible to differentiate the symptoms of the patients with gastritis from those without gastritis. Furthermore, I have not observed any relationship between the severity of the symptoms and the severity of the changes in the mucosa. The abdominal distress is usually that ascribed to the so-called irritable colon, a functional disturbance. One may question the validity of this diagnosis—and at the moment I hold

no brief for it—but the fact remains that, as a rule, in persons with this condition the distress may be relieved by the use of the traditional bland diet and antispasmodic drugs, even though the gastroscopic evidence of gastritis persists. Furthermore, while gastritis is present in nearly half of the cases of peptic ulcer, there is no relationship between the distress and the presence or absence of gastritis. If the ulcer is treated adequately there are no digestive symptoms even though a gastritis persists. Likewise in patients with pernicious anemia and a definitely abnormal gastric mucosa with atrophy and inflammation the digestive symptoms may be entirely absent or, if present, disappear quite regularly after the use of liver extract. To be sure, the gastroscopic appearance of the mucosa improves, but usually it does not become normal. It never regains its normal function, as is indicated by the failure of acid secretion to return, nor does it return to normal histologically, although the digestive symptoms usually disappear.

There is another aspect of the subject of symptomatology which should be mentioned, namely the positive and negative value of suggestion. Under almost all circumstances the power of suggestion is great, when backed by medical prestige and a new method of examination it becomes enormous. By way of illustration, the sacred aura surrounding the x-ray examination and the electrocardiogram may be mentioned. Many patients have been helped along the road to invalidism by inordinate concern over minor electrocardiographic changes. In both civilian and military life there are always certain persons glad to take advantage of minor physical defects, to use them as the basis for claims for disability insurance, as valid excuses for not working and for claiming exemption from military service. In such persons and in the more or less psychoneurotic person the capacity of suggestion to produce or prolong illness is very great.

A brief summary of 2 cases carefully observed for some time will perhaps serve as illustrations of the lack of relationship between gastritis and symptoms.

A man aged 42 came to the clinic on Oct 13, 1941 because of a "sensation of pressure under the left costal margin" of four years' duration. The history was otherwise negative. The physical examination, the laboratory studies and the roentgenologic investigation of the chest, gallbladder, esophagus, stomach, duodenum, terminal ileum and colon. Complicated achlorhydria (histamine) was demonstrated on two occasions. Gastroscopy by Dr. Schindler was reported as follows:

Oct 20, 1941, extensive atrophic ulcerative gastritis of the body of the stomach.

November 21, atrophic hemorrhagic gastritis of the body, with mild superficial changes of the posterior wall.

Jan 14, 1942, extensive atrophic gastritis plus severe superimposed superficial gastritis.

April 15, acute gastritis.

Treatment consisted of reassurance and the administration of  $\frac{1}{2}$  grain (0.03 Gm) of phenobarbital four times daily. There was no dietary restriction. The symptoms disappeared rapidly even though the gastritis persisted. The patient obtained position as a supervisory mechanical engineer in a tank plant, worked at least forty hours a week and, in emergency, as much as sixty hours weekly. The administration of phenobarbital has been discontinued, the patient remains clear and well, the gastritis persists.

28 Brown, Madeline R. The Pathology of the Gastric Mucosa in Pernicious Anemia and Subacute Combined Degeneration of the Cord, New England J. Med. 210: 473 (March 1) 1934.  
and Ungley, C. C. The Gastric Lesion in Pernicious Anemia. 1: 420 (Feb 19) 1938.

The second patient, a man aged 40, when first seen in October 1932 complained of abdominal distress of eighteen years' duration, dating from an injury in which "the ligaments were torn." The pain was said to have been cramplike and burning, chiefly epigastric, appearing two to three hours after meals and relieved by soda. The maximum gastric free acidity (histamine) was 70. Ten roentgenologic examinations of the stomach and duodenum were essentially normal in 1932, 1934, 1937, 1938, 1940 and 1941. Nevertheless in November 1932 the patient was hospitalized for two weeks of treatment (Sippy) for peptic ulcer. The distress disappeared. He continued the treatment in a very modified form and has remained well except for occasional distress relieved by a powder and closely correlated with 'nervousness, irritations of business, loss of temper, etc.' The results of the twenty-eight gastroscopic examinations, most of them carried out by Dr. Schindler, are shown in table 2. Throughout this period the patient has continued his work of supervising engineer in a utilities company and for the past five years has spent his spare time in manual labor remodeling his home. For the last five or six years he has recognized no dietary restrictions and has taken no medication except for an antacid powder on retiring, which he continues from force of habit. Occasional discomforts he has related to overwork and nervous strain. On Nov. 10, 1941 when Dr. Schindler found an unusually severe ulcerative hypertrophic gastritis, the patient stated that he had had no symptoms. When asked recently if his health had been sufficiently good to permit him to serve in the army if this had been desired, he replied enthusiastically that he knew he could have done so if he had been permitted to take his one powder a day and that probably he would not have needed even the one powder.

I have been speaking thus far in terms of the simple or uncomplicated superficial, atrophic and hypertrophic types of gastritis according to the classification of Schindler. It will be noted however, that in the case just cited the adjective "ulcerative" was frequently used in describing the inflammatory process in the mucosa. This patient did not have distress but I think it must be admitted that there are cases of ulcerative gastritis with ulcer-like pain or massive hemorrhage or both. This type of erosive or ulcerative gastritis seems to me related in certain instances at least to peptic ulcer. The gastritis appears to be not the cause of the ulcer but produced by the same mechanism, i. e. by the digestive action of acid gastric juice. Dragstedt<sup>29</sup> has reported the experimental production of such lesions. Clinically the same process is seen in the lower part of the esophagus, the so-called peptic esophagitis described by Winkelstein,<sup>30</sup> in the first portion of the duodenum and after gastroenterostomy, in the jejunum. It is found in its clearest form clinically, perhaps, in the gastrojejunitis noted in patients who have undergone a posterior gastroenterostomy or, more especially, a subtotal gastrectomy for peptic ulcer. These small anastomotic erosions or ulcers may heal or they may gradually increase in size until a frank jejunal ulcer is present. Patients with such lesions should be included, I think, in the group with peptic ulcer and not in the group with simple nonspecific superficial hypertrophic or atrophic gastritis.

If one concedes that ulcerative gastritis may produce epigastric distress, the question at once arises: Why not the nonulcerative types also? The answer would seem to be that in these forms the inflammation is not sufficient to bring about the requisite lowering of the gastric pain threshold.

#### ACTUAL DISABILITY

In passing from the subject of symptomatology to that of actual disability from chronic gastritis in the military forces I refer again to the study of Payne and Newman. The diagnosis in 7 of their 287 cases was "gastritis and duodenitis" and in 6 "gastroenteritis," although the criteria for these diagnoses were not stated. In addition there were 4 cases of "indefinite dyspepsia" and 11 of "neurotic and functional" dyspepsia. If the condition in all these 28 cases was in truth "chronic gastritis," the incidence of disability from this cause could be estimated as approximately 10 per cent. However gastroscopic examinations were not made apparently, and hence one is not justified in attributing the disability to gastritis even in this 10 per cent. Moreover, it seems to me highly probable that many of these were the result of nongastric causes. Hartfall's<sup>31</sup> statement is of interest in this connection: "I have reason to doubt the view that cases of persistent dyspepsia probably have severe gastritis." Gastroscopy [in] 58 otherwise negative dyspeptics with persistent symptoms has shown that in two thirds the mucosa was normal in one fifth trivial to moderate superficial mucosal changes were present. Only in about one seventh were serious organic mucosal changes found, including acute ulcer missed by x-ray, chronic patchy gastritis, anastomotic gastritis and atrophic gastritis." The incidence of actual disability for military service from the simple forms of chronic nonspecific gastritis seems therefore to be very low. Indeed, for the present it seems to me best to proceed on the basis that chronic nonulcerative nonspecific gastritis is not disabling whereas certain types of ulcerative gastritis may be related to peptic ulcer and may produce disability.

#### SUMMARY

Digestive disorders constitute a major problem in military medicine. The incidence of peptic ulcer in such disorders is very high. Consequently the policy of rejecting selectees who are known to have had an active ulcer within the past five years is wise and should be followed quite rigidly. In questionable cases a detailed investigation should be made and the candidate accepted only if it proves negative. When ulcers develop in service or recur, appropriate treatment should of course be given. When the lesion is healed the patient may be discharged or may continue on limited duty within the continental United States. He should not be allowed to return to full rations or active field duty.

The relation of gastritis to military service needs clarification. The clinical diagnosis of acute or chronic gastritis is vague, indefinite and unsatisfactory. Great care must be exercised in correlating symptoms with the mucosal changes seen gastroscopically. In my judgment the evidence available at present indicates that the so-called simple nonspecific, superficial, atrophic and hypertrophic forms of chronic gastritis do not produce symptoms and hence do not constitute a cause of disability. Ulcerative gastritis, however, may be associated with an ulcer-like distress or with massive hemorrhage or both and seems at times, at least, to be related to the lesion peptic ulcer. Patients with this condition for practical military purposes should be included in the group of patients with ulcer and treated accordingly.

## DIABETIC COMA

ELLIOTT P. JOSLIN, M.D.

HOWARD F. ROOT, M.D.

ALEXANDER MARBLE, M.D.

BOSTON

Two considerations led to the preparation of this report regarding our recent experience in the treatment of diabetic coma.

1 A growing realization that diabetic coma is an acute deficiency state, a condition in which the primary disturbance is a lack of insulin. In treatment, this fact should be the feature kept most prominently in mind by the physician. Everything else is secondary to the energetic supplying of really adequate amounts of insulin, regardless of how many units this may mean. We regard as regrettable the tendency of some clinicians in their talks and writings to wander away from this fundamental idea for the successful treatment of diabetic acidosis. Without large amounts of insulin given early, maximal success can never be obtained despite the carrying out of other secondary measures, chiefly the supplying of fluid and electrolytes abundantly, however physiologically sound they may be in their own right.

2 The fact that, in this clinic from Aug. 21, 1940 until July 15, 1942, 62 consecutive patients with diabetic coma were treated without a single death. It is believed that restatement of the methods employed is worth while, since our experience contrasts sharply with the high mortality still found in certain other clinics (23.6 per cent among 220 cases recently reported<sup>1</sup>).

## CLINICAL MATERIAL

*Patients*—From May 1923 to January 1942 there were treated in this clinic 525 patients with diabetic acidosis the carbon dioxide content<sup>2</sup> of whose blood plasma was on admission to the hospital or at any time during hospital stay 20 volumes per cent or less. The justification for this arbitrary selection of cases of diabetic coma has been discussed amply before. Careful consideration has led us to retain this method of classification. Intimate knowledge of the patients and critical survey of the data convince us that the cases included in the series are comparable in type and severity of acidosis to those regarded by physicians in general as cases of diabetic coma.

In table 1 are listed the outstanding features of the different groups of patients seen since May 1923. Of the 525 patients, 188 were males and 337 females. The average age at the time of coma was 30.5 years, and the average duration of diabetes prior to coma was 4.4 years. The average blood sugar value on admission to the hospital in coma was surprisingly constant from series to series, being 0.49 per cent for the whole group. The average initial carbon dioxide content of the plasma

for the entire group was 12 volumes per cent, this had risen on the second hospital day to 30 and on the third hospital day to 42 volumes per cent. The average initial blood nonprotein nitrogen value was moderately elevated, being 45 mg. per hundred cubic centimeter. The amount of sugar in the urine although large was not extraordinarily so, averaging for the group 3.2 Gm. per hundred cubic centimeters. The average amount of insulin used during the first twenty-four hours was 208 units for the entire series and 218 units for cases observed since February 1929. The mortality for the entire group of 525 cases was 11 per cent, there being 58 deaths. In the last series from January 1940 to January 1942, among 62 cases there were only 3 deaths a mortality of 4.8 per cent.<sup>2a</sup>

There was not a single death among the 62 patients, average age 29.4, seen from Aug. 21, 1940 to July 15, 1942.

*Precipitating Factors*—In our experience the commonest cause of diabetic coma continues to be laxity in treatment, consisting either of dietary indiscretion or neglect to take an adequate amount of insulin or both. These factors appeared to be responsible for the precipitation of coma in 33, or 53 per cent, of the 62 cases in the series from January 1940 to January 1942. There were an additional 6, or 10 per cent of the total, in which the onset of diabetic coma was the first recognized sign of diabetes. The second commonest precipitating factor was infection, having apparently been responsible for coma in 14, or 23 per cent of the 62 cases. In 2 cases the onset of coma came at the time of menstruation.

*Age*—The average age of the 525 patients in the total series was 30.5 years and of the 62 patients seen in the latest series 27.6 years. One hundred and thirty-nine of the 525 patients were 15 years old or under at the time of onset of coma. 84 patients were 50 years or more at that time. The youngest patient included in the total series of 525 was aged 11 months and the oldest patient was aged 77.5 years at the time of coma, both patients recovered.

*Duration of Diabetes Prior to Coma*—In the last three series of cases studied since October 1934, representing 42, 145 and 62 cases respectively, the average duration of diabetes prior to the onset of coma has been surprisingly constant, ranging from 5.2 to 5.6 years. In the latest group of 62 cases the average figure was 5.3 years, in 12 of the cases, however, the onset of coma was within one year of the time of onset of symptoms of diabetes.

*Mortality*—We naturally take pride in the fact that no death from coma has occurred in the 62 cases observed from Aug. 21, 1940 to July 15, 1942. We realize, of course, that this perfect record may depend in part on chance and may be spoiled at any time by the admission of a patient in a moribund or semicomatose condition beyond the possibility of recovery. However, our results during this twenty-two month period have given us new hope and added encouragement in our continuing effort to abolish death from diabetic coma.

It would be unwarranted to hope that no patient entering a hospital in diabetic coma will die.

From the George F. Baker Clinic, New England Deaconess Hospital. Over a period of years many associates have assisted in the treatment of the patients discussed in this report. More recently these have included Drs. Allen P. Joslin, C. Cabell Bailey, Charles W. Styron, Harold E. Eisele and Jane Byars.

<sup>1</sup> Beardwood, J. T., Jr., and Rouse, G. P., Jr. Diabetic Acidosis. A Study of Two Hundred and Twenty Consecutive Cases, J. A. M. A. 117: 1701 (Nov. 15) 1941.

<sup>2</sup> In cases observed prior to January 1939 the carbon dioxide combining power was determined.

<sup>2a</sup> To avoid confusion the reader's attention is called to the fact that by chance the number of cases seen between Jan. 27, 1941 and Jan. 15, 1942 (Series IX in Table 1) was 62, the same as the number seen between August 1940 and July 15, 1942.

will from time to time be those patients in whom a complicating disease is in itself fatal, and according to our custom such deaths would be listed as deaths from diabetic coma. However in the past a high percentage of these deaths have been in patients with acute overwhelming infections often pneumonia or septicemia, and at the present time and increasingly in the future one can justifiably hope that certain of these infections can be prevented or controlled by early and adequate sulfonamide therapy.

In comparing mortality statistics of one clinic with those of another it is essential that consideration be had for the type of patients included in the two series. For example as shown in table 2 the prognosis for

patients with blood sugar values over 1,500 mg per hundred cubic centimeters or with carbon dioxide values below 5 volumes per cent and patients with nonprotein nitrogen levels above 100 mg per hundred cubic centimeters all have recovered with prompt and energetic treatment. Except for a complicating disease of a nature so serious as to be fatal in itself, the single most important consideration is the depth and duration of unconsciousness prior to institution of treatment. This is apparent from a study of table 3. Among 514 cases for which data are available, the mortality among patients who were conscious on admission to the hospital was 4.5 per cent, as contrasted with 8.6 per cent for those who were drowsy or semicon-

TABLE 1—Summary of Five Hundred and Twenty-Five Cases of Diabetic Coma, Comparative Study, by Averages of the Nine Series

| Series and No of Cases | Age in Years | Duration of Diabetes Mellitus in Years | Date                 | Blood               |                     |                                 |                   |                  |                                    | Urine at Entrance | Sugar per Cent     | Insulin Units       |                    |                    | Fatal Cases |    |          |

\* Unmodified insulin. † Protamine zinc insulin. The subfigures indicate the number of determinations on which the average is computed in each series.

recovery among children is much better than among adult patients. Indeed from May 1923 until May 1942 among 139 children 15 years of age or under at the time of onset of diabetic coma we have seen only 1 death, a mortality of 0.7 per cent. Therefore, in the definitive testing of any given form of therapy, the experience with adult patients is much more valuable than that with children.

As has been emphasized repeatedly in the past, there is no single factor which can be correlated with death from diabetic coma, but usually a combination of various factors. The age of the patient, the depth of acidosis, the duration of unconsciousness and the level of the blood sugar, of the plasma carbon dioxide and of the blood nonprotein nitrogen all play important roles. However, patients over 70 years of age, patients profoundly unconscious, patients in extreme shock with no blood pressure reading obtainable on admission,

conscious and with 31.2 per cent for those who were unconscious when first seen.

Table 3 is of further interest in that a fair correlation is apparent between the mental condition and the plasma carbon dioxide content to mortality.

Of 211 patients with a carbon dioxide content of 10 volumes per cent or below, 15.6 per cent died, of 303 patients with a carbon dioxide value of 11 to 20 volumes per cent, only 7.9 per cent died. Of the 93 patients who were unconscious on admission to the hospital, 59 had a carbon dioxide value of 10 volumes per cent or below, and in these there was the highest mortality of any group in the entire series, 32.2 per cent of these dying. However, it must be emphasized that of the last 62 patients treated without a single death there were 12 who were totally unconscious and 34 who were semiconscious or drowsy. Total unconsciousness is by no means a barrier to recovery.

The 3 fatal cases included in the series of 62 instances of coma ended Dec 31, 1941 require explanation

CASE 1—A woman aged 40, with a history of schizophrenia of about twenty years' duration, appeared moribund when first

seen, April 3, 1940. The patient was not known to have diabetes, although from symptoms it seemed possible that the disease had existed from about January 1940. The diagnosis of diabetes and diabetic coma had been made by the patient's sister, who is the mother of one of our diabetic patients and the daughter of another. When the patient was first seen

a large carbuncle of the neck. The patient was given large doses of insulin, which brought about satisfactory recovery from the diabetic acidosis. On August 14 the carbuncle was incised and drained. A further incision and drainage was necessary on August 24. On August 25, the twelfth day in the hospital and long after his recovery from the acidosis, he became unconscious, developed a right hemiplegia and died within twenty-four hours. Postmortem examination disclosed a large pituitary tumor of the chromophobe type, which had grown out of the sella turcica and extended up into the brain.

CASE 3—A woman aged 32 with diabetes of five years' duration was admitted in profound acidosis on Aug 17, 1940. On admission the plasma carbon dioxide content was 4 volumes per cent and the blood sugar value was 550 mg per hundred cubic centimeters. During the first six hours in the hospital she was given 500 units of insulin together with 2,500 cc of isotonic solution of sodium chloride parenterally. Her general condition improved, and the blood sugar was brought to a satisfactory level and remained so throughout the rest of the stay. However, acidosis with attendant rapid, labored breathing persisted. Furthermore, the output of urine became steadily less and the blood nonprotein nitrogen content rose. Concentrated dextrose solution given intravenously did not stimulate diuresis. On August 19, when the blood sugar was 110 mg per hundred cubic centimeters and the plasma carbon dioxide content 10 volumes per cent, infusion of sixth molar sodium lactate solution intravenously was begun. During the

\* Eleven patients, including 1 who died, with incomplete data have been excluded.

the pulse could barely be obtained, the systolic blood pressure was only 40 mm of mercury and the body was cold and mottled. The patient was given 200 units of insulin at once and a total of 1,000 units within the first six hours. Other therapy during this period included 5,500 cc of isotonic solution of sodium chloride subcutaneously. The next day her condition seemed much improved, she was responsive, the pulse and blood pressure were satisfactory, the urinary output was normal and values for blood sugar and carbon dioxide gradually returned to within a satisfactory range. However, later on April 4 and to a greater extent on April 5 the patient again became drowsy, barely responsive, breathed noisily and had periods of apnea. Since the patient was known to have had a very limited diet for several months and to have eaten practically nothing for five days, it was thought possible that her condition might be due in part to multiple vitamin deficiency. Consequently large doses of thiamine hydrochloride and nicotinic acid were given parenterally. By April 8 her general condition seemed definitely improved. However, late in that day her condition again became worse and she died suddenly. Permission for a postmortem examination was refused, so that the exact immediate cause of death could not be determined.

CASE 2—A man aged 49, with onset of diabetes in July 1936, was admitted on Aug 13, 1940 with a blood sugar value of 380 mg per hundred cubic centimeters, a plasma carbon dioxide content of 19 volumes per cent and a blood nonprotein nitrogen value of 51 mg per hundred cubic centimeters. There was much diacetic acid in the urine and 4.6 Gm of sugar per hundred cubic centimeters. The most important feature was

course of the next twenty hours 3,600 cc was given. This produced gratifying subjective improvement with easier breathing. The plasma carbon dioxide content on the morning of August 20 was 41 volumes per cent. Coincident with the secretion of urine increased, and in the twenty-four hours preceding death the volume of urine was 2,800 cc and the blood nonprotein nitrogen content had fallen from 103 to 81 mg per hundred cubic centimeters. However, the patient succumbed, presumably to her third handicap, that of pneumonia, bronchial and lobar, which was present on admission in the right lung and later spread to the left lung. On admission the temperature ranged between 102 and 103 F but returned to normal coincident with treatment with sulfapyridine. The morning of August 24 it seemed likely that recovery would take place, but a short time after the morning meal her condition rapidly became worse and she died. Unfortunately, permission for postmortem examination could not be obtained.

The third patient is one of the few admitted in diabetic coma to receive at our hands intensive alkali therapy since 1917, although the alkali was given for the diabetic ketosis but for an acidosis, presumably to inorganic acids associated with uremia, and followed in its wake. Furthermore, three methods—insulin, sodium lactate and sulfapyridine, were used with specific results.

Thus, of the 3 fatal cases, in only 2 did death actually play a role in death, and in each case it seems likely that other conditions not actually

nosed, since there was no postmortem examination, may actually have been responsible for death

#### OUTLINE OF TREATMENT

1 *Preparatory Measures*—The treatment of diabetic coma properly belongs in a hospital. Every effort should be made to transfer the patient at once to a hospital since the emergency is just as great as when a patient requires immediate surgical therapy. The hospital should be one in which laboratory service can be given at any time day or night, including holidays and Sundays. All preparations for treatment should be based on the fact that diabetic coma is an acute medical emergency in which early prompt, vigorous treatment is absolutely essential if good results are to be secured. When it is learned that a patient is to enter the hospital everything should be put in readiness, a bed should be prepared with blankets and hot water bottles and apparatus should be assembled for the giving of fluids subcutaneously or intravenously for gastric lavage and for enemas. The medical, nursing and laboratory staff should be informed to stand by and to remain in constant attendance until the patient is out of danger. If over the telephone it seems that the diagnosis is absolutely certain, then a preliminary dose of 50 units of insulin may be ordered given at home or on the road to the hospital. Immediately on arrival at the hospital, intensive treatment begins.

On reception at the hospital the patient is put to bed, well covered with blankets and surrounded by hot water bottles placed outside the blankets so that there is no possibility of burning the skin. The history and physical examination are carried out at once as completely and yet as quickly as possible. Even before this is done, a urine specimen is obtained and venous blood is withdrawn for the determination of the blood sugar, plasma carbon dioxide, nonprotein nitrogen and chloride content. The blood and urine specimens are given at once to the laboratory technician so that the analyses can be started without delay and reported as soon as made. If the patient is unable to void, urine may be obtained by catheter, although catheterization is to be avoided if possible because of the danger of urinary tract infection.

2 *Insulin*—Insulin must be accorded first place in any discussion of the treatment of diabetic coma. Other measures, such as the providing of warmth, adequate fluids and salt intake, and stimulants, all have their place, but no physician will achieve a good record in the treatment of diabetic coma unless he always keeps in mind that a truly adequate amount of insulin given early is the most important measure. We commend enthusiastically the way in which Olmsted<sup>3</sup> begins the summary of a recent article. "The principles of treatment of diabetic acidosis as recommended in this [Olmsted's] clinic are: 1. The fearless use of large doses of insulin."

The first dose of insulin varies from 20 to 100 units of the regular or crystalline variety given subcutaneously. The dose for the average patient is 50 units. Particularly if the patient is unconscious and in shock, an accompanying dose of the same size may be given intravenously. In an average case a second dose of like amount is given one-half hour later. By this time at least some of the laboratory reports will be available, and in the usual case at least two other doses of insulin

of 50 units will be necessary at half hourly intervals. The average patient requires about 200 units of insulin within the first two to three hours of treatment. At the end of this time another sample of blood should be taken for determination of the sugar and carbon dioxide content, these values will serve to guide one as to whether treatment should be pushed more or less energetically. If despite the large initial dose of insulin the blood values have shown little or no tendency to return toward normal, even larger doses of insulin should be given more frequently. Thus at times it may be necessary to give as much as 100 or more units of insulin at half hourly or hourly intervals. If, however, satisfactory return of the blood values toward normal has begun, less energetic measures may be employed. Often the patient at this time will be able to void at hourly intervals, and if so the administration of insulin subsequently may be gaged by the outcome of qualitative Benedict tests done hourly, insulin being given according to a schedule somewhat as shown in table 4. As the patient's condition improves, the interval of collection of specimens and the giving of insulin may be increased to every two and later to every three or four hours.

Throughout all this time the clinical condition of the patient, including particularly the mental state and the type of breathing, will serve as valuable guides to the administration of insulin. However, even experi-

TABLE 4—Schedule for Administration of Insulin

| Benedict reaction        | Red | Orange | Yellow | Yellow-Green | Green or Blue |
|--------------------------|-----|--------|--------|--------------|---------------|
| Insulin (units) required | 24  | 20     | 16     | 12           | 0             |

enced observers will be misled at times if reliance is placed solely on clinical findings and impressions. Consequently, one should feel no hesitancy in securing as frequent laboratory determinations as necessary to gage the progress of treatment.

3 *Fluids and Salt*—The administration of fluids and salt may be discussed together, since their administration is usually combined. Prominent among the abnormalities present in diabetic coma are dehydration, hemoconcentration and reduced peripheral blood flow.<sup>4</sup> The dehydration brought about by vomiting and the severe diuresis incident to glycosuria and acidosis is evident in the dryness of the skin and mucous membranes and the softness of the eyeballs. Not only has fluid been lost from the body but also there is loss of electrolytes, sodium, potassium and chloride. Fortunately, the latter deficit can be made up satisfactorily by the supplying of simple sodium chloride. Consequently the early, continuous and adequate giving of isotonic solution of sodium chloride intravenously, subcutaneously or both is second in importance only to the giving of adequate amounts of insulin. The administration of 1,000 to 1,500 cc should be begun within the first few minutes after admission to the hospital, and, depending on the degree of dehydration and general condition of the patient, this may be repeated one or more times within the first six hours of treatment. As time goes on and the patient becomes able to tolerate fluids by mouth, increasingly large amounts may be given in

uted to the vitamin occurs relatively seldom and usually is rather slight. Symptomatic improvement occurred more often than objective improvement, but a few patients definitely showed significant subjective and objective improvement. Reduction in the erythrocyte sedimentation rate occurred only rarely. Often improvement lasted only a short while after treatment was stopped, Slocumb<sup>16</sup> also emphasized this temporary effect. The most frequent unpleasant effects were anorexia, nausea and vomiting, sometimes severe. Occasionally dryness of the mouth, increased thirst and polyuria were objectionable, in 1 case only 50,000 units daily caused these symptoms, soon followed by albuminuria, urinary casts and reduced renal function, for which no explanation but the effect of vitamin D appeared to exist. Hypercalcemia (above 12 mg per hundred cubic centimeters of serum) occurred in several cases. In 1 case serum calcium rose to 14 mg per hundred cubic centimeters while the daily dose of vitamin was 300,000 units, in another in which the dose was 200,000 units daily serum calcium rose to 16 mg per hundred cubic centimeters. A third patient,

in the treatment of psoriasis also.<sup>18</sup> Results in these cases are summarized separately in table 7. A higher percentage of this group showed improvement, but still the benefit was not very impressive. The lack of objective improvement, the infrequent reduction in the erythrocyte sedimentation rate, the occasional toxicity and the expense should be emphasized. Improvement, when it occurred with ertron therapy was much more often subjective than objective, and not infrequently patients would state that they felt better in general, "had more pep" and had less indigestion and constipation although improvement in rheumatic symptoms was not especially noted. We wished to determine how much of this improvement might be psychogenic to test this we preceded ertron treatment with the administration of capsules of lactose<sup>19</sup> which looked exactly like ertron. This placebo was given for one or two months in a manner just like ertron therapy and then ertron capsules were given, care being taken that the patient did not know of the change. Results of the test are presented in table 8. It was noticed that improvement seldom occurred during the administration

Average cost for medicine at standard price, \$120 per patient  
Toxicity required cessation of treatment in 6 patients (16 per cent)

\* Ertron "

† Albuminuria, cylindruria and impaired renal function also existed

receiving 400,000 units, had an elevation in serum calcium to 19 mg per hundred cubic centimeters, and a fourth, who could not tolerate 200,000 units because of vomiting, could take 50,000 units every other day but had a serum calcium concentration of 14 mg per hundred cubic centimeters. When these high serum calcium values obtained, gastrointestinal symptoms were usually severe. In 16 per cent of all cases summarized in table 5, vitamin D treatment had to be discontinued because of toxicity. The cost of the drug as we employed it, at standard retail prices,<sup>16a</sup> was not small, it averaged \$120 a patient!

Experience with ertron therapy in other than cases of rheumatoid arthritis was much smaller. Results of studies on 8 patients with either osteoarthritis or fibrositis appear in table 6. In general, the data are similar to those we obtained in cases of rheumatoid arthritis.

We were especially interested in the effect of vitamin D on patients with rheumatoid arthritis and psoriasis (some having so-called classic psoriasis arthropathica<sup>17</sup>), for vitamin D has been reported beneficial

of the placebo and when observed it was relatively slight. By this criterion, benefit observed during ertron therapy must only seldom be psychogenic.

TABLE 6—Results in Eight Patients with Osteoarthritis or Fibrositis Treated with Activated Ergosterol\*

| Average Daily Dose Vitamin D Units | Number of Patients | Improvement     |           | Toxic Effects     |          |               |

19 Prepared and furnished for this specific study by J. M. A. Georgia 30: 398-400 (Sept.) 1941.

Results of this entire study of vitamin D therapy are certainly far from impressive of great value in this form of treatment<sup>1</sup>. It is beneficial in only a minority of cases, although in some instances significant improvement occurred which could be explained only by the effect of vitamin D or a coincidental natural improvement. In the majority of cases improvement when it occurred was only symptomatic and temporary, seldom could the course of the disease be considered to be favorably altered.

In view of these facts vitamin D in massive doses should not be used with a comfortable feeling that great benefit is certain to result. Our data would not support the contention that great benefit does result although some persons seem to be improved at least subjectively and not on a psychogenic basis when receiving high dosage vitamin D therapy. Ertrion, claimed by some to be nontoxic does have real potentialities for producing undesirable effects especially gastrointestinal, and hypercalcemia certainly results occasionally. The expense of the drug is considerable<sup>1</sup>. This form of therapy should not be relied on as the only form of treatment (as is all too commonly the case) for seldom is the course of the disease favorably altered. It would seem wise to consider

## VITAMIN K

Rawls<sup>21</sup> states that hypoprothrombinemia was found in about 50 per cent of patients with rheumatoid arthritis and in some patients with gouty arthritis. Administration of vitamin K restored the prothrombin level to normal, no mention is made of the significance of these observations to the rheumatic diseases.

Many investigators have considered various endocrinopathies important causative factors of chronic arthritis especially osteoarthritis. On this basis treatment with different endocrine preparations has been advised.

## THYROID

Many investigators have studied the thyroid activity of patients with chronic arthritis. It has been reported that hyperthyroidism is peculiarly frequent in arthritic patients, others state that hypothyroidism is predominant. More recent workers are certain that the majority of patients with chronic arthritis have normal thyroid activity but that hyperthyroidism or hypothyroidism may occur in patients with arthritis, and when dysthyroidism exists it usually has no relationship to the arthritis but is coincidental. There are some who believe that many cases of osteoarthritis are due to hypothyroidism, however, Bauer<sup>22</sup> is convinced that

vitamin D only as an adjunct to a well rounded program of treatment the use of which might be helpful when other therapy, which might be more apt to arrest the arthritis was ineffectual or could not be employed.

## VITAMIN E

Patients with fibrositis have been treated with vitamin E (both natural and synthetic preparations). Stenberg and Ingham separately report that "all patients showed remarkable improvement"<sup>20</sup>. We have

TABLE 8—Results of Placebo Control of Vitamin D Effect in Twenty-Five Patients (Twenty-Eight Courses of Treatment)

| Improvement |   |           |
|-------------|---|-----------|
| Subjective  |   | Objective |
| Slight      | + |           |
| 2           | 6 | 0         |

started a study of the effects of treatment with this vitamin but it has not progressed sufficiently to make a final statement of our results. To date they are unimpressive.

subnormal basal metabolic rates occur no oftener among osteoarthritic patients than among any other group of patients of similar age and that there is no proof for the endocrine theory of osteoarthritis. Thyroid dysfunction and chronic arthritis are both common diseases, and it should not be surprising that they might coexist in some persons. It would seem wise, therefore that physicians should be alert to recognize dysthyroidism in patients with chronic arthritis and treat it when it occurs as they would in a nonarthritic patient. If hypothyroidism exists proper treatment with thyroid is indicated and when it has been controlled the patient may be significantly improved but improvement in the arthritis should not be expected directly as a result of treatment with this endocrine preparation.

## PARATHYROID

The theory that hyperparathyroidism is responsible for some cases of rheumatoid arthritis has led to parathyroidectomy as a measure of treatment. However, careful study has failed to support either the theory or the benefit of such treatment. I have seen arthritic patients whose parathyroids had been removed as a measure of treatment for the arthritis and the disease became worse. I have also seen rheumatoid arthritis

develop in a patient who had chronic hypoparathyroid tetany (post-thyroidectomy) for years. I am convinced that there is no direct relationship between parathyroid function and arthritis.

PITUITARY

Although there has been some study of possible pituitary effects on joints, treatment of arthritic patients

TABLE 9—Effect of Estrogenic Substance on Rheumatic Disease Occurring with Menopause

|            | Number of Patients | Drug Used                   | Results  |           |
|------------|--------------------|-----------------------------|----------|-----------|
|            |                    |                             | Improved | No Effect |
| Arthritis  | 9                  | Theelol<br>1 mg daily       | 4        | 5         |
|            | 3                  | Progynon B<br>2.7 mg weekly | 2        | 1         |
| Arthralgia | 6                  | Progynon B<br>1.6 mg weekly | 5        | 1         |

with pituitary preparations has been only rarely suggested. There is no justification for such treatment according to the present state of our knowledge.

ADRENAL GLAND

There is no evidence that the adrenal gland is in any way related to any type of chronic arthritis.

ESTROGENIC SUBSTANCE

Because of the fact that many women have arthritis for the first time or have an exacerbation of an already existing arthritis at the time of the menopause, and because still more have prominent rheumatic symptoms, especially arthralgia, at the time of the menopause, it is suggested that there is an intimate relationship between the gonadal hormones, and perhaps the whole endocrine system, and some forms of rheumatic disease. The term "menopause arthritis" has been used to refer to the joint disease occurring with the menopause, but no specific entity has ever been defined, sometimes joint changes typical of rheumatoid arthritis occur, other patients have quite characteristic osteoarthritis. Definite abnormalities of the joints certainly develop in many patients, so that the term "arthritis" is often

TABLE 10—Effect of Estrogenic Substance on Fibrositis Occurring with Hypomenorrhea

| Number of Cases | Drug Used                   | Results  |           |
|-----------------|-----------------------------|----------|-----------|
|                 |                             | Improved | No Effect |
| 3               | Theelol<br>0.6 gm daily     | 2        | 1         |
| 4               | Progynon B<br>1.6 mg weekly | 2        | 2         |

justified, however, most persons who have rheumatic symptoms during the menopause exhibit no definite articular changes, and in such cases the term "menopause arthralgia" serves to differentiate this from true arthritis.

One of the first endocrine preparations used to treat menopause arthritis and arthralgia was thyroid substance for sometimes thyroid deficiency definitely exists. In such cases benefit is derived from the thyroid.<sup>23</sup> However, with development of our knowledge regard-

ing the nature of the menopause, it became evident that use of estrogenic substance might more often be helpful. Numerous reports indicate that adequate treatment with a potent estrogen will often completely control the arthralgia and even arthritis which develop with the menopause both natural and artificial.<sup>24</sup> It is so often true that effective treatment for certain specific types of disease is used promiscuously that estrogenic substances have been employed in the treatment of many rheumatic conditions other than those coincidental with the menopause. We have been interested in learning what the limitations of usefulness of estrogen are and what advantages result from different routes of administration of the substance. We have therefore used the oral preparation "theelol"<sup>25</sup> and the substance "progynon B"<sup>26</sup> injected intramuscularly. Results in these cases are summarized in table 9. Theelol in the doses used caused improvement in 4 of our 9 patients with arthritis occurring with the menopause, and progynon B as used brought improvement in 2 of 3 cases. The number of cases studied is too small to make our figures statistically significant. It should be emphasized that many of our patients had arthritis (usually rheumatoid) before the menopause, arthritis developed in only a few during the menopause. In those patients who had

TABLE 11—Effect of Estrogenic Substance on Spondylitis Rhizomelica

| Number of Cases | Drug Used                                  | Results  |           |
|-----------------|--|----------|-----------|
|                 |  | Improved | No Effect |
| 5               | Theelol<br>1 mg daily                      | 0        | 5         |
| 3               | Diethylstilbestrol<br>4 mg daily (in case) | 0        | 3         |

showing signs of the menopause after arthritis, even improvement in the arthritis was slight or there was none, although typical symptoms of the menopause were effectively relieved by estrogen therapy. We could detect no particular difference in the effects of the oral and the injected substance provided sufficient doses were used. Significantly more of the substance was needed when given by mouth.

All the cases of arthralgia included in table 9 were so-called menopause arthralgia and it should be noted that good results were obtained in relieving the arthralgia as well as other menopausal symptoms of these patients. Sometimes quite large amounts of the substance were required, however—from 16 to 32 (10,000 to 20,000 rat units) every five or seven days—as emphasized also by Hall<sup>24</sup> and Dunn.<sup>27</sup>

In table 10 are the results of estrogen therapy in a few cases of "fibrositis" occurring with hypomenorrhea in young women. In some cases there was no improvement, but the degree of improvement was usually slight, always incomplete and usually temporary.

as used this form of therapy was not sufficient to control the rheumatic symptoms and was in most cases abandoned

Because spondylitis rhizomelica occurs predominantly in males and because estrogens have been shown to have a definite effect on pelvic ligaments,<sup>28</sup> it has been suggested that treatment with estrogens might be effective in this form of spondylitis. In 8 cases (7 males 1 female) in which we studied the effects of estrogenic substances orally with both natural and synthetic preparation we could observe no beneficial effect (table 11).

From our studies together with those of others it appears that in patients undergoing the menopause in whom rheumatic disease develops at that time adequate treatment with potent estrogenic substance may often have significant benefit on the rheumatism as well as on other menopausal difficulties. Oral preparations seem as effective as the injected substance when used in adequate amounts, by either route moderate to large doses may be needed to effect good results. Estrogen therapy had little or no effect on the rheumatic disease in our cases of existing arthritis when the menopause began in patients with fibrositis and hypomenorrhea and in persons with spondylitis rhizomelica.

#### SUMMARY

With the current tendency toward unbounded enthusiasm for various vitamin and endocrine treatments for chronic arthritis, it seems timely—yes even necessary—to emphasize the limitations in usefulness of these therapeutic agents. There is no known antirheumatic vitamin! It has not been clearly shown that any vitamin has any direct relationship to any rheumatic disease. It is true that deficiency of certain vitamins exists not infrequently in patients with chronic arthritis, in such cases adequate intake of the deficient food factor may materially improve the health of the patient, but it should not be expected that such treatment will directly benefit the arthritis. Vitamin therapy in this group of cases is a part of the treatment of the patient's general health and state of nutrition and not a "specific" treatment of the rheumatic disease. In some patients massive doses of vitamin D appear to have a beneficial effect, especially symptomatically, in most of our patients improvement from vitamin D could not be detected. There is little or no evidence that this vitamin favorably alters the course of the rheumatic disease especially rheumatoid arthritis. If used, therefore vitamin D preparations should not be relied on as the "one measure treatment" for arthritis. The potential toxicity and expense should be kept clearly in mind.

Neither is there known to be a hormone "specific" for arthritis, except in some cases of rheumatic disease developing with or shortly after the menopause, when estrogenic hormones, in adequate amounts orally or intramuscularly, are of distinct and apparently of direct benefit. In all other cases endocrine preparations should be helpful in the treatment of patients with rheumatic disease only when definite hypofunction of an internal secreting gland exists, and in such cases proper substitution therapy can be expected to be helpful only in correcting the deficiency state and the symptoms resulting therefrom and not directly to the rheumatic disease.

## REHABILITATION AND PREHABILITATION

LEONARD G ROWNTREE, MD

Colonel M R U S Army, Chief Medical Division National  
Headquarters Selective Service System  
WASHINGTON, D C

Selective Service appreciates the privilege of discussing with the American Medical Association through the Section on Preventive and Industrial Medicine and Public Health, the subject of rehabilitation. This is a matter of considerable national importance at the present time.

Perhaps the subject can be best approached by referring to the third statistical survey carried out by Selective Service and appearing as Medical Statistics Bulletin No 1. This affords a basis for discussion and perhaps for action. It indicates that, of the 2,000,000 men examined up to May 31, 1941, 1,000,000 were rejected by the examining boards of Selective Service and the Army. The breakdown according to symptoms is given in table 1. This must not be interpreted as indicating 50 per cent invalidism or sickness of registrants or as indicating 50 per cent crippling of the total population of the country. The survey does, however, reveal a high incidence of defects sufficient to dis-

TABLE 1—Causes for Rejection

|                       |           |
|-----------------------|-----------|
| Illiteracy            | 100 000   |
| Teeth                 | 188 000   |
| Eyes                  | 123 000   |
| Cardiovascular system | 96 000    |
| Musculoskeletal       | 61 000    |
| Veneral               | 57 000    |
| Mental and nervous    | 57 000    |
| Hernia                | 56 000    |
| Ears                  | 41 000    |
| Feet                  | 36 000    |
| Lungs                 | 26 000    |
| Miscellaneous         | 159 000   |
| Total                 | 1 000 000 |

qualify for combat service and hence responsible for 50 per cent reduction in I-A manpower for the Army. Most of the rejections were of men at work, men with hidden defects which they covered up as they carried on in civil life.

#### THE PRESIDENT'S PLAN OF REHABILITATION

The President, like the nation as a whole, was greatly concerned over the high incidence of defects and the resulting curtailment of the manpower of the Army. He therefore called a conference at the White House on Oct 9, 1941 of those most concerned in this problem. He said, in effect, that he did not believe that the standards of the Army were too high or the rulings of Selective Service or the army examining boards too rigid. He indicated his wish that Selective Service rehabilitate 200,000 men—the rehabilitation to be carried out as far as possible by the family doctors and dentists in the registrant's home town, selecting such cases as could be rehabilitated in a reasonable time and at a reasonable cost for which he said funds were to be appropriated. These instructions were verbal. Immediately following this, a conference was called at Selective Service Headquarters of representatives of all the great outstanding medical and dental organizations of the country. The plan was discussed in detail and

Read before the Section on Preventive and Industrial Medicine and Public Health at the Ninety-Third Annual Session of the American Medical Association Atlantic City N J June 10 1942.

also the chief difficulties involved. The latter concerned, essentially, two matters: (1) certification of competence of physicians and dentists for specific procedures and (2) the surgical risk involved in physical rehabilitation of those in need of operations. Some time passed before the executive order materialized and before the funds were made actually available for the carrying out of this plan. Plans were formulated after consideration was accorded all the legal, financial and governmental angles involved. The problem became one of considerable complexity.

The original plans of Selective Service were entirely changed by Pearl Harbor and the declaration of war. Prior to that time it seemed a simple matter to rehabilitate 200,000 of these registrants without employing surgical procedures. But after Pearl Harbor the increased need for men became imperative. This necessitated changing of the standards of requirement by the Army, especially as they relate to the teeth and the eyes. Then 1-B men came under scrutiny and, as recently announced by the press after August 1 they will be actually inducted in considerable numbers. It became apparent therefore that most of the minor defects scheduled for rehabilitation by Selective Service could and would be waived, so that the original group scheduled for rehabilitation became acceptable to the Army as they were and without undergoing rehabilitation of any kind.

Nevertheless, pilot tests in rehabilitation were set up in Virginia and Maryland in February, and splendid cooperation has been accorded us by the physicians and dentists in these two states. It was determined at national headquarters that only medical and dental cases would be rehabilitated, which greatly limits the numbers concerned.

The Director of Selective Service, appraising this position and bearing in mind a greatly altered picture, felt that the results of the limited pilot test did not justify the current adoption of a rehabilitation program on a nationwide basis, as far as the Selective Service System was concerned. Since the War Manpower Commission had been recently created by the President to coordinate all matters pertaining to manpower, the director felt it appropriate to refer the problem to that body for consideration and action.

However, the program adopted and the work done as far as it goes will probably be of interest to the medical profession. It was necessary to set up groups of designated physicians, dentists and facilities for each of these states. In fact, they have actually been set up in nucleus for all the states of the country. In medicine, for instance, a list of licentiates of the national boards was submitted as a nucleus to the state directors, who, with their medical directors and medical advisory boards, prepared their final lists of physicians and specialists for each state for designation by the director. Somewhat similar procedures were used in dentistry. Only hospitals approved by the American College of Surgeons and the American Hospital Association were approved as facilities. The Veterans Administration schedule of fees was adopted as a guide in the matter of remuneration for professional services.

The development of a plan of rehabilitation may be likened somewhat to the development of a plant for the manufacture of airplanes. There, buildings have to be constructed, machinery and personnel assembled and supplies secured. In rehabilitation, plans had to be formulated, personnel assembled, regulations written and forms provided. It has been frequently said that it is more difficult to turn out the first plane than the

next succeeding 999, and this applies with equal force to this plan of rehabilitation. However just as planes appearing on the line express real accomplishment in relation to the manufacture of planes, so the completion of rehabilitation of registrants and their acceptance in the armed forces indicate true progress. Rehabilitation has been completed in some instances and a small number of registrants inducted in both Maryland and Virginia, sufficient, however, to indicate the possibility of the plan.

These pilot tests to date have revealed the possibility of a plan of rehabilitation and the concomitant satisfaction of the registrants as well as that of the designated physicians and dentists executing the plan. They also indicated that the procedure employed must be simplified. This led to a conference at Selective Service National Headquarters on Tuesday, June 2 at which it was determined that certain changes were necessary in the regulations and forms, leading to greater simplification.

The present procedure will probably be of interest to doctors generally. The new examination form D S S 221, serves both Selective Service and the Army. On this form the Army specifies the defects to be corrected and returns the form to Selective Service which, through the machinery set up, aims to effect this rehabilitation and resubmits the man to the Army for his induction. The registrant remains in class 1-A throughout the rehabilitation procedure.

The defects listed as correctible by the Office of the Surgeon General include the following:

- Uncinariasis, if severe
- Chronic blepharitis, if mild
- Pterygium encroaching on the cornea
- Conjunctivitis, chronic, simple, moderate
- Deviation of the nasal septum which definitely interferes with nasal breathing
- Nasal polyp, unless severe and irremediable
- Such conditions as chronic diseases of the skin of the face which disqualify for general military service, provided the individual has successfully followed a useful vocation in civil life
- Pilonidal cyst or sinus
- Ringworm, if very severe and not easily remediable
- Scabies, if very severe and not easily remediable
- Cysts and benign tumors of the skin of such size and location as to interfere with normal wearing of military equipment
- Hammer toe with rigidity
- Other abnormalities which, in the opinion of the examining physician, are disqualifying but remediable and which have not prevented the individual from following a useful vocation in civil life
- Simple goiter unassociated with toxic pressure symptoms
- Enlarged lymph nodes and benign tumors of the neck of such size and location as to interfere with wearing of a uniform or military equipment
- Simple adenomatous goiter
- Thyrolingual cyst
- Small fibroid lesions
- Foreign body in the lung. A person may be accepted if a foreign body has been removed from a bronchus and examination shows recovery without disqualifying conditions
- Benign tumors of the breast or of the chest of such size and location as to interfere with the wearing of a uniform or military equipment
- Herma—inguinal, femoral, umbilical or postoperative—irremediable by surgical treatment
- Large benign tumors of the abdominal wall
- Internal and external hemorrhoids not easily remediable
- Single fistula in ano if careful examination shows absence of tuberculosis
- Stricture of the urethra unless severe and irreparable

Cystitis, subacute if deemed remediable  
Varicocele if large  
Hydrocele if large  
Undescended testicle which lies within the inguinal canal  
Venereal diseases Cases of gonorrhea with complications,  
chancroid infection, granuloma inguinale and lymphogranuloma  
venereum

Pellagra, beriberi, scurvy and other nutritional deficiencies  
if mild and remediable by correction of diet

Simple goiter with definite pressure symptoms or so large  
in size as to interfere with wearing a uniform or military  
equipment

Malaria acute severe or malaria chronic, unless severe

If the program of rehabilitation is limited to medical  
cases only it will prove relatively unimportant and  
unproductive from the standpoint of increasing man-  
power for the Army. Thus, in Virginia less than  
100 medical cases were involved, while some 1 600  
surgical cases are left in the backlog for future consid-  
eration and action. In Michigan for the month of Feb-  
ruary 1942 only 76 cases were listed as medical in  
nature, while there exists a backlog of 1 200 surgical  
cases. On the other hand if the scope is broadened to  
include all diseases specified for correction by the Sur-  
geon General's Office and the range extended to include  
all the states of the Union, the rehabilitation of regis-  
trants will constitute a project of great magnitude,  
one of the largest ever undertaken by American medi-  
cine. At present, many thousand registrants await a  
decision.

Irrespective of whether the plan is applied on a  
narrow or on a broad scale, or whether it terminates  
as a pilot test or is adopted on a nationwide scale,  
Selective Service has succeeded in creating a model  
which can serve the needs of the nation in the reha-  
bilitation of men with correctible defects for the military  
forces and, in the event of necessity, also in industry.

#### LOCAL PROGRAM OF VOLUNTARY REHABILITATION

Interest in the rehabilitation of registrants is wide-  
spread at present. This is evidenced by diverse types  
of rehabilitation programs being carried on by various  
organizations in different parts of the country. Only  
a few will be mentioned.

The Kansas State Board of Health, with the aid of  
the medical profession, is carrying on an active reha-  
bilitation program in relation to tuberculosis and  
venereal disease. They are caring for 355 of the 697  
men rejected for tuberculosis and 619 of the 1,165  
venereal cases rejected by the Army up to March 1,  
1942. In Massachusetts a committee of the National  
Hospital Association has been organized and is actively  
engaged in several phases of rehabilitation. In Colo-  
rado an active program has been in operation in the  
dental field for more than a year.

Perhaps the most interesting and effective programs  
at present are those of the Selective Service Head-  
quarters of New York City and of the American Flying  
Services Foundation. A report of April 7, 1942 from  
Colonel Samuel Kopetzky, Medical Director, New York  
City, states that 9 630 registrants have been written  
to, 7 637 interviewed and 3 996 referred to doctors,  
dentists or clinics and hospitals for appropriate care in  
the correction of their defects. This work has been on  
a purely voluntary basis. All military surgeons agree  
that unless registrants are eager to serve the mechan-  
ical correction of their defects can add but little to their  
effectiveness as soldiers, hence surgery should be  
reserved for those desiring it. In New York several

hundred surgical operations have been performed with-  
out fatality, mishap or serious complication of any kind.  
The American Flying Service Foundation, New York  
City, under the leadership of Dr. S. M. Strong, has  
limited its activities to the rehabilitation of men for  
service with the air force. Through the cooperation of  
doctors and dentists largely on a voluntary basis, some  
2 700 have been given appropriate guidance and 700  
cases have accepted surgery to date, without fatality or  
serious complications. Over 90 per cent of those reha-  
bilitated have been accepted for military service.

These few instances will serve to indicate the preva-  
lence of interest in the rehabilitation program and the  
nature, extent and value of some of the programs now  
in operation.

#### SOME BROADER ASPECTS OF REHABILITATION

The President's plan of rehabilitation provides for  
an increase of manpower for the Army through the  
correction of defects easy of remedy in a limited num-  
ber of registrants. This represents, as the President  
intended it, should a limited program for a very specific  
purpose. However, the statistical survey which focused  
his attention on the prevalence of defects in registrants  
also tends to suggest the existence of such defects among  
the public in general. Whether or not such is actually  
the case must remain a matter of conjecture unless  
substantiating evidence is derived from sampling surveys  
specifically designed to answer this question. Common  
sense, however, tells us that the possibility of these  
defects being limited solely to registrants is slight indeed.  
It seems inescapable that the statistical survey—though  
limited to registrants—indicates widespread existence of  
physical defects among the general population.

This of course, raises the question of national  
rehabilitation. The utopian solution of this problem  
would involve the immediate correction of all correctible  
defects, deficiencies, disorders and diseases among all  
who are their victims, an idealistic project of herculean  
proportions and one altogether impossible of attainment  
under existing wartime conditions.

The winning of the war is now, and should continue  
to be our sole objective. Therefore the scope of any  
program of rehabilitation now and at any time should  
be determined by the war needs.

This country, of its own free choice, has elected to  
become the "arsenal of democracy," and this involves  
the production of the "sinews of war" for ourselves and  
our allies. In this connection, industry and labor are  
called on for almost superhuman effort. The hitherto  
undreamed of demands of industry for manpower carries  
with it an unprecedented concomitant demand for medi-  
cal personnel and service.

Sickness and ill health takes a tremendous toll of  
manpower and industry. According to the recent Gal-  
lup poll, this is unbelievably large—400 000 000 man  
days lost annually. This can best be visualized by pic-  
turing a thousand plants each employing a thousand  
men, shut down completely for a whole year. This is  
a situation which medicine must recognize and attempt  
to remedy.

#### REHABILITATION AND PREHABILITATION IN INDUSTRY

A most illuminating article appeared in the pages of  
*THE JOURNAL* recently from the pen of Dr. William A.  
Sawyer, medical director of the Eastman Kodak Com-

pany, Rochester, N. Y. In the article, Dr. Sawyer states, among other things, that 1 The physical qualifications necessary to be an industrial worker are considerably less rigid than those demanded by our military forces. 2 The program of Selective Service bears a certain similarity to the industrial preemployment and preplacement medical examination for the selection and classification of workers. Here there are four groups: I Physically fit for employment—no defects or impairment. II Physically fit for employment—minor defects, easily correctible. III Physically fit for certain restricted employment. IV Physically unfit for any employment (rejected). 3 In certain well organized plants, class II correctible defects are employed and followed up periodically while working until the condition has been taken care of adequately. 4 Industrial medicine comes nearer to preventive medicine than any other branch of the entire practice of medicine. 5 Under the ideal situation it is possible that industry could institute a more positive program on behalf of Selective Service. Industry could review all eligibles and offer examinations and advice concerning the correction of defects.

In this article Dr. Sawyer has dealt not only with the problem of incidence of disease but also with possible methods of meeting the situation adequately. He suggests a plan through which by foresight and planning the workman may have access to the best medical service in his home locality rather than to the cheapest

#### PREHABILITATION

Prehabilitation is a word coined by the Medical Division of National Headquarters, Selective Service, to designate the correction of remediable defects prior to actual examination by Selective Service or the Army Examining and Induction Station. The plan is simple, is easily understood and can be readily carried out and should result in a pronounced diminution in the percentage of rejections and a proportionate increase in the number of men inducted into the Army of those physically examined.

The plan provides that (1) registrants familiarize themselves with the physical standards required, (2) that registrants apply to their local physicians and dentists if they fall short of the stipulated standards, (3) that family physicians and dentists correct defects if they are remediable and (4) that registrants carry certificates of prehabilitation to local induction boards at the time they present themselves for examination.

When this program of prehabilitation was first suggested, circumstances were not propitious. At that time much doubt existed in the minds of many of the young men of the country as to the need for their services in the Army. Since Pearl Harbor and our participation in the war, the line of duty has become well defined and doubt no longer exists as to the need, which now becomes not only apparent but imperative. With public support, prehabilitation can come into general acceptance and prevent an infinite number of unnecessary rejections, especially if applied to the group of young men just below the age of induction.

#### THE PRESENT NEED FOR COORDINATION OF MEDICAL SERVICES

The war has charged medicine with unprecedented responsibility. The medical needs of our medical forces, the increasing demands of our essential workers, the necessity of improving the quality of wartime service

through appropriate research and the customary requirements of the civilian population are all immediate and all pressing. Never has the doctor been more in demand, never has his opportunity for service been greater. Under such conditions wisdom in the allocation of his services is essential to the national well-being.

Because of this situation there has been set up in this nation, in the office of the Federal Security Agency, a national committee of doctors, "Health and Welfare Committee," under the able leadership of Mr. Paul A. McNutt. This agency is set up for the specific purpose of preserving the health and welfare of the people. The medical profession must realize now that its complete cooperation in this endeavor is absolutely essential to its success. Furthermore, certain other fields are under Mr. McNutt's jurisdiction, the War Relocation Commission and the Procurement and Assignment Service, the latter dealing with the equitable allocation of doctors, dentists and veterinarians. These facts turn cogent reasons for medical cooperation with him and the committee on Health and Welfare. However, cooperation should be active, not passive, in character. Medicine should formulate its own plans now and enter them to the coordinator of health and welfare so that he may utilize our services to the best advantage of the nation, and along lines we most approve.

The success of the nation at war is determined not only by the might of its arms but by the health and productivity of its people. National health can be placed on a higher plane only by the improvement of individual health. Individual health, the health of our military forces, and national health, all fall within the province of the physician. Rehabilitation must be determined by the national needs.

The present situation affords medicine a golden opportunity to determine how it best can serve the nation now, in its hour of need. Our profession present has the opportunity of exercising true leadership in the job of making America healthy, strong and productive. Thus American medicine can and must hasten the hour of victory.

#### ABSTRACT OF DISCUSSION

DR. JOHN A. FERRELL, New York. Colonel Rowntree's discussion as to the Army's lowering its customary standards with regard to vision and teeth but rigidly enforcing the exclusion of all young men having any mental or neurological disability interested me. I would appreciate if you would illustrate the milder types or grades of mental disability which would indicate rejection. Would stammering, spasm, chorea and neurotic tendency exclude a draftsman? Of the physicians, engineers, bacteriologists and chemists fall into this category might be drawn into the civilian services.

DR. L. G. ROWNTREE, Washington, D. C. Our standards for admission are set by the War Department by the Selective Service. We act somewhat like a factory service. We make allowance for shrinkage, breakage, order, distribute it and then bring in the number to the prescribed quota. I should not discuss the subject of physical and mental disease in detail since it would lead to a discussion. In Selective Service we are rejecting at present all who have been committed for mental disease or are epileptics. We have never believed that the deficient should be considered for rehabilitation. It has been discussed with the Surgeon Generals. In many cases it is exceedingly difficult to make a diagnosis. In reaching a conclusion in the short time allotted to examination, being the case, there has been more and more

on the psychiatric examination by the army examining and induction stations. There have not been enough psychiatrists to fill the needs of our 6403 local boards. We have also had great emphasis on the importance of the medical history and on the registrant's clinical record. We are attempting to have set up in every state in the Union a central bureau for the assembling of such information bearing on the mental status of these registrants. All the information made available to us is to be passed on with the registrant to the Army. The Army does not want mental defectives. It does not want even stutterers and stammerers unless the affliction is of a very mild nature.

## TOXIC AMAUROSIS DUE TO QUININE

TREATMENT WITH SODIUM NITRITE ADMINISTERED  
INTRAVENOUSLY

LOUIS PELNER, M.D.

AND

EDWARD SASKIN, M.D.

BROOKLYN

The widespread use of quinine by both physician and layman as a cold remedy, an analgesic and an eccholic as well as in the classic treatment of malaria would seem to merit the reporting of another case of a severe toxic reaction to this substance. The effects most frequently observed, even of ordinary therapeutic doses are disturbances of the sense of hearing and less frequently, a derangement of sight. In the case to be described tinnitus with moderate deafness developed, but the amaurosis that occurred completely overshadowed the loss of hearing.

The severity of the symptoms may be, and frequently is independent of the amount of quinine taken, since persons with sensitivity will show rapid and severe visual loss after swallowing a small amount of quinine in a cold remedy. Other persons will show such difficulties only after prolonged administration or after considerable overdosage.<sup>1</sup> Typically the patient will state that a curtain was drawn over the eye, beginning peripherally and finally causing central and total obscuration of vision. In cases of amaurosis the associated ophthalmologic observations are represented by dilated fixed pupils and a fundus picture of closure of the central retinal artery, i. e. noticeably narrowed retinal arteries somewhat dilated veins, intense retinal edema and a cherry red spot in the macula.

With the proper recognition of the condition and rapid therapeutic vasodilation the tendency is toward recovery with some loss of peripheral field. However cases of permanent blindness are on record.<sup>2</sup> Indeed one author stated that in every case of optic nerve atrophy without a demonstrable cause there should be a search for a possible sensitivity or toxic reaction to quinine.<sup>3</sup>

### REPORT OF CASE

S. P., a Negro woman aged 69 suddenly had chills and fever three days before calling for medical aid. She gave a history of having had a severe attack of malaria about twenty-five years before for which she had received quinine. How-

ever she stated later on closer questioning that her physician had discontinued administration of the drug after several days. Thereafter she used a concoction made by brewing grapefruit rinds and drank this as a form of tea. Since that time she had had many other attacks occurring at the rate of about one every two years for which she had not received medical attention but had used the grapefruit brew. The present attack began suddenly with a severe chill and a rise of temperature to 106° F. There were no pneumonic symptoms such as cough, production of rusty sputum or pains in the chest. The brew was administered without apparent effect because in approximately forty-eight hours another chill occurred and again the temperature rose. The patient was seen at this point by one of us (L. P.).

Physical examination revealed that she was emaciated, had pale mucous membranes and had a temperature of 106° F., a pulse rate of 120 and a respiratory rate of 26. There were no abnormal signs in the chest. The spleen was firm and enlarged to about 2 fingerbreadths below the costal margin. There was no enlargement of the liver. There were no hemorrhages on the mucous membranes or evidences of renal involvement. The blood pressure was 120 systolic and 80 diastolic. A diagnosis of chronic malaria was made. A blood count was performed, a blood smear made and quinine sulfate in doses of 5 grains (0.32 Gm.) ordered to be given three times a day. The blood count revealed 9000 white cells with 36 per cent polymorphonuclear leukocytes, 28 per cent lymphocytes, 12 per cent mononuclear leukocytes, 2 per cent eosinophils and 2 per cent basophils. Careful examination of a smear stained with Wright's stain showed some stippling of red blood cells and some young malarial parasites.

On the third day of medication after 40 grains (2.6 Gm.) of quinine had been taken the patient first complained of dimming of vision, ringing of the ears and moderate deafness. One more dose of quinine was given the patient by one of the family who attributed the symptoms to the malaria. Examination by one of us (L. P.) shortly afterward disclosed that the patient was totally blind and a fundus examination showed extreme pallor of the retina with a strong contraction of the blood vessels. The administration of quinine was immediately stopped and a cathartic was ordered. Prostigmine methylsulfate solution 1:2000 (2 cc. by hypodermic) was given at once for its vasodilating effect without avail. Sodium nitrite, 1 grain (0.06 Gm.) by mouth every two hours was also given without apparent effect.

On the morning of the fourth day after the quinine therapy was begun one of us (E. S.) examined the patient ophthalmologically. She was supine in bed apparently entirely unaware of her surroundings. The pupils were dilated to 7 to 8 mm. were slightly irregular and did not react to light directly or consensually nor was any effort to elicit a reaction to accommodation-convergence successful. Both lenses showed a few punctate cortical opacities and the vitreous of each eye also contained some fine punctate 'floaters'. The most dramatic ocular changes were in the fundi where a picture simulating bilateral closure of the central artery was seen. There was a large area of edema extending from each optic papilla temporally, passing above and below the macula and beyond it for a distance of about 1 disk diameter. A distinct cherry red spot was present in each macula. The retinal arteries were decidedly contracted while the veins were somewhat dilated producing a vein-artery caliber ratio of 4:1 instead of the usual 3:2. Both nerve heads showed blurring of the margins and a mild degree of pallor.

The digital tension in each eye was within normal limits. The vision in each eye was reduced to questionable light perception with no light localization.

In view of the severe visual impairment, the well defined contraction of the retinal arteries and the fact that prostigmine had not ameliorated the condition we felt that a more heroic measure should be employed. Accordingly 1 cc. of sodium nitrite solution (100 mg. To se) was administered intravenously.<sup>4</sup>

2 Duggan J. N. and Narayati B. P. A Case of Quinine Amblyopia with Central Color Scotoma of One Eye and Total Blindness in the Other. Brit J Ophth 15:164 (March) 1931.

3 Duggan J. N. and Narayati B. P. Quinine Amblyopia with Unusual Ophthalmoscopic Picture. Brit J Ophth 15:160 (March) 1931.

While the needle of the syringe was still within the vein, the patient dramatically declared that she experienced flashes of light before her eyes, photopsiae. Fundus examination one half hour later revealed a change in the vein-artery caliber ratio from 4:1 to 3:1, but no change in the degree of retinal edema. Four hours later another ampule of sodium nitrite was administered intravenously, after which the patient declared that she could see the bars of her windows, about 10 feet distant from her bed. At this time she was given a 2 per cent solution of ethylmorphine hydrochloride to be used topically, 1 drop in each eye three times daily, and tablets of vitamin B complex, two tablets to be taken twice daily.

Approximately four hours later another ampule of sodium nitrite was administered in similar fashion, and in about one hour she was able to distinguish the features of her children. During the morning of the next day another ampule was given. She was then able to recognize the primary colors on large test objects—25 mm in diameter. After the fourth injection, no more of the drug was administered. The following morning ocular examination disclosed that vision was 15/100 + in the right eye and 15/100 + in the left. The patient was hypermetropic, and refraction could not be performed in her home. The pupils were now 5 mm in diameter and reacted sluggishly to light directly and consensually and equally poorly to accommodation-convergence. There was only slight retinal edema, and the maculas appeared more normal by contrast. The vein-artery caliber ratio was now about 2:1, and it persisted at that value to the time of writing. There has been no recurrence of the fever and chills since the administration of quinine was discontinued. The patient was seen at the office of one of us (E. S.) approximately two weeks later. Her vision was now 20/100 in each eye and was improved to 20/30 + in each eye with a +1.75 D sph +0.50 C cyl axis 180, and she could read Jaeger type 1 with a +2.75 D sph added.

The pupils were now 4 mm in diameter and reacted promptly to light and accommodation-convergence. No retinal edema could be seen, and the vein-artery caliber ratio was still 2:1. The disk margins were still slightly blurred, and the mild pallor persisted. A perimetric examination with a 3 mm white target at 330 mm revealed an almost concentric 10 to 15 degree contraction in the visual field of each eye. The central color vision was normal. Peripheral field contraction is compatible with a toxic reaction to quinine and is to be expected.

#### COMMENT

There is still considerable difference of opinion as to whether the vascular change or the nervous degeneration is the primary lesion in the production of quinine amaurosis. Most recent work favors the vascular causation. Against this view, Marshall<sup>5</sup> stated that several observers have found that solutions of quinine salts when passed through the vessels of excised organs of warm blooded animals produce severe dilatation. Of course, these experiments were not in vivo, the organs having been dissociated from their various stimulative and inhibitive nervous elements. Druault,<sup>6</sup> after injecting quinine hydrochlorosulfate solution into dogs, found a rapid and early degeneration of the ganglion cell layers of the retina. He concluded that the quinine caused primarily a destruction of the retinal ganglion cells and the optic nerve and that the vasoconstriction played a further but secondary part in the degeneration of the nerve cells. Also, in support of this contention, cases have been reported of quinine blindness with no contraction of the retinal vessels.

The well known fact that the macular area (central vision) is relatively spared is an interesting point and

is difficult to explain. If we accept Druault's hypothesis that the quinine directly destroys the ganglion cells, keep in mind the central, relatively avascular area (the capillary loops surround but do not penetrate the central area 0.5 mm in diameter), a part of the retina is theoretically quinine free, and this portion of the perceptive apparatus is composed of the central and the adjacent ganglion cells. Thus the ganglion cells which are connected with the most centrally situated cones are located farthest from the quinine carrying blood vessels and escape destruction. This view is strictly theoretic.

On the other hand, successful modern methods of treatment, i. e. with peripheral vasodilators, seem to be proof that the initial lesions are vascular in nature and that the nervous elements, though touched, are not injured irreparably. It also seems that the vasodilating action should be on the muscular coat of the blood vessel rather than on the myoneural junction. De Bono<sup>8</sup> eliminated the role of the sympathetic nerve fibers in the vascular spasm when he injected a large amount of quinine into a semisympathectomized animal. The retinal spasm was most intense on the side in which the superior ganglion was removed. The lack of success in the present case of treatment with prostigmine (a peripheral vasodilator which acts by liberation of naturally occurring acetylcholine and is a sympathetic antagonist) would seem to favor this view.

The dramatic response to intravenous injection of a solution of sodium nitrite in the present case supports this view, since nitrites are known to act directly on the muscular coat of the vessel wall. It must be stated, however, that other investigators have obtained good results with acetylcholine<sup>10</sup> in the treatment of quinine amaurosis, although the treatment appeared to consist of many more injections than used.

#### THERAPY

The immediate discontinuance of administration of quinine is essential. Emesis and catharsis may be tried, but it has been shown that quinine appears in the urine about thirty minutes after a large dose is taken.<sup>7</sup> The prompt production of vasodilatation by inhalation of nitrites or by intravenous injection of sodium nitrite solution would seem to be the method of choice if any conclusion can be drawn from this case. Supportive stimulants, such as strychnine and digitalis, have their symptomatic indications but are not necessary in our case. Ethylmorphine hydrochloride was used locally for its vasodilating effect, and vitamin B complex was given because of its theoretic effect in protecting nerve structure.

#### SUMMARY

Complete amaurosis developed in a male patient treated with quinine. The total dose was 2.59 Gm. given over a period of three days. Intravenous injection of sodium nitrite solution produced a rapid and salutary effect.

FATAL POISONING FROM POTASSIUM  
THIOCYANATE TREATMENT OF  
HYPERTENSIONREPORT OF A CASE AND REVIEW OF  
THE LITERATURE

WILLIAM O. RUSSELL, M.D.

AND

WILLIAM C. STAHL, M.D.

ST. LOUIS

Since Westphal<sup>1</sup> in 1925 reintroduced the use of potassium thiocyanate for the treatment of hypertension varying and conflicting reports have appeared in the literature concerning the merits of this treatment. Barker<sup>2</sup> in 1936 reported favorably on the use of thiocyanate for the treatment of hypertension and again<sup>3</sup> in 1941 reaffirmed his opinion from a study of 246 patients observed for periods ranging from two to ten years. That this opinion is shared by other clinicians and that the thiocyanate treatment of hypertension is becoming more generally used is seen from the number of recent publications to that effect.<sup>4</sup> However, others have felt that thiocyanates were not only dangerous<sup>5</sup> in the treatment of hypertension but useless.<sup>6</sup> The toxic manifestations encountered in clinical practice with thiocyanate are well known and have been carefully considered by Wald<sup>7</sup> and others. Because of the well recognized toxic effects of thiocyanate, the Council on Pharmacy and Chemistry has never accepted it and in 1929<sup>8</sup> advised against its use in the treatment of hypertension.

In the case to be reported death resulted from thiocyanate intoxication. The fatal intoxication occurred following administration of the usually prescribed amount of the drug and the blood cyanates were always at supposedly nontoxic levels. This case is therefore of general interest, since it illustrates the need of scrupulously careful observations for the toxic manifestations of thiocyanate during treatment for hypertension because in certain individuals the usually prescribed

amount of the drug may prove fatal. The case report and a review of the fatal cases of thiocyanate poisoning reported in the literature may help to prevent this tragic sequel to an increasingly popular method of treatment of hypertension.

## REPORT OF CASE

**History**—A white man aged 52, American, single, a janitor, who entered the St. Louis County Hospital on Sept. 30, 1941, had been well and active until September 11, when he complained of a severe throbbing headache, dizziness and mental confusion. Because these symptoms were severe and disturbing he was admitted for the first time to the St. Louis County Hospital that same day. The essential points of the physical examination at that time revealed the heart slightly enlarged to the left with the left border of dullness 1 cm. past the nipple line. The heart sounds were regular and of good quality, with the aortic second sound much louder than the pulmonary second sound. The blood pressure was 234 mm. of mercury systolic and 140 mm. diastolic. The liver could be felt 2 cm. below the right costal margin on deep inspiration. There was 3 plus albumin in the urine, and the urea clearance was 27 per cent of normal in the first hour. The nonprotein nitrogen content of the blood was 43 mg. per hundred cubic centimeters. The ocular fundi showed significant tortuosity of the vessels with nicking of the veins by the overlying arteries. The clinical diagnosis was "cardiovascular renal disease with hypertension" and on the fourth hospital day he was started on a daily dose of 6 grains (0.4 Gm.) of potassium thiocyanate. Two days later, on September 16, the blood cyanates were 42 mg. per hundred cubic centimeters. All the symptoms complained of on entry to the hospital were relieved following seven days of hospital care which included bed rest, sedation with elvir of phenobarbital and 6 grains of potassium thiocyanate daily. At the time of discharge from the hospital, on September 18, his blood pressure had fallen to 190 systolic and 110 diastolic, and the blood cyanate level was 45 mg. per hundred cubic centimeters. He was advised to continue the daily dose of 6 grains of potassium thiocyanate and to report to the outpatient clinic in one week.

On September 25, one week after his discharge from the hospital, he was seen in the outpatient medical clinic and reported subjective improvement. The blood pressure was remarkably reduced, being 160 systolic and 100 diastolic, and the cyanate level of the blood was 152 mg. per hundred cubic centimeters. A note on the chart made by the attending physician stressed the need of careful observation of the patient for signs of cyanate intoxication in light of the low urea clearance test observed in the hospital. The drug was continued, however, and the patient was instructed to return to the clinic in one week.

The final admission to the hospital was on September 30. For the forty-eight hours before admission he had complained of profound weakness, had had some mental delusions and had become increasingly stuporous. The patient's family had noticed some jerking movements of both extremities that were not accompanied by loss of consciousness. There had been no vomiting, diarrhea or cutaneous eruptions but he had complained of a moderate itching of the skin. There was no history of symptoms of hypertension or treatment of hypertension prior to his first admission to the hospital on September 11. The past history, family history and marital history were irrelevant.

**Physical Examination**—The patient was well developed and well nourished. He responded poorly to questioning and only after repeated queries. The skin of his face was flushed, but there were no eruptions or ulcerations. Movement of the left side of the face was slightly impaired as compared to the right side. The heart was slightly enlarged to the left. The heart rate was regular and the heart sounds were of good quality with the aortic second sound slightly accentuated. The blood pressure was 180 systolic and 89 diastolic. The edge of the liver was palpable just below the right costal margin. The neurologic examination revealed slight weakness in the grip

of the right hand but no significant inequality of the superficial and deep reflexes on the right and left sides. The ocular fundi showed moderate vascular sclerosis but no hemorrhages.

**Laboratory Examination**—The leukocyte and erythrocyte counts and the hemoglobin content of the blood were normal. The reactions to the Kahn and Hinton tests were negative. The level of the blood nonprotein nitrogen was 39 mg per hundred cubic centimeters on admission. Subsequent determinations on October 6 and October 11 (the day of death) were 47 mg and 72 mg per hundred cubic centimeters respectively (as shown in the chart). Repeated examinations of the urine revealed only a slight trace of albumin on one occasion. The blood cyanate level taken on October 3, four days after admission, was 217 mg per hundred cubic centimeters. Subsequently on October 4, 6, 9 and 11 the level of blood cyanate was 192, 88, 189 and 174 mg per hundred cubic centimeters respectively.

Observations in case of poisoning from potassium thiocyanate

**Hospital Course and Treatment**—With the history of delirium, mental confusion, convulsive movements and the administration of potassium thiocyanate for hypertension together with a blood level of 156 mg of cyanate per hundred cubic centimeters reported in the outpatient clinic on September 25, a diagnosis was made of intoxication from potassium thiocyanate. For the first three days the patient was disorientated and had to be restrained in bed. Treatment consisted in phenobarbital for sedation, thiamine hydrochloride and forcing fluids. After the third day he had involuntary passage of urine, and the restlessness and the irrational mental state became progressively worse. The blood cyanates were 217 mg per hundred cubic centimeters on the third hospital day, and, in view of this high level of cyanate and the patient's increasingly poor condition, intravenous and subcutaneous dextrose was given in an attempt to facilitate and speed elimination of the cyanate by the kidneys. On the seventh hospital day the patient appeared slightly improved and the blood cyanates had fallen to 88 mg per hundred cubic centimeters, but the nonprotein nitrogen content of the blood had risen from 39 mg per hundred cubic centimeters on admission to 47 mg. His

general condition grew worse with increasing restlessness accompanied by periods of stupor, and on the tenth hospital day the blood cyanate level rose to 189 mg per hundred cubic centimeters. In spite of large amounts of subcutaneous intravenous fluids, the nonprotein nitrogen content of the blood on the twelfth hospital day was 72 mg per hundred cubic centimeters and the cyanate level had fallen but slightly to 174 mg. At this time the patient's condition was regarded as critical, and, in a final attempt to augment excretion of cyanate in light of the rising blood level of the drug and the even more disturbing rise of the nonprotein nitrogen content of the blood, 500 cc of 10 per cent dextrose with 2 cc of salyrgan was ordered every six hours. The temperature had fluctuated between 99 and 100.2 F, rose abruptly to 102.8 F at this time. The pulse rate was regular at all times and rose steadily from 80 beats per minute on admission to 135 on the tenth day. Respirations were regular and ran between 20 and 25 per minute. The patient died in the afternoon of the twelfth hospital day, following several hours of deep coma with the pulse remarkably slowed and the respirations shallow and rapid.

The clinical diagnoses were fatal intoxication from potassium thiocyanate, cardiovascular renal disease with hypertension, slight uremia and minimal cerebrovascular accident on the right.

**Necropsy**—Permission was given for examination of the thoracic and abdominal organs and the brain. The gross observations were as follows. The weight of the heart was slightly increased, being 430 Gm. The aorta showed a moderate number of slightly raised yellow plaques, and the coronary pulmonary and cerebral arteries showed only an occasional plaque. The kidneys were moderately reduced in size, the right weighing 107 Gm and the left 94 Gm. The capsules were removed with slight difficulty, revealing finely granular brown-red surfaces. Section of the kidneys showed the cortex slightly reduced in size but otherwise not remarkable. The lungs were edematous and moderately hyperemic. Except for a 2 by 2 by 0.5 cm area of old encephalomalacia in the cortex of the left temporal lobe of the brain, there were no abnormalities noted in that area. Determination of the amount of thiocyanate contained in the liver, kidney and heart muscle revealed 101 mg, 54 mg and 42 mg respectively per hundred grams of tissue examined.

Microscopic examination of the kidneys showed throughout the cortex scattered hyalinized glomeruli with focal accumulations of lymphocytes and plasma cells. Many of the renal glomeruli showed thickening of the basement membrane. The lumens of the arterioles were narrowed by proliferation of the intimal cells. Microscopic sections taken from the viscera were not remarkable.

The anatomic diagnoses were moderate arteriolar sclerosis, slight hypertrophy and dilatation of the heart, moderate arteriosclerosis of the aorta, slight arteriosclerosis of the coronary and cerebral arteries, old focal encephalomalacia of the left temporal lobe of the brain and moderate edema of the lungs.

#### COMMENT

The 9 cases of fatal thiocyanate poisoning here offer opportunity to make certain generalizations about the fatal toxic manifestations of this drug. In 6 of the cases the thiocyanate was taken therapeutically for hypertension, while in 3 it was taken with suicidal intent (cases 1 and 3) or with probable suicidal intent (case 2). The latter group of cases included in this study for consideration represent death from a single overwhelming dose of thiocyanate and are therefore instances of acute thiocyanate intoxication in man. The toxic effects of thiocyanates have been well studied in the past by Healy,<sup>9</sup> Nichols,<sup>10</sup> Wald<sup>7</sup> and others.

<sup>9</sup> Healy J C Therapeutics and Toxicology  
New England J Med 205 581 583 (Sept 17) 1931  
<sup>10</sup> Nichols J B The Pharmacologic and Therapeutic  
the Sulfocyanates Am J Med Sci 170 735 747 (A) 1925

pointed out essentially the same clinical signs and symptoms and pathologic changes reported in the experimental animals were observed in the human cases reported

There are sufficient clinical data available on the 6 cases in which thiocyanate was given for hypertension to allow adequate generalization about the signs and symptoms that are produced by this type of thiocyanate

\* Thiocyanate not taken for hypertension.

† Thiocyanate taken for hypertension.

intoxication From these cases it appears that thiocyanate intoxication resulting from repeated small doses of the drug as given in the treatment of hypertension produces a uniformly characteristic clinical syndrome. The first symptom usually complained of by the patient is profound weakness, which is probably due to the lowering of the blood pressure as the concentration of the drug reaches toxic levels. Symptoms of a toxic psychosis characterized by delirium, hallucinations, mental confusion and mental stupor were recorded in 5 of the cases. The appearance of any symptom suggestive of a toxic psychosis in a case in which thiocyanate is being administered should be regarded as adequate evidence of thiocyanate intoxication and possibly of a highly serious nature. All the patients having a toxic psychosis at some time during the course of the disease showed irregular convulsive movements, evidencing further the toxic effect of the cyanate on the central nervous system. Death in this group of patients occurred from three to nineteen days after the onset of the first symptoms and was preceded by a period of deep coma. These were essentially the same symptoms of intoxication noted by Nichols<sup>10</sup> and others working with experimental animals.

The amount of thiocyanate taken and the duration of the treatment in the 6 cases in which thiocyanate was given therapeutically for the hypertension is of interest and merits special comment and consideration, for in all instances the patient received no more than the standard and accepted therapeutic dose, as shown in the table. It is extremely interesting that in this group of patients the maximal amount of drug taken by any 1 patient was 15 Gm over a period of ten days. The smallest amount of drug taken was in the case reported by us, in which but 5.6 Gm of potassium thiocyanate was administered over a period of fourteen days. The blood cyanate levels were determined in the case reported by Garvin and the case we have contributed. The highest level of blood cyanate recorded in Garvin's case was 187 mg per hundred cubic centimeters, and the highest level in our case was 21.6 mg. Serious toxic manifestations are not supposed to occur at these levels, for according to Barker<sup>2</sup> the "optimum therapeutic level [of cyanate] would seem to range between 8 and 12 mg per hundred cubic centimeters" and that "significant toxicity begins to appear at from 15 to 30 mg." Barker further stated that "toxicity increased rapidly above the blood cyanate level of 20 mg, but serious manifestations were not noted until levels of 35 to 50 mg were reached." More recently Barker<sup>3</sup> has recorded a blood level of 45 mg per hundred cubic centimeters in a case in which an uncontrolled amount of thiocyanate was taken without fatal outcome with only symptoms of delirium and hallucinations. No doubt the levels of toxicity as given by Barker are applicable for the great majority of individuals, but certainly in rare instances a blood cyanate level of 15 to 21 mg per hundred cubic centimeters may be fatal, as the cases in this study illustrate. While the level of blood cyanate was studied in only 2 of the 6 cases treated for hypertension, essentially the same dosage was administered in the other 4 cases over comparable periods of time, whereby it may be reasonably assumed that the blood cyanate values in those cases could not have exceeded significantly the levels in the cases in which the blood cyanates were determined. It seems, therefore, that these cases are particularly instructive since they clearly demonstrate that in rare instances the usually prescribed therapeutic

dose of thiocyanate may prove to be a fatal dose. Apparently some individuals have an idiosyncrasy for the drug and have little or no margin of safety between the therapeutically effective dose and the fatal dose. This point has been stressed by Goldring<sup>11</sup> and by Garvin.

In 3 of the 6 cases in which thiocyanate was administered therapeutically complete necropsy studies were made, and in no instance was there any demonstrable anatomic change that could be directly attributed to the effect of the drug. These cases all showed various degrees of arteriolar nephrosclerosis and the usual effects of hypertension. Judging from the concentration of the thiocyanate in the body tissues in our case in the case reported by Goldring<sup>11</sup> and in experimental animals,<sup>7</sup> thiocyanate is stored in all the tissues of the body, and the blood level is dependent on and follows closely the concentration of the drug in the body tissues. The action of thiocyanate in hypertension is dependent on a thorough saturation of body tissues in order to attain sufficiently high blood levels to alter the vasomotor of the blood vascular system. However, the exact mechanism of action of the thiocyanate in lowering blood pressure is not definitely established. The fact that large quantities of thiocyanate must be stored in the body in order to reach a sufficient blood concentration to attain a therapeutic result creates a real hazard to the patient who shows signs of toxicity, since all patients with hypertension have some degree of kidney damage which makes the elimination of the thiocyanate uncertain and unpredictably variable for each patient. The impaired kidney function of our patient was undoubtedly an important factor in the fatal outcome, for there was good improvement until the seventh hospital day, when the nonprotein nitrogen content of the blood rose significantly. The blood cyanates had fallen to 8.8 mg and the patient's general condition had improved but following the rise in the blood nonprotein nitrogen the thiocyanate again rose and the patient's condition steadily worse.

Three of the cases (1, 2 and 3) are instances of acute intoxication from thiocyanate with death resulting from a single dose of the drug. The amount of drug taken in case 1 is unknown but must have been large, for death occurred within ten hours and there was necrosis of the mucosa of the gastrointestinal tract. In case 2 the stated amount is probably not correct, because 0.3 Gm of thiocyanate is too small a quantity to cause death, which was attended by the same clinical signs and symptoms as in the other 2 cases and is undoubtedly due to thiocyanate. It is impossible to determine accurately the amount of drug taken by the third patient but it must have been considerable, for a 100 Gm quantity of thiocyanate was found beside the patient and a few crystals of the drug remaining in the bottle.

These 3 cases are interesting as examples of the clinical symptoms and pathologic changes produced by acute thiocyanate intoxication. In 2 of the cases the clinical signs and symptoms are described, and in 2 cases (not the same 2) a complete necropsy was performed. Judging from the results it can be said that acute thiocyanate intoxication results in convulsions, coma and death in from twelve to twenty-eight hours. The drug, if taken in sufficient concentration, may have a corrosive effect on the

membranes of the gastrointestinal tract (case 1) causing extensive necrosis of the mucosa with hemorrhages. These observations are in full agreement with the results of acute thiocyanate intoxication in animals reported by Nichols<sup>10</sup>

## SUMMARY

A case of fatal poisoning from potassium thiocyanate used in the treatment of hypertension was observed. Death in this case resulted from the ingestion of 5.6 Gm of potassium thiocyanate given in 6 grain daily doses for a period of fourteen days. This is less than the usually prescribed amount of thiocyanate for the treatment of hypertension. Five other cases of death from thiocyanate employed in the treatment of hypertension have been collected from the literature thus making a total of 6 cases reported to date. In all the cases a definite clinical syndrome developed characterized by profound weakness and toxic psychosis with delirium, hallucinations, mental confusion and convulsive movements. The maximal amount of thiocyanate administered in any 1 case was 14.4 Gm over a period of eighteen days. The highest concentration of cyanate in the blood was in the case contributed by us here on one occasion 21.7 mg per hundred cubic centimeters was reported. Necropsy studies obtained in 3 of the 6 cases revealed no characteristic pathologic change that could be attributed to thiocyanate intoxication.

Three other cases of fatal thiocyanate intoxication have been collected from the literature in which the thiocyanate was not taken for hypertension. In each instance a single large (presumably so in 1 case) dose caused generalized convulsions and death in from ten to twenty-four hours. The drug was taken with suicidal intent by 2 of the patients and probably by the third patient also. The concentration of thiocyanate was sufficient in 1 of the cases to produce extensive necrosis of the gastrointestinal tract. These 3 cases are therefore instances of acute thiocyanate intoxication in man and clearly demonstrate that thiocyanate, if taken in sufficient quantities, can produce an acute and fatal poisoning.

## CONCLUSIONS

The thiocyanate treatment of hypertension is not free from complications which may even be fatal. In rare instances the dose of thiocyanate usually prescribed and regarded as safe for the treatment of hypertension produces a fatal intoxication, as shown by 6 of the cases collected for this study. In patients showing such an extraordinary toxicity from thiocyanate, a blood cyanate level of from 15 to 20 mg per hundred cubic centimeters should be regarded as critical.

**One Bowel Movement in Thirty-Four Days**—As I look back on those thirty-four days, rains and suns, heavy seas and flat calms merge and nothing comes out but a feeling of hunger and thirst and sadness. Yet there are some things I remember well like the day Aldrich caught the four-foot shark. He stabbed it in the gills and yanked it out of the water. Its skin was so tough that Tony had to hold the tail and Gene the head while I slit open the stomach. We ate the liver first. Next we explored the stomach finding two six-inch sardines. We gave Aldrich one as he had caught the shark, and Tony and I shared the other. Never have I tasted anything better. We devoured the rest of the shark's innards. Then we held up the head and tail forming a pocket in the middle into which the blood poured. It had a strong flavor but we drank it. Finally we ate as much flesh as we could. Incidentally it acted as a physic. Each of us had the only bowel movement on our thirty-four days at sea—Dixon Harold F. Three Men on a Raft, Life, April 6, 1942.

## Clinical Notes, Suggestions and New Instruments

### EMPIEMA COMPLICATING A PARAPHARYNGEAL ABSCESS

EDWARD PRESS, MD, E. GLISHTOWN, N. J. AND  
HARRY S. ALTMAN, MD, BRONX, N. Y.

Empiema as a complication of parapharyngeal abscesses is rare and generally occurs by spread from a mediastinitis.<sup>1</sup> The occurrence of empiema in the absence of mediastinitis is extremely rare and, although Grodinsky<sup>2</sup> described a direct connection between the axilla and one of the fascial spaces of the neck we have been unable to find previous reports of an abscess extending into the pleura from this space. The following is a case report of this condition.

## REPORT OF CASE

N. P., an Italian girl aged 3 years, entered Lincoln Hospital on June 11, 1941 with the complaints of fever, irritability, and pain in the left axilla. The birth and development had been normal. At 7 months of age she had pertussis followed by pneumonia. Although the patient was subject to frequent colds, especially in the winter she had had no other serious illnesses. Two weeks before admission she received a second degree burn of the left forearm which was apparently healing well. Five days prior to admission there was the sudden onset of fever, irritability and vomiting. The following day, because of the persistence of fever she was seen by a local physician, who diagnosed the disease as tonsillopharyngitis. For the next two or three days the fever abated and the patient was apparently well. On the day preceding admission fever and vomiting recurred and this was followed in several hours by the sudden onset of pain in the left axilla. This pain was a sharp and sticking one and was aggravated by inspiration. There were no other complaints and the system review was negative.

The physical examination revealed that the patient was well developed and well nourished. She appeared only moderately ill although her temperature was 103 F. A diffuse punctate erythema was present over the trunk and extremities and was confluent in the left axillary region. The postauricular and cervical nodes were bilaterally palpable and the left axillary nodes were enlarged to the size of hazelnuts and were definitely tender. There was a well healed scar approximately 5 by 2 cm on the left forearm. The tongue was coated and hypertrophied papillae were seen. The tonsils and pharynx were diffusely injected and an enanthem was present. A profuse postnasal discharge was seen, but no bulging of the pharynx or faucial pillars. There was a short systolic murmur over the pulmonic area, the heart rate was 150 per minute and the respiratory rate 30. The remainder of the examination was essentially negative.

Urinalysis revealed 1 plus albumin, rare red blood cells, 4 to 5 white blood cells and the same number of granular casts per low power field. The hemoglobin content of the blood was 120 Gm, the red cell count 3,920,000, the white cell count 13,720 with 72 per cent polymorphonuclears and 6 per cent eosinophils. The Dick and Schultz-Charlton tests were negative and a throat culture was reported as Streptococcus gamma, Proteus vulgaris and Staphylococcus albus. The blood culture was negative.

The admission diagnosis was tonsillopharyngitis and left axillary adenitis probably due to an infection of the burn of the left forearm. With the disappearance of the rash on the following day, the absence of hemolytic streptococci in the throat and the negative Dick and Schultz-Charlton tests the tentative diagnosis of scarlet fever was discarded. Because of the combination of severe tonsillopharyngitis and axillary lymphadenitis sulfathiazole was administered. In spite of this after twenty-four hours the patient's condition became worse, breathing was labored and rapid (46 per minute) and a diffuse

From the Children's Medical Service of Lincoln Hospital, Bronx, N. Y. Dr. Harry S. Altman, attending pediatrician.  
1. Grodinsky, Manuel. Retropharyngeal and Lateral Pharyngeal Abscesses. An Anatomic and Clinical Study. Ann. Surg. 110: 177 (Aug.) 1939 (case 6).  
2. Grodinsky, Manuel and Holyoke, E. A. The Fascia and Fascial Spaces of the Head, Neck and Adjacent Regions. Am. J. Anat. 62: 367 (Nov.) 1938 (p. 394, page 4).

swelling was noted in the region of the left axilla with pain on extension of the arm above the shoulder. A roentgenogram of the chest on the day following admission revealed a decrease in illumination of the left pulmonary field but no other evidence of a pulmonary lesion. This and the decrease in resonance and breath sounds were attributed to the soft tissue swelling. On the third hospital day the swelling in the left axillary region had spread so that there was a diffuse nonpitting edema over the entire left side of the thorax anteriorly and posteriorly. The patient appeared extremely toxic, the temperature was 106 F and in spite of supportive measures she died fifty-three hours after admission.

Postmortem examination revealed an acutely inflamed pharynx and larynx. There were several enlarged nodes in the left cervical region. In the left lower portion of the neck, extending downward to the posterior border of the clavicle, an abscess was found. This was about 5 cm in diameter, contained a small amount of pus and was fairly well walled off with fibrous tissue. A tract could be seen extending laterally from this abscess toward the left axilla and passing just outside the pleura over the apex of the lung. Large lymph nodes showing acute inflammatory changes were present in the left axilla. In the area where the soft tissue swelling had been, and involving chiefly the pectoral muscles, the muscle fibers were diffusely swollen and pale. The left pleural cavity contained about 150 cc of a thin, yellow, purulent fluid. The mediastinum and pericardium appeared normal and there were no signs of osteomyelitis of the cervical vertebrae or thrombosis of the axillary vessels. The burn of the left forearm was found to be well healed and there was no evidence of a purulent infection. Smears and cultures from the pus in the cervical abscess, from the edematous muscle tissue and from the empyema fluid revealed beta hemolytic streptococci in all.

#### SUMMARY

A case was observed in which a parapharyngeal abscess burrowed laterally, to rupture into the pleura in the axillary region causing empyema, myositis and death.

#### ACUTE TOXIC EFFECTS OF MERCURIAL DIURETICS

WILLIAM H. HIGGINS, M.D., RICHMOND, VA

Mercurial diuretics were introduced into general use about twelve years ago. It was early demonstrated that acute renal lesions were definite contraindications to their employment, but with this exception there was no particular danger even when given over a long period of time. However, in 1937 Greenwald and Jacobson<sup>1</sup> reported 2 cases and Wolf<sup>2</sup> a third case of sudden death following an intravenous injection of a mercurial diuretic. Recently Tyson<sup>3</sup> has added 1 more fatality and 1 near fatal reaction immediately following this therapeutic procedure. In this entire group there were both clinical and typical postmortem changes indicative of a chronic lipid nephrosis.

#### REPORT OF CASE

A. H., a man aged 53, was admitted to Stuart Circle Hospital with a history of hypertension for from eighteen to twenty years. He had been symptom free until two years before admission, when following an attack of influenza swelling of his ankles and a persistent cough developed. Four months later, after a second respiratory infection, he began having dyspnea with increasing edema of his dependent parts. At this time evidences of cardiac decompensation made their appearance which responded reasonably well to digitalis medication.

On examination he was somewhat dyspneic, moist rales were heard over both bases and there was edema of the legs, the lower part of the back and the buttocks. His heart showed general enlargement and his blood pressure was 175 systolic and 100 diastolic. An electrocardiogram revealed evidences of moderate myocardial damage. Renal studies revealed blood urea 39 to 100 mg per hundred cubic centimeters of blood, cholesterol

174 to 258 mg, chlorides 487 mg, creatinine 17 to 26 mg, uric acid 4.1 mg, and total proteins 5.54 mg (albumin 0.9 mg, globulin 1.4 mg), return of phenolsulfonphthalein was 20 per cent the first hour and 17 per cent the second hour.

During his three months' hospitalization about ten doses of salyrgan or mercupurin were given, approximately one being administered intravenously and the rest intramuscularly. Following the fourth dose (2 cc intravenously) the patient

Fig 1—Clinical graph showing evidences of a circulatory collapse following intramuscular injection of 1 cc of mercupurin. Recovery in twenty four hours.

had a chill associated with dyspnea and slight pulmonary edema and was emotionally upset. This episode was partly diagnostically, but the absence of a known relationship of the drug to such a reaction it was tentatively dismissed as an unsolved coincidence. Two weeks later the edema became more pronounced. In the use of mercupurin was cautiously given intramuscularly. About one hour after this injection a severe chill, fever, dyspnea, rapid fall in blood pressure and prostration developed in rapid succession. Figure 1 shows the sequence of events which time death seemed imminent. After a period of four hours the acute symptoms subsided and his general condition remained unchanged until one month later, when he suddenly, presumably from a coronary occlusion, died. He was removed for study by Drs Beck and Howe, who reported that the kidney weighed 203 Gm and measured 12.5 by 5.5 cm. The kidney was moderately enlarged and pale, appeared swollen. (This may have been due to emboli in the arteries coming off from the hilus, the superior renal artery branching before entering the kidney substance. The arteries showed definite arteriosclerotic changes.)

The ureter was grossly normal. What appeared to be cysts averaging 1 mm in diameter could be seen beneath the capsule over the entire surface of the kidney. The capsule stripped readily, leaving a finely granular gray surface. No gross changes were noted. Gross section showed the cortex to be 10 to 15 mm in depth. The cortex was pale, the medulla showed an increase of fat.

**Microscopic Description** The glomeruli were of normal cellularity. A few were hyalinized and numbers of them were shrunken and atrophic, so that they filled only half of the space, even in these shrunken glomerular tufts, however, density was not greatly increased. Many of Bowman's capsules contained pink staining albuminous material, but no red blood cells or leukocytes were seen. Occasional arterioles showed thickening and hyalinization of their walls, this was more pronounced, however. In the cortex there were small areas of scarring and round cell infiltration. The tubules were depressed below the cortical surface. The tubules showed moderate dilatation, which was most pronounced in the convoluted tubules. Their lumens contained pink staining debris. The tubular epithelium was granular and contained numerous vacuoles. In a few scattered areas the epithelium was largely replaced by a granular deep purple stain which was present also in the lumen and interstitial tissue.

Fat stains (sudan III) showed small amounts of fat in the tubules. The vacuoles described did not take the stain.

The pathologic diagnosis was arteriosclerosis of the kidney, mild, vacuolic disorder (due to fat). Very slight necrosis and calcification of the tubules, probably due to mercury (fig 2).

<sup>2</sup> Wolf, I. J., and Bongiorno, H. O. Sudden Death with Salyrgan, *Canad. M. A. J.* 25: 73-75 (July) 1931.

<sup>3</sup> Tyson, Mary C. Danger of Intravenous Mercurial Injections in Nephrosis, *J. A. M. A.* 117: 998-999 (Sept. 20) 1941.

## COMMENT

The fact that similar symptoms followed the administration of the drug on two occasions is highly indicative of a causal relationship. The prompt recovery within twenty-four hours and the absence of any electrocardiographic evidence during the critical period make any acute cardiorespiratory lesion wholly improbable.

The cause of these reactions is unknown. Tyson concluded that the nephrotic syndrome was a definite contraindication to the use of mercurial diuretics in view of the fatalities previously reported. However, the case in question is unique in that it showed no clinical or postmortem evidence of a lipoid nephrosis, but there was an arteriosclerotic nephritis with necrosis and calcification of the tubules. It has been suggested that these areas of necrosis may have resulted from the mercury to which the tissues were hypersensitive. It is possible that the reaction following the mercurials is an anaphylactic one similar to those occasionally encountered after the administration of arsenicals. The fact that part of the injections was given intramuscularly supports this idea. According to Landsteiner, when a foreign agent even a chemical is injected into the muscle contact with the local tissues may bring about the formation of a conjugate antigen with the body's own protein thus sensitizing the individual. Should this explanation be the *modus operandi*, the method of giving mercurials during a series should not be alternated, as a resulting shock dose may precipitate a catastrophe.

A brief note by Friedfeld and his associates<sup>4</sup> on a number of fatal and extremely serious reactions following intravenous injections of mercurials suggests the possibility of a drug irregularity and recommends that until further investigation mercurpurin be given intramuscularly. The fact that all the reported serious reactions have occurred in the last four years bears out their impression that the mercurials now in use may be different from those on the market prior to 1937.

Fig 2.—Section of kidney removed from patient dying one month after severe toxic reaction following an intramuscular injection of mercurpurin. In addition to evidences of an arteriosclerotic nephritis there are seen on section small areas of necrosis and calcium deposits suggesting mercurial damage.

Mercurial diuretics have been universally accepted as valuable therapeutic agents and their use should not be discouraged without unimpeachable evidence. However, the number of fatalities reported within the last four years is entirely too high to pass without comment, and therefore the toxicity of these

products should be investigated. Contrary to the opinion of previous commentators, these untoward effects occur not only in lipoid nephrosis but also in nephrosclerosis, as has been demonstrated in this report.

### HANDBOOK OF NUTRITION IV

#### CALORIES IN MEDICAL PRACTICE

EUGENE F. DU BOIS, M.D.

AND

WILLIAM H. CHAMBERS, PH.D.

NEW YORK

*These special articles on foods and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition—Ed.*

Calories in medical practice are just as important as they ever were, in spite of the fact that attention has been centered on the vitamins. No supplements of vitamins or mineral elements can alter the laws of the conservation of energy. Calories are still needed to keep the body warm and to furnish energy for muscular work.

Calories, or British thermal units, form the basis of calculations in engineering, in the estimation of the heating values of commercial fuels and in the estimation of the feeding of populations. Perhaps in the latter connection they may determine the outcome of the present war. A physician, however, is directly concerned with calories in relatively limited fields. He must know the calories of the basal metabolism, he must understand the construction of an adequate diet in both health and disease and he must know how to construct high or low calory diets that contain the essential food elements. Although he does not often realize it, he is intimately concerned not only in the administration of calories in the food but also in their dissipation through the surface of the body. It is the temporary disproportion between gain and loss that causes the ups and downs of fever.

The unit of heat measurement that concerns the physician is the large calory, the kilocalory, the amount of heat required to raise 1 Kg. of water 1 degree C. The small calory, the amount required to raise 1 Gm. of water 1 degree C., is a unit employed by physicists and chemists for the calculation of energy changes in intermediary metabolism and is so seldom mentioned by physicians that it is rarely found in medical literature. When employed clinically, it causes endless confusion. The British thermal unit is the heat required to raise 1 pound of water 1 degree F. and equals 252 small calories. Fortunately this term is not used in medical literature. The amount of heat given off by the resting man of average size is about equal to the heat of a 60 watt electric bulb or the flame of an alcohol lamp about 1 inch high. A man exercising hard equals the heat of ten such lamps. Most of us fluctuate between these two extremes in the course of a day, and it is extremely difficult to make a really accurate estimate of the number of calories that a person consumes on any one day.

<sup>4</sup> Friedfeld, Louis, Kissin, Milton, Modell, Walter and Sussman. *Ralph Mercurpurin*, correspondence J. A. M. A. 117: 1806 (Nov. 22) 1941.

The basal metabolism or basal metabolic rate is a term generally employed to indicate the heat production of a person fourteen or more hours after the last intake of food at complete physical and mental rest in a comfortable environment. This is sometimes called the postabsorptive metabolism, or standard metabolism, theoretically better than basal metabolism because the lowest metabolism is found during sleep or inanition or after the removal of the thyroid gland. Basal metabolism is most conveniently measured early in the morning in the person who has come to the laboratory without breakfast with relatively little physical exertion. Persons in good health can travel for as much as an hour before the test and be in basal condition after resting for one-half to one hour. A person moderately ill with toxic diffuse goiter may be affected by an automobile ride of one-half hour. One who is seriously ill should have the test made in the same building in which he spends the night. The stimulating effect of food, the specific dynamic action, is slight ten hours after the last meal unless that meal has been a heavy one. Even

"The test I had in Dr. Blank's office was about 20 per cent too high."

First tests on inexperienced patients or normal controls are usually 5 to 10 per cent higher than subsequent tests. Most of the older standards of metabolism were based largely on first tests and are therefore 5 to 10 per cent too high when applied to the more modern series of controls founded on results obtained with experienced subjects. It may therefore be said that normal trained healthy subjects average 5 to 8 per cent below the so-called Aub-Du Bois standards of 1917, or the Mayo Clinic Boothby, Berkson and Dunn standards of 1936, or about 3 per cent lower than the Harris-Benedict standards. The Aub-Du Bois standards were much too high for children, and the Biering figures for the boys and the Kestner-Knipping tables for girls are more accurate for well trained children.<sup>1</sup> Some day there will be more satisfactory physiologic standards, but even after the thousands of determinations that have been made on normal subjects it is too soon to settle on a new level, since the average normal is still rising slightly every decade. Some recent work by Hardy and Milhorat<sup>2</sup> showing the effect of temperature in changing the metabolism of women but not of men was disturbing. On the average the metabolism of women is 10 to 12 per cent lower than that of men of the same size, but in a cold environment it may be the same as that of men and in a very warm environment may be 15 to 20 per cent lower. In spite of all these limitations clinicians get along quite well with the old standards to which they are accustomed, estimating that for well trained subjects and good satisfactory tests the normal persons come within +5 to -20 per cent of the so-called standard. Some few normal persons are 5 per cent further off in either direction. Boothby, Berkson and Dunn<sup>3</sup> have emphasized the fact that a person toward the limits of the normal range may be normal but that the chances are greatly against it. Conversely, some exceptional persons with pathological low or high metabolism may come within the normal range. The basal metabolism by itself should be considered merely as one piece of evidence and never a final answer. One book on metabolism ends with the sentence "God forbid that we make our diagnostic machinery."

It must be admitted that the basal metabolism tests are seldom of great value except in the diagnosis and treatment of diseases of the thyroid gland. The majority of basal metabolism tests, like the vast majority of roentgenograms, show normal conditions. It is necessary to avoid missing cases which present atypical histories but which do not show the usual signs. Basal metabolism tests and other laboratory tests are probably overdone, but it is doubtful what can be remedied.

There are obviously many factors which influence total heat production apart from those of size, age, sex that are used in calculating the basal metabolism. Some of the more important factors are shown schematically in figure 1. This illustrates not only heat production but also heat loss and shows how one factor may be offset by the other. Ordinarily, any increase in heat

Fig. 1—Balance between the factors increasing heat production and heat loss

a small breakfast has little effect after three or four hours. Much more serious than the 2 to 3 per cent increase from a small breakfast is an increase of 10, 20 or even 50 per cent which may be caused by fear, apprehension or discomfort shortly before or during the test. The most important precaution is prevention of such tension by means of preliminary tests, careful explanation on the part of the physician and a quiet atmosphere during the test. A high percentage of determinations in toxic diffuse goiter are ruined because the patient has been told by her friends or even by her physician that the results will decide whether or not she is to have an operation.

After the test has been made the physician should always try to form an estimate of the emotions during the whole procedure. He should note carefully the pulse rate before and during the test and compare it with the rate obtained while the patient was in bed on other days. A significant rise in pulse rate usually indicates an unreliable determination. The physician should also question the patient regarding apprehension and discomfort. An experienced patient may tell you

1 Webster, Bruce, Harrington Helen and Wright F. J. 19 347 (Sept.) 1941  
2 Hardy, J. D. Milhorat A. T. and Darr F. F. J. 21 383 (April) 1941  
3 Boothby W. V. Berkson, J. and Dunn H. L. 116 468 (July) 1936

by an increase in heat production and vice versa with a balance so delicate that the body temperature is maintained with extraordinary uniformity. In health it is only on occasions when heat production is greatly and suddenly increased that heat loss lags behind causing a rise in body temperature. Nevertheless a short bout of hard exercise can raise the rectal temperature to 38 to 39 C (100.4 to 102.2 F) for half an hour. Conversely, a sudden change to a cold environment without compensating exercise can cause a drop in temperature.

Basal heat production may have superimposed on it the specific dynamic action of food. After a heavy meal of protein or carbohydrate or both there is a gradual increase in metabolism perhaps rising 30 to 40 per cent above the basal rate in two or three hours and then falling slowly. After ordinary meals the rise is less noticeable but when distributed throughout the twenty-four hours under ordinary conditions the total specific dynamic action amounts to about 6 per cent of the total caloric value of the food. This is small in comparison with the large increase that might be caused by certain diseases such as hyperthyroidism with figures of 15 to 100 per cent or more above the basal rate. The unconscious tensing of the muscles that accompanies apprehension may raise the heat production 10 to 20 per cent without its being noticed by an inexperienced observer. Moderate activity causes a rise of 20 to 50 per cent, whereas hard exercise may increase the metabolism three or four or even ten fold. When there is fever there is an elevation of about 13 per cent for each degree centigrade, but the variations are considerable.

Heat loss may be an important element in raising heat production. If a man goes into a cooler environment or is exposed to a strong wind or takes off some of his clothing, or even stretches so that he exposes a larger surface, he loses more heat and in order to compensate the body has to produce more calories. As a rule, a person does this by voluntary exercise or involuntary shivering. Conversely, if the man has produced an unusual amount of heat by exercise he tries to disseminate it by seeking a cooler environment or by taking off some of his clothing. If this is not sufficient he breaks into a sweat, which cools the skin through vaporization. Dogs without sweat glands lose their excess heat by panting.

The mechanism of heat loss is of interest to the medical man, since it forms the basis of air conditioning. When a person is quiet in a moderately cool room most of the heat is lost through radiation from the warm surface of the body and warm clothing to the cooler walls and especially to the windows. The body gains heat through radiation from the heating apparatus and from lamps. Under ordinary conditions about 25 per cent of the calories are lost through the vaporization of water from the skin and lungs but with the outbreak of even small amounts of sweat this percentage rises. When the air and surrounding objects are warmer than the surface of the skin vaporization becomes the sole channel of heat loss. The percentage of calories lost by convection through the movement of air is extremely variable. In a quiet room a very quiet person may lose only 12 to 15 per cent of his heat in this manner, but the percentage rises roughly according to the square root of the velocity of the air movement. Even small motions of the body cause a considerable increase in the flapping effect of clothing.

The human body in a cold environment is able to conserve its calories by changing the skin and subcu-

taneous tissue into a suit of clothing. The peripheral blood flow is reduced almost to zero and the skin becomes as good an insulator as an equal thickness of leather or cork. When the body needs to lose heat the peripheral blood flow is increased and the warm blood from the interior of the body comes in contact with the skin, which is cooled by the vaporization of sweat. The most effective sweating leaves no visible water on the surface, sweat that drips is wasted since it removes no heat. In this loss of heat the hands and feet are relatively unimportant since they constitute only a small percentage of the total surface. Circulation in the hands is not necessarily a good indicator of the average circulation or of the total heat loss because the hands respond to emotion more than any other part of the body. The feet and especially the toes are not good indicators of the average condition of the skin because they are far from the source of heat and have large radiating surfaces. In cold weather the skin of the toes may show temperature readings below that of the dry bulb thermometer. The toes resemble wet bulb thermometers.

In one of the older hospitals in New York there was a women's ward on the north side of the building that was difficult to heat on a cold winter night. In making rounds after such a cold night it would be noted that most of the patients showed a subnormal temperature and that many of the older women had temperatures alarmingly depressed. Here was a combination of low heat production on the part of the old women and high loss through radiation and convection. Their feet were icy cold, and since many of them had impaired peripheral circulation the situation was serious. At the present time in Russia when the weather is so extremely cold, if a soldier who has been keeping up his heat production by marching or fighting is wounded and has to remain quiet the heat loss will exceed heat production to such an extent that there will be a decided fall in body temperature contributing to the rapid production of shock. The same thing, to a lesser extent can happen in our own climate when a man is injured outdoors. It can happen even in the accident ward of a hospital. Going to the other extreme, a man in shock might be surrounded by so many hot water bottles and blankets that in the effort to lose calories a large amount of blood needed internally is diverted to the skin and a large amount of water and salt lost through dripping sweat.

In health the normal temperature of the body is regulated delicately at about 36.9 C, a little lower in the early morning, higher in the late afternoon. Minor or even moderately large changes in heat production or heat loss are balanced, as shown in the diagram (fig. 1). In fever the temperature regulating center in the hypothalamus seems to be adjusted at a different level, sometimes fairly constant, usually fluctuating 2 to 3 degrees C during the day. When the temperature regulating center is suddenly set at 40 C, the body at the normal temperature of 37 C (98.6 F) finds itself 3 degrees too cool and therefore calls into play the mechanism of increased heat production, sometimes supplemented by the skin mechanism which diminishes heat loss. If the change in the temperature regulating center is sudden, as in malaria the body has to warm itself by means of shivering. In most fevers the change can be made more gradually. If the patient has attained a high temperature say 40 C, and the heat regulating center is suddenly adjusted to the normal of 37 C the

body finds itself 3 degrees too warm, calls into play the mechanism of heat loss and loses calories rapidly through sweating

In diseases of high metabolism, for example toxic diffuse goiter, the body is faced with the continuous problem of losing abnormally large amounts of heat. Therefore, the peripheral circulation is greatly increased and sweating may be necessary even in moderately cool

TABLE 1—Total Energy Requirement Every Twenty-Four Hours, Including Eight Hours of Labor, as Estimated by Becker and Hamalainen

| Men                           | Calories |       |
|-------------------------------|----------|-------|
| Tailor                        | 2,600    | 2,800 |
| Bookbinders                   | 3,000    |       |
| Shoemakers                    | 3,100    |       |
| Metal workers                 | 3,400    | 3,500 |
| Painters                      | 3,500    | 3,600 |
| Cabinet makers                | 3,500    | 3,600 |
| Stone masons                  | 4,700    | 5,200 |
| Wood sawers                   | 5,500    | 6,000 |
| Women                         |          |       |
| Seamstress (with hand needle) | 2,000    |       |
| Seamstress (with machine)     | 2,100    | 2,300 |
| Bookbinder                    | 2,100    | 2,300 |
| Household servants            | 2,500    | 3,200 |
| Washerwomen                   | 2,900    | 3,700 |

atmospheres. The patient cannot tolerate as much clothing or as many blankets as the normal person. At the other extreme, persons with low metabolism, as in myxedema or inanition or old age, are obliged to restrict the loss of heat by diminishing the peripheral blood flow. They need warm clothing, especially since they are unable to keep themselves warm by exercise. These illustrations emphasize the importance of balance of calories. The physician is responsible not only for putting them into the patient but also for seeing that they are conserved or eliminated in the proper manner. Heat loss is just as important as heat production.

There are certain diseases in which not only the basal metabolism but also the total metabolism is decidedly raised. Chief among these comes toxic diffuse goiter, with an increase in the basal metabolism which may be 75 per cent or more. In addition, the restlessness of the patient and the muscular inefficiency in performing tasks raise the total requirement far beyond the basal rate. Emotional storms constitute an added caloric burden. There is also an increased metabolic rate in many patients with lymphatic leukemia, pernicious anemia, some patients with acromegaly, some with heart disease, and nephritis, particularly if the patient is dyspneic. There is a rise in metabolism in fever, perhaps as much as 40 per cent in a patient with a temperature of 40 C (104 F). If the patient is restless or delirious or coughing, the total metabolism is affected more than the basal. Agitated mental patients may have a very high requirement.

The depression of the basal metabolism in so-called complete myxedema is usually around 35 to 40 per cent. A similar decrease may be found with extreme inanition. Elderly patients who lie quietly in bed have surprisingly low total metabolisms.

There may be considerable loss of ingested calories in the feces, as for example in pancreatic or hepatic disease with poor absorption of fat. Interference with bile important in the feeding of premature infants.<sup>4</sup> Of the flow or with the abdominal lymph channels may also affect fat absorption.<sup>4</sup> Excretion of fat may be extremely 120 calories per kilogram of body weight contained in

the daily diet, 10 to 30 per cent may be lost as fat in the feces. The loss is reduced by lowering the fat intake. Full term infants usually waste less than 10 per cent of the food calories by fat excretion. Roughage or indigestible carbohydrate residue increases the fecal excretion of nitrogen, presumably from endogenous secretions. Recent interest in whole wheat cereals has led to a confirmation of the loss of nitrogen but has shown no interference in the digestion of fat or carbohydrate.<sup>6</sup> These observations on men should be extended to children and patients who may be less able to tolerate roughage. In diabetes the caloric loss from glycosuria which may be considerable, should be subtracted from the available calories of the food. Fortunately, with insulin extremely great losses are now rare.

The caloric needs of children form a chapter in themselves and the criteria are different from those of adults. Extra food must be given to take care of growth, large proportions of calories are needed to meet the incessant activities of playing children and athletic young men. In general, the food allowance for a child over 12 years should be about the same as that of an average adult or more than 2,500 calories a day. An active boy at 15 or 16 years may use 4,000 calories a day.

Bearing all these factors in mind, it is usually possible to form a rough estimate of the calories produced by a normal person or a person with a given disease. Since the basal metabolism of different persons may vary 10 to 15 per cent from the average and since in the same person it may vary 5 to 15 per cent from day to day, it is obvious that one cannot make an accurate prediction. Moreover, the basal metabolism is only a small proportion of the total metabolism unless the person is confined to strict bed rest. Therefore, in estimating the total caloric requirement it is almost impossible to guess the basal metabolic requirement within 100 to 200 calories. Still, in figuring out a dietary it is a help to estimate the person's height and weight, find the average and figure out the basal metabolism without bothering to calculate closer than the nearest 100 calories. For a person quiet in bed one can add 10 per cent, a patient moderately active, 30 per cent, a patient

TABLE 2—Recommended Daily Allowances for Calories (F. and Nutrition Board, National Research Council)

|                            | Calories per Day |
|----------------------------|------------------|
| 70 kg man, fairly active   | 3,000            |
| very active                | 4,500            |
| sedentary                  | 2,500            |
| 55 kg woman, fairly active | 2,500            |
| very active                | 3,000            |
| sedentary                  | 2,100            |
| Children                   | 100/kg           |
| Under 1 year               | 1,200            |
| 1 - 3 years                | 1,600            |
| 4 - 6 years                | 2,000            |
| 7 - 9 years                | 2,500            |
| 10 - 12 years              | 2,600 girls      |
| 13 - 15 years              | 2,400 girls      |
| 16 - 20 years              | 3,000 girls      |

of bed in the sickroom during the day but must be quiet, 50 per cent. The day may be divided into periods of sleep, rest, moderate activity and the like, and one can estimate the calories consumed each hour and add the total of estimates. Fortunately, it is seldom necessary to come within 200 to 400 calories of the actual metabolism. One of the best checks, nature's, is the appetite, which in most normal persons varies with surprising accuracy. This, however, varies in disease and is notoriously faulty in

4 Verzar, F., and McDougall, E. J. Absorption from the Intestine, New York Longmans, Green & Co., 1936.

6 Scallock R. R., Basinski D. H. and Murlin J. F. J 22 589 (Dec) 1941

Fairly accurate measurements are made in metabolism wards in which some patients are in bed and others are carrying on a moderate amount of activity. All the food eaten by each patient is carefully weighed and the excreta are collected and analyzed. Changes in body weight are charted daily and the food intake is adjusted to maintain an approximately uniform body weight. In laboratories equipped with a large respiration chamber or calorimeter in which a man may remain for several days measurements of total metabolism can be made within 5 per cent. This can be balanced against the food intake but the normal activity of the person is somewhat restricted. For the person who is outdoors working, the total requirement can be estimated from the tables of occupations given in the textbooks of physiology and dietetics, for example, table 1.<sup>7</sup> The Food and Nutrition Board of the National Research Council<sup>8</sup> recently has recommended the general standards of caloric requirement for children and adults under average conditions given in table 2. A good deal depends on temperament and habit since there may be two clerks in the same office, one slow moving and placid and the other quick and nervous who will have quite different requirements. One man takes the elevator or walks up stairs slowly, the other runs up stairs. Walking at a rate of 5 miles an hour requires about 50 per cent more energy than walking at 3 miles an hour.

The calculation of the calories produced is only the first step in estimating the calories of the diet. The physician may wish to give more calories than the "requirement" to a person who is thin or who is convalescent from an acute disease. On the other hand, he may wish to give an amount of food below the total expenditure in order to reduce weight or to diminish the metabolism or the total work of the circulation. Again he may desire to give an amount equal to the expenditure but may be limited by the lack of appetite or the condition of the gastrointestinal tract. In a hospital ward there are relatively few patients whose heat production is even approximately equal to the number of calories they take in the food. Those acutely ill are living partly off the restricted diet and partly off their own body supply of fat and protein. Those who are convalescent are storing much of their food intake as body protein or body fat. In patients who are seriously ill the changes in weight are only partially due to changes in body protein and fat, since most of the fluctuations are caused by gain or loss in body water. Newburgh and Johnston<sup>9</sup> have shown that this often occurs in the obese and that the patient, for a week or more, may lose large amounts of body tissue before there is a drop in weight. In the long run, provided there is no edema, the body weight is the best indication of the adequacy of a diet. The scale should be used regularly with the ambulatory patient, and frequent weighings are extremely valuable in those who are confined to bed (fig 2).

Can a general basic diet be recommended which will fit the needs of the average patient in the hospital? Other requirements besides the caloric intake need to be considered. When the physician is confronted with a patient who cannot take a sufficient number of calories even with expert cooking and skilful nursing, he has the responsibility of seeing that the food administered

contains the essential vitamins and minerals. If necessary, they can be supplemented by additional vitamins in concentrated form. In some hospitals this problem is met by recommending a general diet of 2,000 calories, containing 75 Gm of protein, 100 Gm of fat and 200 Gm of carbohydrate. This general diet of 2,000 calories seems to be an adequate standard for the average hospital patient, although its interpretation for each individual must be a liberal one. A supply of vitamins and minerals adequate for a normal person is provided by including in the diet the following "protective" foods: 1 pint of milk, 1 egg, 1 serving (3 to 4 ounces) of meat, 3 teaspoons (15 Gm) of butter, 4 servings of whole grain bread or cereal, 2 vegetables other than potato 1 of which is raw and 2 fruits 1 of which is raw. The "protective" foods thus supply about 1,200 of the 2,000 calories.

An appetizing menu may lead to a wide variation in the daily caloric intake. In one hospital<sup>10</sup> a week's survey of the general diets as served showed a daily

Fig 2—Weight loss curve. An obese subject first maintains her weight and then loses weight so rapidly that the total loss corresponds with the prediction (Newburgh and Johnston<sup>9</sup>).

variation between 1,900 and 3,200 calories with an average of 2,570 calories. But the food served does not necessarily represent the food intake of the patients. When the patients in semiprivate rooms selected food from a menu of approximately 3,000 calories, about 25 per cent of the bread, butter and vegetables and 37 per cent of the salads were not eaten. The ward patients on a nonselective diet of 3,000 calories left between 5 and 10 per cent of the food served. When special diets are needed it is essential to know the food intake as well as the food prescription.

To meet special needs additional calories can be added to the general diet, such as an extra pint of milk during the latter part of the period of pregnancy. The extra energy required for lactation depends on the amount of milk produced. The extra food calories should be about twice those secreted in the milk or approximately 700 to 1,500 calories of food for 500 to 1,000 cc of milk. Dairy products are the preferred foods for supplying the extra calories. Excess caloric intake leading to fat deposition in the mother during

the latter period of pregnancy influences lactation rather than the weight of the child at birth<sup>11</sup>

The energy requirements of the body under various conditions are calculated from the basal metabolism plus activity, as previously noted, according to the oxygen consumption and the physiologic combustion values of protein, fat and carbohydrate derived from Rubner's work. Since the foodstuffs vary in composition and degree of assimilation, the slightly lower values of Atwater are generally used for the calculation of diets in this country. Atwater's figures are 4 calories per gram for protein and carbohydrate and 8.9 calories for fat, although 9 for fat is frequently used. A recent review<sup>12</sup> has emphasized the lack of uniformity in specifying diet standards. For example, 100 Gm of protein, 80 of fat and 500 of carbohydrate would represent 3,423 calories as purchased (allowing 10 per cent for kitchen and table waste) or 3,204 Rubner calories, or 3,112 Atwater net calories. The difference becomes significant when the results of laboratory experiments are translated to large groups of persons.

To simplify the calculation of diets, it has been a common practice to divide the vegetables and fruits into general classes according to their total carbohydrate content. Recent analyses by improved methods indicate that a reclassification of some of the foods is in order. The later figures for available carbohydrate tend to be lower than those in the generally accepted tables.<sup>13</sup> Another possible error has appeared in the sample to sample variation of cooked vegetables. The discrepancy between the calculated carbohydrate calories and those determined by direct analyses was particularly large in boiled squash, parsnips and sweet potatoes.<sup>14</sup>

What is the optimum proportion of fat to carbohydrate in the diet from the standpoint of meeting the caloric needs of the body under various conditions? Exact data on this point are scarce. Economic factors dictate the diets of large parts of the population and thus lead to a relatively high percentage of the cheaper carbohydrates. This situation influenced the older standards such as Voit's, which called for 60 to 70 per cent of the calories in the form of carbohydrate. The recent emphasis on vitamin and mineral requirements and on the biologic value of proteins tends to increase the fats and decrease the carbohydrates. This is seen especially in the quoted 2,000 calorie general diet for patients. Fat provides 45 per cent and carbohydrate 40 per cent of the calories, which together with 15 per cent from protein yield a respiratory quotient of 0.83. It is perhaps significant that a similar proportion of fat to carbohydrate (1:2 by weight) is found in human milk. When a free choice of food is possible, men doing heavy sustained work and athletes in training with high caloric intakes of 4,500 to 7,500 calories select a diet containing 15 per cent or more of the calories in protein and the balance about evenly distributed between fat and carbohydrate.<sup>15</sup> Many of the observed respiratory quotients approach the median level of 0.85 in continued heavy exercise. If future research supports the present indication, a more abundant consumption of fat would be desirable for optimum nutrition.<sup>16</sup>

TYPHOID IN THE LARGE CITIES OF THE UNITED STATES IN 1941

THIRTIETH ANNUAL REPORT

In keeping with the practice of previous years, a communication was addressed to the health officer of each of the cities, requesting the number of deaths from typhoid both among residents and among nonresidents which were recorded in 1941. There seems to be a decreasing tendency for many cities to keep readily available the reallocations for residence and for nonresidents such data are obtainable only through the state health departments. While each health officer was asked to record an estimate of population for 1941, it is apparent that the great majority of these public health administrators are continuing to use the 1930 census figures. As no official figures are available for any date subsequent to that of the federal census, it has been deemed advisable to employ the population determined by this uniform tabulation. In areas of concentration of military and defense activities, the practice may cause a slight error, but it is believed that no great injustice has resulted. As in the preceding review, the provisional census data for 1941 are used, since the Bureau of the Census has not made population estimates for cities as of July 1, 1940.

Paratyphoid has again been excluded. In tables 1 to 8 inclusive (as well as in table 10) a special table has been made of cities in which all deaths occurred among nonresidents. It seems appropriate at the

\* All typhoid deaths were stated to be in nonresidents.  
† One third or more of the reported typhoid deaths were stated to be in nonresidents.

beginning of this review to state that, in addition to the thirty-seven cities enumerated on the honor roll in table 10, nineteen additional cities are qualified for such acclaim but have been charged with typhoid deaths among nonresidents who have been hospitalized or otherwise cared for in these cities (Atlanta, Columbia, Dayton, Denver, Fort Worth, Indianapolis, Kansas City, Kan., Knoxville, Memphis, Nashville, New Orleans, Paterson, Providence, Sacramento, St. Louis, City, Syracuse, Tampa, Toledo, Youngstown). A special symbol has been used to indicate those cities in which more than one third of the reported deaths were stated to have been among nonresidents.

The preceding articles in this series were published in the following issues of the *Journal of the American Medical Association*:  
May 31, 1913, p. 1702; May 9, 1914, p. 1473; May 1, 1915, p. 1305; March 17, 1917, p. 84; May 1, 1918, p. 777; April 5, 1919, p. 997; March 6, 1920, p. 67; May 1, 1921, p. 860; March 25, 1922, p. 890; March 10, 1923, p. 67; May 1, 1924, p. 860; March 14, 1925, p. 813; March 27, 1926, p. 1674; May 1, 1927, p. 1574; May 9, 1931, p. 1576; April 30, 1932, p. 1574; May 19, 1934, p. 1677; June 8, 1935, p. 414; June 19, 1937, p. 2118; July 30, 1938, p. 2118; May 25, 1940, p. 2103; and Jan. 17, 1941, p. 1.

Special attention is called to the twenty-five cities listed in table 9 which reported no typhoid death during the past two or more years. Fort Wayne now heads the list with no death in seven years. This represents the longest consecutive period of years for which a city included in the review has been free of

# Incomplete data.

a typhoid death both among residents and nonresidents. South Bend reports no death in six years, Fall River, Lynn, New Bedford and Wichita none in five years. It is apparent that some cities are far more liberal than others in their attitude in accepting for hospitalization cases of communicable disease from the neighboring rural areas. In some instances legal circumstances compel the city to accept cases from the county.

Eight of the large New England cities (there were eleven in 1939, ten in 1940) report no death from typhoid in 1941 (table 1). Cambridge, Fall River, Hartford, Lowell, Lynn, New Bedford and Springfield have maintained their ranking of 1940 while Somerville has been added to the honor roll. Fall River, Lynn and New Bedford have extended their good records to five years, Cambridge and Lowell record no death in four years. Springfield reports no death among residents during the past eight years. Hartford none for four years. While in 1940 one half of the eighteen cities recording no deaths from typhoid during a two year period were to be found among the New England cities in 1941 only one third (eight among twenty-five) were from these states. Somerville, with two deaths among residents in 1940, now returns to the honor roll, there have occurred but three deaths in Somerville during the past eight years. Boston records one death among residents in 1941. Providence reports one death among nonresidents. It

is stated that the one death among residents in Worcester is the first in more than ten years. Waterbury records its first death among residents since 1938, New Haven the first since 1939. Bridgeport with no death in five years (1935 to 1939) reports one among residents in 1941 (there were three in 1940). The New England cities as a whole (population 2,579,152) lost first place among the grouped cities in 1940. They were excelled by the Middle Atlantic cities (now in third place), who in turn were replaced in 1941 by the East North Central cities (table 13) which occupied this enviable position in 1938. In the New England cities there were recorded six deaths, the same as for 1939 (there were nine in 1940). The rate (0.23), which is lower than that of 1940 (0.35), remains the same as recorded for 1939. It should be recalled that for the quinquennium 1936-1940 the New England cities held first place.

The Middle Atlantic cities (table 2) have a group rate (0.24) which is but slightly higher than that of the New England cities. It is lower than the rates for 1940 (0.27) and 1939 (0.37). Eight cities (there were nine in 1940) report no typhoid death in 1941 (Albany, Buffalo, Erie, Jersey City, Newark, Scranton, Trenton, Yonkers). Buffalo reports but one death (in 1939) among residents during the past five years, Scranton but two deaths for eight years, Yonkers but one death during five years. It is stated that in Erie there has occurred only one death among residents

| Nashville   | 1.2  | 3.6  | 3.4       | 5.7       | 18.2      | 17.8      | 20.7      | 40.2      | 61.2      |

\* All typhoid deaths were stated to be in nonresidents.

† One third or more of the reported typhoid deaths were stated to be in nonresidents.

# Incomplete data.

during the past seven years. Albany and Trenton report no death among residents for three years. Utica, with the excellent record of no death among residents for ten years, reports the death in 1941 of a railroad engineer. Unable definitely to ascertain any outside source of infection, the health officer feels compelled to accept this charge against his mortality record.

Syracuse reports one death among nonresidents, none among residents for six years. The one death in Paterson was stated to be in nonresidents. New York reports fourteen deaths (one among nonresidents). This city reported eleven deaths in 1940, seventeen in 1939, twenty-two in 1938. Philadelphia reports seven

\* All typhoid deaths were stated to be in nonresidents.  
† One third or more of the reported typhoid deaths were stated to be in nonresidents.  
‡ Incomplete data.

deaths (twelve in 1940), two among nonresidents, Pittsburgh three (the same as in 1940), all among residents. It is stated that there was one death among residents of Reading in 1941, the health department having no data on nonresidents. In the group as a whole (population 13,129,185) there were thirty-one deaths in 1941 compared with thirty-six in 1940 and forty-eight in 1939. There were two geographic areas which had a lower death rate in 1941, the East North Central and the New England.

The rate (table 3) for the South Atlantic cities (0.88) is higher than the rate of 1940 (0.73) but lower than that of 1939 (0.93) and the quinquennial period 1936-1940 (1.14). In these cities (population 2,727,985) there occurred twenty-four deaths in 1941, twenty in 1940 and twenty-five in 1939. There was but one city (Wilmington) without a death in 1941. There were four such cities in 1940. Wilmington reports no death during the past three years. Two cities (Atlanta, Tampa) record all deaths in 1941 among nonresidents, two in Atlanta, one in Tampa. Eleven (nearly one half) of the deaths in the group of cities as a whole occurred among nonresidents. In three cities (Baltimore, Washington, Richmond) more than one half were among nonresidents—three of six in Baltimore, three of five in Washington, one of two in Richmond. Charlotte (one death in 1941) has been included in the group for the second time, however, for purposes of adequate comparison, the figures for this city have been omitted in calculating rates for the group as a whole. Jacksonville reports four deaths, one among nonresidents.

The East North Central cities (population 9,386,378) have returned to first place, which rank they held

temporarily in 1938. Gary (no death in 1941) was added to this group in 1940, but figures for this city have been omitted in determining rates for the group as a whole. The number of typhoid deaths decreased from thirty-three to nineteen (the rate from 0.35 to 0.20). This is the lowest rate thus far reached by any group of cities. That the decrease in number of deaths has been scattered among the cities is indicated by the fact that there are only six cities exclusive of Gary (seven in 1940) which report no death in 1941 (Akron, Canton, Evansville, Fort Wayne, Grand Rapids, South Bend). Five cities (Columbus, Dayton, Indianapolis, Toledo, Youngstown) record all deaths among nonresidents. But two cities report more than two deaths each (four in Detroit, one among nonresidents, three in Chicago, all residents). Fort Wayne reports no typhoid death in seven years, South Bend no death in six years. It is stated that there have occurred but two deaths among residents of Grand Rapids for more than eleven years. No death among residents of Canton is recorded during the past five years. Cleveland records two deaths, one among nonresidents. Cincinnati, Flint and Peoria report one death each among residents. Following a period of four years (1937-1940) without a typhoid death, Milwaukee records one death among residents.

The six cities (table 5) in the East South Central group (population 1,286,747) show a very significant decrease in the death rate (0.70 in 1941, 2.09 in 1940).

†† No typhoid deaths in three years.

2.58 in 1939). The new rate is far below the quinquennial period 1936-1940 (2.54). The number of deaths in these six cities decreased from twenty-seven in 1940 to nine in 1941. Of these five were among nonresidents, leaving but one resident (one each in Birmingham and Cleveland).

two in Louisville) Not one city records the absence of a death, but it is stated that in three (Knoxville, Memphis, Nashville) all deaths were among nonresidents. It has repeatedly been stated that the rates in this area have been adversely affected by the hospitalization of cases brought in from the surrounding rural areas. The great improvement shown in 1941 may reflect a betterment of health conditions in areas neighboring the urban centers or a change in hospitalization policy. Especially noteworthy is the decrease in Memphis from fifty-eight deaths (twenty-seven among residents) during the five year period 1936-1940 (an average of nearly twelve cases a year) to one death (thus in a nonresident) in 1941.

The West North Central group (table 6) (population 2,716,484) shows a decrease in the death rate (0.41 in 1940, 0.29 in 1941). This group now occupies

<sup>1</sup> One third or more of the reported typhoid deaths were stated to be in nonresidents.  
<sup>2</sup> Thirty six without Gary.  
 Fifty three without Charlotte and Sacramento.

fourth place. The number of deaths from typhoid have decreased from eleven in 1940 to eight in 1941. Five cities (Des Moines, Duluth, Omaha, St. Paul, Wichita) record no deaths and Kansas City, Mo., reports two deaths among nonresidents. Wichita records no death during the past five years. Duluth and St. Paul none for three years, Des Moines none for two years. It is stated that there has occurred but one death in Duluth during the past six years, two in St. Paul for five years. For 1941 Kansas City, Mo., and Minneapolis record one death each among residents, St. Louis four deaths two among nonresidents.

The eight cities of the West South Central group (table 7) (population 2,048,692) report a decided reduction in the death rate (2.00 in 1940, 1.37 in 1941). The actual number of deaths decreased from forty-one to twenty-eight. There was but one city (Tulsa) in 1940 without a death. In 1941 there were three cities

(Oklahoma City, San Antonio, Tulsa) without a death. In this group of cities, 60 per cent of deaths (seventeen out of twenty-eight) were recorded as among nonresidents. Of eleven deaths in New Orleans, all were among nonresidents. There was one death among non-

\* The following fifteen cities are omitted from this table because data for the full period are not available: Canton, Chattanooga, Dallas, Fort Wayne, Jacksonville, Knoxville, Long Beach, Miami, Omaha, Oklahoma City, South Bend, Tampa, Tulsa, Utica, Wichita, Wilmington.

† Data for Fort Worth lacking.  
 ‡ 1940 census figures used.

El Paso reports four deaths, two among residents (three in 1940, two among residents). Houston records five deaths among residents (six in 1940).

The cities in the Mountain and Pacific states (table 8) (population 4,186,039) report an increase from thirteen

deaths in 1940 to sixteen in 1941. The rate has increased from 0.30 to 0.38. Sacramento has again been omitted in calculating the total number of deaths and the rates. This city, which reported no death in 1940, now records one death for 1941 among nonresidents. There are five cities (Long Beach, Oakland, Portland, Seattle, Spokane) without a death. Two cities in addition to Sacramento (Denver, Salt Lake City) record one death each among nonresidents. Los Angeles reports ten deaths, four among residents (six in 1940, three among residents). San Francisco reports two deaths, one among residents (the same for 1940). San Diego and Tacoma record one death each among residents.

THE HONOR ROLL

The number of cities with no death from typhoid has decreased from thirty-nine to thirty-six. There has occurred, however, a very significant increase in the number of cities with a death rate below 1.0 (from thirty in 1940 to forty-six in 1941). Of particular significance is the decrease in the number of cities with rates in excess of 1.0 (twenty-four in 1940, eleven in 1941). There are but four cities with rates above 2.0, and one of these (New Orleans) reports all deaths among nonresidents. Twenty-five cities record no typhoid death in 1940 and 1941 (table 9). As repeatedly stated, several other cities in the first rank would appear in the honor roll were they not charged with deaths among nonresidents.

For the seventy-eight cities (table 12) for which data are available since 1910 there occurred one hundred and twenty-three deaths from typhoid in 1941, which is the lowest of record (172 in 1940, 232 in 1939). The rate is now at a rate of about 0.33 per hundred thousand of population. For the ninety-three cities

\* 1940 census figures used  
† Data for South Bend for 1925-1929 are not available  
‡ Lacks data for Oklahoma City in 1926

the number of deaths in 1941 is one hundred and forty-one (190 in 1940). The rate has decreased from 0.50 to 0.37. Of the one hundred and forty-one deaths in the ninety-three cities, sixty deaths (43 per cent) were among nonresidents. The health officers report no special outbreaks of typhoid. Preventive services have apparently been carried on as in previous years. Lay consideration for the dangers of exposure to insanitation, especially when traveling, have doubtless had a salutary influence on the prevalence of typhoid. The New England, Middle Atlantic, East North Central and West North Central groups have maintained their excellent rates of many years' standing. Especially noteworthy are the significant decreases in the rates of the cities in the East South Central and West South Central groups.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

THE COUNCIL VOTED AT ITS LAST ANNUAL MEETING TO INITIATE ACTION TOWARD PREPARATION AND PUBLICATION OF A REPORT ON THE PATHOGENESIS AND TREATMENT OF HYPERTENSION IN THE LIGHT OF PRESENT DAY KNOWLEDGE. CORRESPONDENCE WITH DR. HARRY GOLDBLATT REVEALED HIS WILLINGNESS TO UNDERTAKE THIS PROJECT. ACCORDINGLY THE FOLLOWING ARTICLE WAS SUBMITTED BY DR. HARRY GOLDBLATT, DR. JOSEPH R. KAHN AND DR. HARVEY A. LEWIS AND HAS BEEN AUTHORIZED FOR PUBLICATION BY THE COUNCIL.

AUSTIN E. SMITH, M.D., Acting Secretary

STUDIES ON EXPERIMENTAL HYPERTENSION

XVII. EXPERIMENTAL OBSERVATIONS ON THE TREATMENT OF HYPERTENSION

HARRY GOLDBLATT, M.D.  
JOSEPH R. KAHN, M.D.  
AND  
HARVEY A. LEWIS, M.D.  
CLEVELAND

Experimental hypertension of a persistent type is regularly produced by the application of a specially designed adjustable silver clamp so as to constrict the renal arteries or by constriction of one renal artery and excision of the opposite kidney. This leads to elevated blood pressure without or with only little depression of the excretory function of the kidney. The comparison of human essential hypertension is, in its early stages, at least, also without accompanying decrease of the excretory function, but as it progresses renal insufficiency may develop. The kidneys of such patients show arteriolar sclerosis of varying degrees of intensity and distribution. In some instances renal arterioleclerosis or other chronic disease of the kidney may be a determining factor. In experimental hypertension produced by this method and in human essential hypertension a common feature is alteration of renal circulation.

The following report is an evaluation of various methods of treatment, both surgical and medical, tested on animals with experimental hypertension. Although the mechanism of the hypertension is of circulatory origin in both experimental and human essential forms, there is one striking difference. The experimental form is due to reduction of the lumen of the main renal arteries. This is occasionally true in man because of arteriosclerosis at the ostia of the main arteries within the main renal arteries, but in the large majority of cases essential hypertension is associated with disease of smaller arteries, within the kidney, and it is especially manifest in the preglomerular arteries.

SURGICAL TREATMENT

(a) Operations on the Nervous System.—It has been shown that the various surgical operations on the nervous system that have been devised for the treatment of human hypertension neither prevent nor cure it.

From the Institute of Pathology, Western Reserve University, Cleveland, Ohio. The investigations by the authors were supported by the Trust (L. D. Beaumont) and aided by grants from the Foundation of the John and Mary R. Markle Foundation and from donors and a special grant to Dr. Lewis from the National Institute for Medical Research.

mental renal hypertension produced in animals as described. Renal denervation, supradiaphragmatic section of splanchnic nerves and excision of the lower four thoracic sympathetic ganglions, subdiaphragmatic section of splanchnic nerves with excision of the lumbar ganglions, section of the anterior nerve roots from the sixth dorsal to the second lumbar inclusive, total sympathectomy of the abdomen and thorax, including denervation of the heart and even destruction of the spinal cord have no permanent effect in the prevention or alleviation of this type of hypertension.<sup>2</sup>

In the dog the effect on the vasomotor apparatus, especially in the splanchnic region, is presumably the same as in man. There is, however, one significant difference between the anatomic causes of hypertension in dog and man. In animals the restriction of blood flow to the kidneys is effected by constriction of the main renal artery by means of a metal clamp. This is rigid and is not altered by any of the operations on the nervous system as long as the clamp remains on the vessel. In man, on the contrary, the counterpart of the effect of the silver clamp is produced by the thickening of the wall and consequent stenosis of the lumen of many small arteries and arterioles within the kidney.

It is conceivable, at least that some of these vessels which contribute to the disturbance of renal circulation are merely in a state of spasm and still under the influence of the nervous system, so that they are, therefore, in a reversible state and become dilated as a result of the elimination of any vasoconstrictor stimuli. The conclusion that follows from these experiments is that whatever improvement does occur from these operations is in all probability, apart from the effect of enforced rest due to improvement of the circulation to the kidney and not to an effect on the rest of the vasomotor apparatus of the abdomen.

(b) *Excision of a Single Diseased Kidney*—In the earliest experiments on the production of renal hypertension in the dog it was found that constriction of the main artery of only one kidney might result in elevation of the blood pressure which persisted from weeks to months.<sup>3</sup> It has since been shown that in the rat, sheep and goat<sup>4</sup> hypertension due to constriction of only one main renal artery may persist for many months. Furthermore, the removal of the clamp on the renal artery, or the excision of the corresponding kidney, at a time when the blood pressure was still considerably elevated, resulted in a prompt (twenty-four

to forty-eight hours) return of the blood pressure to normal, provided the opposite kidney was normal. These observations have been fully confirmed<sup>5</sup> and have led to the recognition of human hypertension associated with unilateral renal disease, especially unilateral chronic pyelonephritis or any other pathologic condition capable of producing a disturbance of renal hemodynamics similar to that produced by constriction of the main renal artery. It is now known that in man some types of unilateral renal disease may produce hypertension that persists for a long period and that the hypertension may also be cured by the removal of the diseased kidney, provided the contralateral kidney is normal.

Recently Abeshouse<sup>6</sup> published an extensive review of this phase of the subject which summarizes most of the experimental work and gives the reports of human hypertension treated by unilateral nephrectomy. Although alleviation or seeming cure of the hypertension has already been reported in a goodly number of cases, yet the number in which improvement has not occurred is also considerable. This may mean merely that in such cases, although the results of the tests of renal excretory function of the contralateral kidney were within the limits of normal, the kidney was not normal. It was probably the seat of vascular disease of a degree which present methods do not detect but which may have been responsible for the persistence of the hypertension.

(c) *Surgical Production of Collateral Renal Circulation*—In animals with persistent hypertension due to constriction of both main renal arteries, the natural development or surgical production of collateral circulation to these kidneys has also resulted in the return of the blood pressure to normal,<sup>7</sup> but with one exception<sup>8</sup> the few reported attempts to do this in human hypertension have not yet been successful.<sup>9</sup> However, in human hypertension, up to the present time, the attempt to produce collateral circulation has been practiced on only one kidney in cases in which both kidneys were presumably diseased. The difference in results is probably due to the fact that the operation was on one side only but is undoubtedly also due to the fact that in the dog the vessels inside the kidney are not organically diseased, while in man, in most instances, the vascular disease is intrarenal and often only the preglomerular arterioles are affected. Anastomosis of extrarenal and intrarenal vessels could, therefore, prove of little or no value unless only the larger intrarenal arteries, or better the extrarenal portion of the renal

artery, were diseased. The occurrence of such cases in man has already been reported,<sup>10</sup> but the identification of this particular condition in life is difficult or impossible.

We have also observed patients with hypertension who at autopsy showed little or no intrarenal vascular disease, but the mouth of each renal artery was stenotic owing to an arteriosclerotic plaque in the wall of the aorta around it, or to arteriosclerosis of both main renal arteries or even to partial thrombosis of the main renal arteries, conditions that could produce the same intrarenal hemodynamic disturbances as are caused by experimental constriction of the main renal arteries. If such conditions could be recognized in life, treatment by production of accessory renal circulation might be successful.

#### MEDICAL TREATMENT

In a recent publication, Mosenthal<sup>11</sup> summarized the effects of the most common methods of medical treatment of human hypertension and concluded that "there are no means by which an elevated blood pressure can be appreciably and persistently lowered." He referred, of course, to cases of so-called essential hypertension. The same conclusion had been reached previously by others. During the past six years many of the methods of medicinal treatment mentioned in Mosenthal's article, and other methods also, have been tested in this laboratory and elsewhere<sup>12</sup> on dogs with the type of experimental renal hypertension which resembles that human form of hypertension which is associated with renal vascular disease. The results are now summarized and evaluated in reference to the treatment of human hypertension.

An interesting difference between experimental hypertension due to renal ischemia in the dog and some of the types of hypertension that have been included under the heading of essential hypertension in man is the immediate response of the blood pressure of the latter to the effect of certain hypnotics, narcotics and anesthetics. For example, in many cases of human hypertension, the intravenous administration of pentothal sodium is said<sup>13</sup> to cause a significant, and sometimes a profound, fall of blood pressure. As a matter of fact, human hypertension which responds in this way to the injection of this drug is the type usually chosen for treatment by surgical operation on the nervous system.<sup>13</sup>

(a) *Pentothal Sodium*—In the tests on dogs with experimental renal hypertension the dose of pentothal sodium used was, as in man, between 10 and 15 mg per kilogram of body weight, injected intravenously, in

10 cc of saline solution during a period of about ten minutes. The blood pressure was taken immediately before the injection and again at the end of the injection, or soon afterward, when the dog had become completely unconscious. In our experience, in the trained normal dog a significantly persistent elevation of blood pressure is rare. In excitable dogs, normal or hypertensive, the blood pressure fell moderately during the period of unconsciousness, indicating that in the normal dog the pressures were relatively high for the animal and that in the hypertensive dog the hypertension which followed the constriction of the renal arteries was not entirely of renal origin and was probably, in part at least, psychogenic. In most of the normal and hypertensive, quiet, well trained animals, no effect on the blood pressure was observed from the injection of the dose of pentothal sodium indicated.

(b) *Pentobarbital Sodium*—Like pentothal sodium an anesthetic dose of pentobarbital sodium lowered the blood pressure of only normal and excitable untrained hypertensive dogs. Hamilton and his associates<sup>14</sup> found that the blood pressures of 5 dogs with "spontaneous hypertension" fell from an average of 222/161 to 137/67 after barbiturate anesthesia of surgical depth. In our experience persistent, spontaneous hypertension in the dog is very rare. We believe, therefore, that the dogs just mentioned were not truly hypertensive and that the hypertension which follows renal ischemia is unaffected by barbiturate narcosis or chloralose.

It is for this reason that before any type of medicinal treatment was tested each test animal was usually subjected, at least once, to an intravenous injection of pentothal sodium or chloralose. If the blood pressure did not fall significantly during the unconscious state, the dog was regarded as satisfactory for determination of the effect of various agents on the hypertension. A significant fall of blood pressure, on the contrary, was regarded as an indication that the elevation of the blood pressure was due, in part at least, to factors other than renal and the animal was not used for therapeutic tests.

(c) *Chloralose* (orthochloralose)—This drug, like pentothal sodium. In dogs with experimental hypertension due to renal ischemia a dose of 0.08 Gm of chloralose per kilogram of body weight, injected intravenously, dissolved in isotonic solution of sodium chloride (from 50 to 100 cc) had no appreciable effect on experimental renal hypertension in the dog. The rise of blood pressure was due, in part at least, to excitement.

(d) *Morphine*—As much as 0.1 Gm of morphine sulfate injected hypodermically in well trained hypertensive dogs weighing 15 to 20 Kg had no significant effect on the blood pressure. In the occasional excitable, untrained normal dog the blood pressure was somewhat decreased by this drug.

(e) *Nitrites*—Of the various substances that have a fleeting effect on human hypertension, the most effective is nitroglycerin, which produces a fall in blood pressure by producing peripheral vasodilation. In the dog, the nitrites are the most commonly employed. In the dog, with experimental renal hypertension, the most effective is amyl nitrite (pearl) or the intravenous injection of glyceryl trinitrate (1/100 grain, or 0.6 mg).

blood pressure almost immediately. In some animals the direct femoral mean blood pressure fell precipitously from a level well over 200 mm of mercury to 100 mm or less. The effect as in man, lasted only a few minutes, with a quick return to the original high level. The administration of these substances at frequent intervals prolonged the effect by causing repeated falls of the blood pressure but cessation of administration resulted in a prompt return of the blood pressure to the original high level.

(f) *Potassium Thiocyanate*—Of the drugs that have been suggested recently for continuous or frequent administration in cases of human hypertension, potassium thiocyanate is the best known. For man, it has been stated<sup>15</sup> that if an adequate concentration of this drug in the blood is maintained by daily administration the blood pressure may in some cases be kept at a considerably reduced level and may even fall to normal. In the dog with renal hypertension, it has been found that the concentration of the drug in the blood must be at, or very close to, the level of intoxication before an appreciable fall of blood pressure occurs. Intoxication, indicated usually by anorexia and vomiting and sometimes by diarrhea, regularly preceded the fall of blood pressure to a lower level. To obtain a concentration of 10 mg of this drug in 100 cc of blood the most effective concentration for man, the dog required a relatively larger dose than is necessary for man. Withdrawal of the drug resulted in a slow return of the blood pressure to the previously hypertensive level, the rate of return depended on the degree of intoxication of the animal. In 1 animal it took a little more than two weeks for return of the blood pressure to the original high level. During the greater part of this period the animal was obviously ill.

Davis and Barker<sup>12</sup> reported that injection of potassium thiocyanate effectively lowered the blood pressure of renal hypertensive dogs, and that supradiaphragmatic removal of the thoracic sympathetic trunks and splanchnic nerves rendered the animals even more sensitive to the drug.<sup>16</sup> Grollman, Harrison and Williams found<sup>12</sup> that potassium thiocyanate caused an insignificant fall when administered orally to hypertensive rats. Hamilton and his associates<sup>14</sup> found that sodium thiocyanate lowered the blood pressure of dogs with "spontaneous" hypertension but concluded that the season of the year (summer) was more likely the cause of the reduction in blood pressure than was the drug, as the fall persisted for two months after all the thiocyanate was excreted.

(g) *Mannitol Hexamtrate*—For the continuous treatment of human hypertension the nitrates have also been used. A preparation of mannitol hexamtrate, obtained on the open market and recommended for the treatment of human hypertension, was administered orally to 3 hypertensive dogs. No persistent reduction of blood pressure of these animals was observed from as much as 12 grains (0.8 Gm) daily for twenty-one days. This dose was about three times the maximum daily amount recommended for man. Occasionally, two to three hours after the drug was given a slight but significant reduction of the blood pressure was noted. However, it soon began to rise again and in the morning before the administration of the first dose of the drug, the blood pressure was almost invariably back to

the original high level. Grollman and his associates<sup>12</sup> obtained a similar result from the oral administration of similar compounds (sodium nitrite and erythrol tetranitrate) to hypertensive rats.

(h) *Viscum Album* (extract of mistletoe)—This has been used widely for the treatment of hypertension in man. In dogs with experimental renal hypertension the oral administration of 200 mg of this drug daily for two weeks had no significant effect on the blood pressure. There were no untoward effects from the administration of this amount of the drug although it was equal to the dose recommended for man.

(i) *Allium Sativum* (garlic extract)—This is a drug that is being exploited commercially in the treatment of human hypertension. Dogs with experimental renal hypertension were given three times daily 2 capsules of a commercial preparation, each containing 0.3 cc of extract. This was three times the dose recommended for human hypertension, and the administration was continued up to two weeks. The blood pressure showed no significant change from the original hypertensive level. There were no untoward effects. This finding is in agreement with that of others.<sup>17</sup>

(j) *Extract of Watermelon Seed*—This is another drug that has been exploited commercially in the treatment of human hypertension. The administration of as much as three times the dose of a commercial preparation recommended for man had no significant effect on the blood pressure of dogs with experimental renal hypertension. There were no obvious untoward effects from the oral administration of this drug.

(k) *Sodium Bromide*—The bromides, in various forms, are frequently administered to hypertensive persons, and a significant lowering of the blood pressure has been observed in some human beings as long as the drug is taken. The blood pressure does not usually reach the normal level. However, in the unexcitable well trained hypertensive dog, as much as 8 Gm of sodium bromide by mouth daily for ten days failed to have a significant effect on the blood pressure. This indicates that the effect observed in persons with hypertension is on the accessory, possibly psychogenic, factors and not on the basic cause of the hypertension.

(l) *Veratrum Viride*—Tincture of *Veratrum viride* (U S P XI), 1 to 2 cc daily by mouth, which is from four to eight times the maximum dose that has been recommended for man, had no significant effect on the blood pressure of hypertensive dogs when given daily for two weeks. No signs of intoxication were observed from the administration of this amount of the drug.

(m) *Acetyl Choline*—Choline derivatives of several kinds have been used in the treatment of human peripheral vascular disease, with or without hypertension. There is no agreement about beneficial effects on the hypertension. The daily administration of acetyl choline for as long as one hundred and forty-four days failed to cause a persistent lowering of the blood pressure in dogs with experimental renal hypertension. The daily dose was from 2 mg to 5 mg per kilogram of body weight. It was dissolved in 500 cc of isotonic solution of sodium chloride and was injected intravenously in a continuous period of about three hours. Immediately after the injection the direct femoral mean blood pressure was frequently from 30 to 50 mm of mercury lower than the initial value, but it returned quickly to the original hypertensive level and remained

17 Wakerlin and Gaines.<sup>12</sup> Grollman, Harrison and Williams.<sup>12</sup>

there until the next injection. At autopsy these animals did not exhibit coronary arteriosclerosis or any of the other changes in the cardiovascular system that have been attributed to treatment with acetyl choline in nonhypertensive dogs.<sup>18</sup> Normal dogs that were given the same treatment for almost a year also failed to show a permanent effect on the blood pressure or pathologic changes in the vascular system. Grollman and his associates<sup>12</sup> also failed to observe an effect on the blood pressure from the oral administration of acetyl beta-methyl choline to hypertensive rats.

(n) *Choline Chloride*—As much as 80 grains (5.2 Gm.) of choline chloride by mouth daily for three weeks also had no effect on the blood pressure of dogs with experimental renal hypertension. There were no signs of intoxication as a result of the administration of this large dose of the drug.

(o) *Sodium Chloride*—Almost complete elimination of sodium chloride from the diet did not effect a permanent lowering of the blood pressure of hypertensive dogs. In some of the dogs there was finally a slight fall of blood pressure during a period of almost complete starvation when the animals refused to eat the unappetizing diet. Conversely, the administration of an excess of sodium chloride in the diet of normal and hypertensive dogs did not elevate the blood pressure appreciably above the usual range.

(p) *Nicotinic Acid*—The oral administration of from 200 mg. to 2 Gm. of nicotinic acid daily for three weeks failed to have a significant effect on the blood pressure of normal or hypertensive dogs. No untoward effects were noticed even in the dogs that had received the largest dose.

(q) *Biotin* (vitamin H)—Injected subcutaneously, for ten days, 1,000 units of biotin daily had no significant effect on the blood pressure of hypertensive dogs. The solution of biotin was supplied to us by Dr. Paul Gyoigy.

#### THE EFFECT OF DIET ON EXPERIMENTAL RENAL HYPERTENSION

Verney and Vogt<sup>5</sup> first reported on the effect of diet on the blood pressure of dogs made hypertensive by induction of renal ischemia. They found that the addition of an excess of salt caused a definite rise of blood pressure in hypertensive dogs which did not occur in dogs with 80 per cent of their kidney tissue removed surgically, or in normal dogs. We noticed no increase of pressure when large quantities of salt (20 Gm. daily) were added to the diet of dogs with experimental renal hypertension, a finding similar to that of Philipsborn, Katz and Rodbard<sup>19</sup> in hypertensive dogs and of Grollman and his associates<sup>12</sup> in hypertensive rats.

Cash and Wood<sup>20</sup> found that both the systolic and the diastolic pressure of 1 dog with experimental hypertension rose when it was fed a meat diet only when this animal gained in weight. Pursuing this line of investigation, Cash and Wood found that addition of beef fat to the diets of normal and hypertensive dogs caused a reversible rise of systolic pressure in both groups during the period of obesity, the diastolic pressure remaining unaltered. Verney and Vogt<sup>5</sup> reported a moderate

rise of blood pressure in dogs with experimental hypertension when they were fed a meat diet or when urea was added to their diet. Philipsborn, Katz and Rodbard<sup>19</sup> found that a high protein diet had no effect on the blood pressure of renal hypertensive dogs in the absence of renal excretory insufficiency, and this is in keeping with our own experience. Extra deprivation of protein in hypertensive dogs fed a cracker meal diet had an effect in slightly lowering the blood pressure only when these animals refused to eat the food and were losing weight.

#### ORGANOTHERAPY

Many different types of extract and other preparations of various organs, especially liver, kidney and pancreas, have been prepared and administered experimentally in a variety of ways for the treatment of human essential hypertension. The results, for the most part, have been equivocal and the claims for the value of these preparations by some have not been substantiated by others.

*Pancreas*—A preparation of pancreatic extract, available on the open market and recommended for the treatment of hypertension in man, failed to have any effect on experimental renal hypertension in the dog, even when twelve times the recommended dose for man was given daily for three weeks. Another pancreatic extract combined with extract of mistletoe, supposed to be effective for human hypertension, also failed to affect experimental renal hypertension in the dog even when four times the daily dose recommended for human hypertension was administered orally for four weeks. No untoward effects were observed. This is in agreement with the experience of Wakerlin and Garret<sup>21</sup> in the treatment of 1 hypertensive dog.

*Liver*—Tests of the efficacy of commercially available liver extract for the treatment of hypertension have not yet been made on animals with experimental hypertension.

*Kidney*—Renal organotherapy is by no means a new procedure for the treatment of hypertension without obvious disturbance of renal excretory function. The thought that the kidney may be an organ of internal secretion dates back to Brown-Séquard, who in 1851 was assisted in this work by d'Arsonval.<sup>22</sup> It was regarded as uremia, associated with anuria, due to disease or to bilateral nephrectomy, as, in part at least, in the nature of a hormone deficiency, and were then to prepare an extract of kidney for the treatment of this condition. They did not determine the effect of treatment on blood pressure. Many other preparations on the existence of an internal secretion of the kidney have appeared since, and treatment of nephritic eclampsia with uremia, by renal organotherapy, has been the subject of many reports. Renal organotherapy for the treatment of hypertension with renal insufficiency was first practiced by Renaut in 1903. He used macerated kidneys and claimed that the administration of this material had a beneficial effect in both conditions.

Actually, the first organ to be extracted for the possible isolation of a substance that would

pressure was the kidney. Renal extracts specifically for the treatment of human hypertension, were first tried by Gomez in 1934.<sup>23</sup> In 17 of his 40 cases the hypertension was accompanied by renal excretory insufficiency and accumulation of nitrogenous products in the blood. He stated that there was a steady drop of blood pressure as a result of the treatment in 38 of his 40 cases and also a fall of blood urea in 16 out of the 17 cases in which there was elevated blood urea. During the past few years there have been other publications<sup>24</sup> dealing with the treatment of renal hypertension by renal opotherapy and with injections of renal extracts of various kinds.

Hitherto what prompted the trial of renal substance or extract has always been either pure empiricism or the idea of the substitution of a missing or deficient renal hormone, or the detoxification of poisonous substances present in the blood due to disease of the kidneys. The thought that such treatment might inhibit the hypertension by inhibiting the formation of or destroying or inactivating a pressor substance of renal origin or some substance in the blood plasma which interacts with a substance of renal origin to form a pressor substance is entirely new and is based on the current theory of a humoral mechanism of hypertension of renal origin. It is in order, therefore, at this time to give a brief summary of this theory, which justifies the most recent attempts at renal organotherapy for experimental and human hypertension.

#### THE HUMORAL MECHANISM OF EXPERIMENTAL RENAL HYPERTENSION

Briefly, the present view of the humoral mechanism in the pathogenesis of renal hypertension is that renin, an enzyme or enzyme-like substance from the kidney, enters the blood stream by way of the renal veins. Renin by itself is not vasoconstrictor<sup>24a</sup> but interacts with a substance in the blood plasma identified as a globulin and probably a pseudoglobulin, which has been called renin activator<sup>25</sup> or hypertension precursor<sup>26</sup> and which is also being referred to as hypertensinogen or prehypertensin. The combination or interaction of these two substances results in the formation of a vasoconstrictor and therefore vasopressor substance that has been termed angiotonin<sup>27</sup> or hypertensin<sup>28</sup>. Page and his collaborators have regarded renin as the substrate while Munoz and his associates<sup>29</sup> believe that the substrate is the pseudoglobulin in the plasma. The authors agree that renin activator and hypertensin precursor on the one hand and angiotonin and hypertensin on the other hand are respectively identical. The mode of formation of the actual pressor substance from renin is,

in both cases theoretical. However, it can be shown that this interaction does occur *in vitro*. Renin, dissolved in isotonic solution of three chlorides, when perfused through the hind end of a toad shows no vasoconstrictor properties. If, however, renin, which is not itself vasoconstrictor, is mixed with blood serum, also without vasoconstrictor properties, in the proportion of 1 part of renin to 20 parts of blood serum, and the two are allowed to stand at room temperature for as little as ten minutes the resultant mixture is intensely vasoconstrictor. Presumably therefore, renin by itself is not vasopressor but it is the interaction with something in the blood that brings about the formation of a vasoconstrictor and therefore a vasopressor substance. Both groups of investigators also hypothesize the existence of a substance called either inhibitor<sup>30</sup> or hypertensinase,<sup>29</sup> which can be extracted in considerable quantity from kidney and intestinal mucosa<sup>31</sup> and, in smaller quantity from muscle.<sup>32</sup> This substance is capable of inactivating the vasopressor substance *in vitro*. Exactly how it produces this effect is not yet known but it is presumably due to enzymatic destruction of the effective pressor substance. This is the basis for the present attempt to treat hypertension by means of renal extract. Obviously, *in vivo* the effect of an antipressor substance could be brought about in one or several ways. It could be due to the interference with the formation, inactivation or destruction of renin, renin activator or angiotonin, or to interference with the response of the blood vessels by an effect on the nervous or muscular portions of the vasomotor apparatus.

#### THE TREATMENT OF EXPERIMENTAL RENAL HYPERTENSION BY RENAL ORGANOOTHERAPY

To test the value of the claims that have been made for renal opotherapy in man, Dr. Paul Gyorgy suggested to us that dogs with experimental renal hypertension be fed kidney to supplement a possible deficient factor of renal origin. Three hypertensive dogs were therefore fed 500 Gm of raw beef kidney daily from Oct 15, 1936 to Jan 29, 1937. They ate the kidney readily, in addition to a variable amount of Ralston's Purina Dog Chow, their regular diet. During the period of opotherapy with raw beef kidney, lowering of the blood pressure was not noted in any of the 3 dogs. This finding is in keeping with that of Wakerlin and Gaines.<sup>12</sup>

With the thought that the amount of kidney eaten daily might have been inadequate for any effect on the blood pressure, a papain digest of kidney was then prepared which permitted the administration by stomach tube of the equivalent of 3 Kg of renal substance daily. The effect varied in different animals. In some there was a slight but significant fall of the blood pressure, which returned to normal a few days after the administration of the digest was discontinued. The extract was vile smelling and evidently distasteful to the animals,

for, although it was administered by stomach tube, most of the dogs habitually vomited the material soon after the administration and refused to eat even their ordinary food. The fall of blood pressure, therefore, may have been due only to this untoward effect on the general condition of the animal and not to a specific effect of the digest.

Grollman and his collaborators<sup>33</sup> have reported that kidney extract given by mouth can effect a lowering of the blood pressure of hypertensive dogs and rats. Their rats were made hypertensive by reduction of the amount of renal substance.<sup>34</sup> This claim has not yet been confirmed. Later Grollman and his collaborators<sup>35</sup> and Page and his collaborators<sup>36</sup> reported beneficial effects obtained from the injection of extracts of whole hog's kidney in hypertensive rats, dogs and man. Most of the dogs of Page and his collaborators were made hypertensive by wrapping the kidneys in cellophane or silk.<sup>37</sup> In the most recent publications they have given details about the preparation of their extracts, so that it has become possible to reproduce them and, by tests on hypertensive dogs, to make a direct comparison of the potency of their extracts with those which we have produced.

The tests of renal extracts recorded here were carried out on dogs with experimental hypertension due to constriction of both main renal arteries by means of a silver clamp<sup>13</sup> or similar constriction of the main artery of one kidney and removal of the other kidney. In some of the animals an organic membrane ("Natural-lamb Skin") was also placed around one or both kidneys to eliminate the possibility of development of accessory circulation.

Extracts of kidney of various kinds were prepared by various methods. Most of the early preparations proved ineffective in lowering the blood pressure, principally, perhaps, because excessive heat was used in their preparation. When it was realized that the active substance was probably destroyed by the heat, an observation which was confirmed by personal communications from Dr. Page and Dr. Harrison, preparations were made by various methods in which the temperature of the material was at no time permitted to rise higher than 60°C. The results were erratic. Preparations which were moderately effective in lowering the blood pressure of one hypertensive dog failed entirely in another. One batch proved active and another, prepared in exactly the same way, proved inactive. When the injection of an active extract was discontinued, it took from one day to a week or longer for the blood pressure to return to its original high level. Since none of the extracts gave consistent results, details of their preparation are omitted.<sup>38</sup>

38 Large quantities of these extracts were prepared for us, under our direction, by the S. M. A. Corporation, Chagrin Falls, Ohio.

Two separate preparations made in exact accordance with the details given by Page<sup>36</sup> failed to have a significant effect on the blood pressure of hypertensive dogs when as much as the equivalent of 150 Gm of kidney substance per kilogram of body weight was injected daily, subcutaneously or intramuscularly, for eight days. Two other preparations of Page's extract (1 cc representing 120 Gm of renal tissue) proved fatal to 3 hypertensive dogs, in 1 about twenty-four hours after a single injection of 1.5 cc per kilogram of body weight, in another animal in the same time after two daily injections and in the third after four daily injections. At autopsy in these dogs, acute edema of the lungs was the only anatomic alteration to which death could be attributed. Whether the blood pressure of the first 2 of these 3 animals fell before death cannot be stated because they died in less than twenty-four hours, before the blood pressure was taken again, but in the animal that received four injections the blood pressure remained practically at the original high level for three days. The animal was found dead on the morning of the fourth day.

Three separate preparations, made exactly as described by Grollman and his collaborators,<sup>35</sup> were also tested by us on dogs and rats with hypertension due to renal ischemia. One preparation, injected subcutaneously twice daily, each dose equivalent to 100 Gm of whole kidney, had a slight but significant effect in lowering the blood pressure of 1 dog. Another preparation made by the same method, in daily dose equivalent to 1,500 Gm of whole kidney substance, injected subcutaneously, caused a significant fall of blood pressure in 1 animal but had no effect whatever on the blood pressure of another animal. Both animals had been hypertensive for a long time and the level of blood pressure was high. In the dog that did respond the direct femoral blood pressure fell 80 mm of mercury within a period of six days. The animal did not appear ill. There were no untoward systemic effects but there was a considerable amount of tenderness, spontaneous swelling and induration without suppuration at the site of every injection and in a considerable area around it. This disappeared in a variable time. When the injections were discontinued. Within twenty to forty-eight hours after the discontinuance of the injections, the blood pressure began to rise but in some cases did not reach the original hypertensive level for a week or longer. On the contrary, three hypertensive rats rendered hypertensive by enclosure of the kidneys in gauze painted with collodion were injected daily with as much as 2 cc of the same extract, a relatively small dose compared with that of the dogs, but the blood pressure showed no reduction in a period of two weeks.

Jensen and his collaborators<sup>41</sup> prepared an extract by a combination of the methods of Grollman and Page and of Page. They reported a lowering of blood pressure in some hypertensive rats. This has not yet been confirmed.

More recently Rockwell<sup>42</sup> reported a fall of blood pressure in 5 patients with hypertension who received daily intramuscular injections of their own preparation of renal extract. This extract had not been tested for its effect on the blood pressure of animals with experimental renal hypertension. Through Dr Rockwell we were afforded the opportunity to test the effect of their dilute as well as their concentrated renal extract on 3 dogs with prolonged experimental renal hypertension. A dose of as much as 5 cc of even the concentrated extract injected intramuscularly daily for two weeks, failed to affect the blood pressure of any of the animals. There was no inflammation, edema or tenderness at the site of injection, and no elevation of the temperature of the animals occurred after the injection. Like the renal extracts of others, it contained a considerable quantity of renin but did not inactivate angiotonin (hypertensin) *in vitro*.

#### POSSIBLE NONSPECIFIC EFFECT OF RENAL EXTRACT

Recently it was observed that in a hypertensive dog in which the injection of a renal extract was followed by a fall of blood pressure, the temperature was considerably elevated during the period when the blood pressure was lowered. In this dog the local reaction to the injection was substantial but suppuration did not occur. When the injections were discontinued as the temperature gradually fell to normal the blood pressure rose to the original hypertensive level. This observation suggested the obvious experiment of testing the effect on the blood pressure of any agent which would raise the temperature of a hypertensive dog.

Four dogs with experimental renal hypertension that had existed for from one to four years were given intravenous, intramuscular or subcutaneous injections of typhoid vaccine. It was soon found that to cause a significant rise of temperature in a dog a relatively large dose of vaccine is necessary, as compared with the dose required for man. The first dose consisted of 1 cc containing 1,000 million bacteria, intravenously, and this was repeated in some animals at intervals of one to three hours during the day. Even after a single injection a fall in blood pressure occurred which was not accompanied by any other obvious abnormality except the elevation of temperature. A similar observation had already been made on 1 dog by Levy and Blalock.<sup>43</sup> They also reported<sup>43</sup> a slight temporary decline of blood pressure in 3 hypertensive dogs whose temperature was raised by exposure to an atmosphere with an elevated temperature. Repeated daily injections kept the blood pressure significantly lowered, although elevated temperature was not always present. The animals behaved normally, the appetite remained good and there was no loss of weight. Similar but less striking results were obtained by the intramuscular and subcutaneous injection of the same vaccine. It should be obvious from these observations that great caution should be exercised in drawing any conclusions about the specific effects of renal extracts when a suspension of bacteria can produce a similar effect.

Dr R. W. Scott at the Cleveland City Hospital has found a similar effect on the blood pressure of a few patients with hypertension as a result of the intravenous injection of typhoid vaccine. He has also noted a simi-

lar effect from the intramuscular injection of 5 to 10 cc of boiled milk.

These experiences mentioned recall another which is apropos. Rodbard Katz and Sokolow<sup>44</sup> transplanted a piece of normal kidney under the skin of 7 dogs and attributed the fall of blood pressure which followed to a specific effect of the autolyzed kidney. We were able to show<sup>45</sup> that autolysis of sterile kidney had no effect on the blood pressure of hypertensive dogs, but a definite effect occurred when the transplant was contaminated and an abscess formed at the site of the transplantation. The observations of Friedman, Jarman and Marrus<sup>46</sup> on hypertensive rats are in accord with ours. They found that subcutaneous implants not only of kidney but also of spleen and liver, when infected caused a fall of blood pressure in hypertensive rats, which was not observed without abscess formation. Recently Katz<sup>44</sup> has agreed that the effect was due to the abscess formation which occurred invariably in their first series of animals but still thinks that the autolyzed kidney substance plays a part in the phenomenon.

Levy and Blalock<sup>43</sup> reported that distemper, severe mange or a virulent infection of any type caused a decline of the blood pressure of hypertensive dogs and that animals with distemper rarely responded with elevation of blood pressure as a result of constriction of the main renal arteries. Wakerlin and Gaines<sup>47</sup> found that in 4 hypertensive dogs with distemper the blood pressure came down but returned to the hypertensive level on recovery from the distemper. On the contrary, a mixed staphylococcal and streptococcal cellulitis is reported not to have lowered the blood pressures of 4 other hypertensive animals.

Our experience has been that both distemper and local infection with abscess due to a mixture of bacteria have the effect of lowering the blood pressure of hypertensive animals or of interfering with the development of hypertension due to constriction of the main renal arteries.

#### THE EFFECT OF TREATMENT WITH SUBCUTANEOUS INJECTIONS OF RENAL EXTRACTS CONTAINING RENIN

It has been claimed recently by Wakerlin and his associates<sup>48</sup> that the subcutaneous injection of renal extract containing renin also effects a lowering of the blood pressure in animals with experimental renal hypertension produced by constriction of the main renal arteries. The mechanism whereby this occurs is considered to be the development of a neutralizing substance (antirenin) in the blood. The presence of antirenin in the blood serum has been demonstrated by showing that when equal quantities of renin solution and serum are allowed to stand in the refrigerator for about twenty-four hours there results an inactivation or destruction of the renin which is now incapable of raising the blood pressure when injected directly into the blood stream. Only 4 dogs were used in their experiments. All

42 Rockwell G E. Renal Extract Therapy in Essential Hypertension. Preparation of Extract and Case Reports. *Cincinnati J. Med.* 23: 20 (March) 1942.

showed a fall of blood pressure which began only after the injection had been carried on for about two months. In all the dogs the blood pressure rose again after the injections were discontinued. However, in 1 of the 4 animals the concentration of antirenin in the blood serum remained the same, although the blood pressure returned to the original high level after the injection of renin had been discontinued. This makes it difficult to accept unequivocally the idea that the fall of blood pressure was due to the presence of antirenin in the blood. Williams<sup>45</sup> has reported failure to confirm this result in 2 dogs, while Prinzmetal in a personal communication to Katz<sup>13</sup> has reported a lowering of the blood pressure in 7 hypertensive rabbits in which however, an injection of renin was followed by the usual rise of blood pressure. Many more experiments must be performed to prove the effectiveness of this method and to elucidate the mechanism of its action. The experiments are being repeated in this laboratory with the purest possible hog renin which is being prepared by Dr. Yale Katz, but the results are not yet available.

Winternitz and Katzenstein<sup>47</sup> demonstrated the development of precipitin to kidney extracts containing renin as the result of repeated injections of such extracts. However, they observed the usual pressor response when they injected refrigerated mixtures of kidney extract containing renin and serums of dogs which had received repeated injections of the extract. They failed to confirm the finding of "antirenin" reported by Wakerlin and Johnson<sup>46</sup> and concluded that immunity to the pressor effect of renin did not develop in their animals.

We have also failed to observe the development of "antirenin" in 1 dog that has received renin injections for seven months and in 5 dogs that have received daily intramuscular injections for two months.

It is interesting in this connection that Wakerlin and Games<sup>12</sup> reported a slight elevation of blood pressure in normal and hypertensive dogs when dog renin was injected intramuscularly daily for from one to two and one-half months.

We have injected large quantities of renin intravenously at irregular intervals, at least once a week and often daily, into at least 20 normal dogs and have not observed a consistent effect on the blood pressure over a period of many months. There was always an immediate response of the same magnitude following the intravenous injections of renin, and the blood pressure remained normal in the interim.

#### THE EFFECT OF TYROSINASE ON EXPERIMENTAL HYPERTENSION

Because the chemical nature of the humoral pressor substance causing experimental renal hypertension is unknown, and because it could therefore be a pressor amine, several interesting observations on this possibility have been made. Bing and his associates,<sup>48</sup> using the lung-kidney preparation perfused with heparinized blood, found that the kidney converted dopa into hydroxytyramine only when it was rendered ischemic by clamping the renal artery and reducing renal blood flow about 50 per cent.<sup>49</sup> Bing has suggested that a

similar mechanism might play a part in experimental renal hypertension but does not believe hydroxytyramine is actually concerned because he differentiates it from angiotonin.<sup>50</sup>

Schroeder<sup>51</sup> has also suspected that the pressor substance might possibly be a pressor amine and has used tyrosinase in the treatment of experimental renal hypertension. Tyrosinase has the property of oxidizing monodihydro-oxyphenols and orthodihydro-oxyphenols to nonpressor quinones, so that the rationale of treating hypertension with this drug is good in the absence of further knowledge of the actual nature of the pressor substance.

Schroeder reported that tyrosinase reduced the blood pressure of hypertensive rats and dogs to normal during periods of intravenous therapy with this enzyme.<sup>51</sup> It is well known that local reactions, frequently with a sometimes without fever, are common with subcutaneous or intramuscular injections of tyrosinase. In view of the well known nonspecific depressor effect of such local reactions from any cause whatever, caution will be necessary in interpreting as specific any fall of blood pressure in a hypertensive animal or patient with this mode of injection.

Recently Prinzmetal and his collaborators<sup>52</sup> found that an extract of mushrooms containing tyrosinase, in which the tyrosinase was first inactivated by heat, produced a significant lowering of the blood pressure and a remission of other symptoms of hypertension in rats as the result of the intramuscular injection of the extract. The effects which were observed were striking as those which have been reported by others from the injection of a preparation containing tyrosinase and were therefore unrelated to the enzyme content of the preparation.

#### SUMMARY AND CONCLUSIONS

A long list of substances, many of them used at one time or still being used in the treatment of human hypertension, had no significant effect on the blood pressure when administered to dogs with experimental renal hypertension. Our results with renal extracts of our own preparation, as well as with similar extracts of other investigators, have shown either no effect or at most inconsistent and not very striking lowering of the blood pressure of dogs with experimental renal hypertension.

If the idea is correct that renal arteriosclerosis, arteriolosclerosis and the consequent disturbance of renal hemodynamics are the morphologic and functional basis of most cases of so-called essential hypertension in man, the likelihood of a permanent cure of the hypertension, including the removal of the cause and the effect of such treatment is not very great. It is unlikely that such extracts could effect a reversal of renal vascular disease that probably preceded the development of the hypertension. The only benefit to be expected from this type of treatment is the consistent administration of the renal extract will have effect on the mechanism of formation, the release or the neutralization of the pressor substance or its precursors. In this respect, however, the

would not differ from the treatment of diabetes with insulin or the treatment of pernicious anemia with liver extract. Neither of these diseases has been cured by these treatments.

Before the treatment of hypertension by renal extracts can be recommended for man serious consideration should be given to the possible untoward effects of sudden lowering of the blood pressure in persons with hypertension, especially those with significant impairment of renal excretory function. Indeed renal excretory failure and a fatal outcome might actually be precipitated by such an effect on the blood pressure. It will be necessary to determine with care the type of patient to whom such extracts can be safely administered. Since it is now possible to test the effect of renal extracts on experimental hypertension in animals, they should not be made available for general use until much more has been learned about the nature and mode of action of the effective substance or substances until local or general reactions have been eliminated and until more consistent results have been obtained in many tests on animals with experimental hypertension.

The results so far observed from the treatment of experimental renal hypertension in dogs and rats do not yet justify much optimism about the possible efficacy of such treatment for human hypertension. For the present, the most that can be said is that a faint note of hope has been sounded for the possible medicinal treatment of the most common type of so-called essential hypertension associated with renal vascular disease. Progress in this respect will be hastened because it is now possible to carry out tests on hypertensive animals before they are tried out on man. Empiricism has given way to experimental demonstration but the final acceptance of the value of this contribution must and will depend on the results obtained in the treatment of human hypertension.

## NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E. SMITH, M.D., Acting Secretary

**SULFATHIAZOLE SODIUM**—Sodium 2 sulfanilamidothiazole—Sodium 2 sulfanilthiazole—The sodium salt of sulfathiazole

Sulfathiazole sodium may be prepared by the interaction of sulfathiazole and sodium hydroxide in solution. The product may be isolated by appropriate methods. It is marketed in the form of anhydrous monohydrated or sesquihydrated crystals.

Anhydrous sulfathiazole sodium has the following empirical formula  $C_8H_8O N_2S_2Na$  (M.W. 277.3).

**Actions and Uses**—The sodium salts of sulfathiazole have the same therapeutic activities as sulfathiazole. This compound has proved to be of value in the treatment of severe pneumococcal, meningococcal, staphylococcal and gonococcal infections.

**Dosage**—The intravenous injections of 0.01 Gm. per kilogram of body weight of the sodium salt of sulfathiazole will produce within a few minutes a concentration of approximately 1 mg. of sulfathiazole per hundred cubic centimeters of blood. The usual initial dose of the drug for patients severely ill with pneumonia is based on 0.06 Gm. per kilogram of body weight. Solutions of the drug should be prepared in the same manner as has been advised for solutions of sulfapyridine sodium and the same precautions should be followed in respect to its administration.

### Tests and Standards—

Sulfathiazole sodium occurs as a white to faintly yellowish white odorless crystalline powder possessing a bitter and saline taste. It is soluble in water, ethyl alcohol, methyl alcohol and acetone, slightly soluble in ethyl acetate and isopropyl alcohol, practically insoluble in

benzene, carbon tetrachloride, ether and petroleum ether. Aqueous solutions of sulfathiazole sodium are alkaline to phenolphthalein, the pH of a 5 per cent aqueous solution lies between 9.5 and 10.0.

**Dissolve** 0.1 Gm. of sulfathiazole sodium in 20 cc. of water; the solution is clear and colorless. Divide the solution into two portions. Add to one portion 0.5 cc. of copper sulfate solution and stir; a grayish purple precipitate forms. Add diluted hydrochloric acid dropwise to the other portion until a precipitate forms; filter, wash the precipitate with water and dry it at 100°C. The melting point of the crystals corresponds to that described for sulfathiazole, dip a clean platinum loop in the filtrate; the solution imparts an intense yellow color to a nonluminous flame.

**Dissolve** 0.5 Gm. of sulfathiazole sodium in 5 cc. of water; add 2 cc. of normal sodium hydroxide and boil gently; no ammonia is formed.

The amount of chloride ion must not exceed 0.01 per cent when determined according to the U. S. P. XI, page 487; the amount of sulfate ion must not exceed 0.02 per cent when determined according to the U. S. P. XI, page 488; and the arsenic content after acid destruction of the original substance must not exceed five parts per million as arsenic trioxide when determined according to the U. S. I. XI, page 436.

**Dissolve** 0.5 Gm. of sulfathiazole sodium in 20 cc. of distilled water; add 5 drops of freshly prepared 10 per cent sodium sulfide solution; the darkening produced does not exceed that developed in a control test to which has been added 0.01 mg. of lead.

**Dry** about 1 Gm. of sulfathiazole sodium accurately weighed in a tared weighing bottle to constant weight in a partial vacuum at 100°C; the loss in weight is not more than 9.0 per cent. Transfer about 0.5 Gm. of sulfathiazole sodium accurately weighed to a tared porcelain crucible; add 1 cc. of sulfuric acid and gently ignite the mixture. When fumes have ceased to arise, cool the crucible and add 0.5 cc. of nitric acid and 0.5 cc. of sulfuric acid and continue ignition to constant weight; the weight of the residue is not less than 24 per cent nor more than 26 per cent of the dried substance. **Dissolve** 1 Gm. of sulfathiazole sodium accurately weighed, in 20 cc. of distilled water previously saturated with sulfathiazole at 25°C. Neutralize the solution with tenth normal sulfuric acid using methyl red as the indicator. Allow the mixture to stand for one hour, filter by suction through a tared Gooch crucible; wash the precipitate with small quantities of water previously saturated with sulfathiazole at 25°C and finally dry at 110°C for one hour; the amount of sulfathiazole obtained is not less than 87.4 nor more than 92 per cent of the dried substance.

**Dissolve** about 0.5 Gm. of sulfathiazole sodium accurately weighed in 50 cc. of water and 5 cc. of concentrated hydrochloric acid; cool to 15°C and titrate with tenth molar sodium nitrite solution as directed under Sulfathiazole. Each cubic centimeter of tenth molar sodium nitrite corresponds to 0.02773 Gm. of anhydrous sulfathiazole sodium; the amount of anhydrous sulfathiazole sodium found corresponds to not less than 99 nor more than 101 per cent of the dried substance.

## SULFONAMIDE SENSITIVITY

A chemical theory as to the mechanism of acquired sensitivity to sulfonamide compounds is supported by a study made by Wedum<sup>1</sup> of the Department of Bacteriology, University of Cincinnati, on the antigenicity of sulfonamide azoproteins.

Statistical evidence recently published by Lyons and Balberor<sup>2</sup> indicates that approximately one third of all patients treated with sulfonamide drugs develop a sensitivity to these drugs sufficient to interfere with their subsequent use on these patients. Other investigators have shown that this sensitivity usually develops about nine days after the first administration of the drug and may persist for at least two years.<sup>3</sup> The dominant symptom of the resulting "sulfonamide shock" is a prompt febrile reaction, often reaching higher than 104 F, accompanied by chilliness, erythema, pruritus and conjunctival injection. Attempts to diagnose the hypersensitive state by patch, scratch or intradermal tests or by passive transfer of the patient's serum have almost invariably given negative results. In vitro serum reactions are also negative. Acquired sulfonamide sensitivity to derivatives must therefore differ essentially from the familiar clinical picture of allergy or anaphylaxis.

In order to determine the physiologic mechanism of this acquired sensitivity, attempts were made by the Cincinnati biochemist to sensitize guinea pigs to sulfanilamide, sulfapyridine and sulfathiazole. Each animal received three combined intradermal and intraperitoneal doses of the drug at intervals of three days. The animals were tested by an intradermal injection of an aqueous solution of each drug twenty-nine days after

the last dose. Local skin reactions were not noted. To each of a second group of presumably sensitive guinea pigs was given a shocking dose of the same drug intracardially. Constitutional anaphylactic reactions did not occur. A third group of treated guinea pigs gave negative in vitro reactions on specific precipitin titrations. Evidently sulfonamide compounds are in themselves nonantigenic and cannot serve as sensitizing, immunizing or testing reagents. Theoretically, the way these drugs could function as antigens, therefore, would be as haptens conjugated with a colloidal protein carrier.

In order to confirm this deduced hapten function of the three sulfonamide compounds, each was conjugated with egg white, beef serum, human serum or rabbit serum by the Landsteiner technique. The resulting sulfonamide azoproteins were used as sensitizing agents for a series of guinea pigs. Twenty-nine days after the final sensitizing dose the guinea pigs all gave positive reactions to intracutaneous tests with the same protein conjugates, in some cases the reaction being sufficient to cause local necrosis. Cross sensitization was noted with these hapten conjugates. Sulfanilamide and beef proteins, for example, gave positive reactions in guinea pigs sensitized with sulfanilamide azoprotein and serum proteins and vice versa. Reactions with homologous protein, however, was always stronger.

A second group of similarly sensitized guinea pigs was tested for constitutional anaphylaxis by intracardiac injections. Lethal anaphylactic reactions were noted in approximately a third of the cases, with an average number of sublethal shocks. Here also cross reactions were recorded, though less numerous than in the previous intracutaneous tests.

Numerous rabbits received repeated injections of the hapten conjugates. All rabbits yielded positive reactions for homologous chemoproteins. Cross reactions were noted. There was a suggestion of a serologic grade of specificity among the three sulfonamide compounds tested, sulfathiazole having the broadest base of antigenicity. Sulfanilamide was most highly antigenic. These findings are in accord with previously reported clinical experience.

Wedum concludes that there is no evidence that simple uncombined sulfonamide compounds can function either as sensitizing or as testing antigens. Guinea pigs presumably sensitized with these simple compounds do not respond when tested with corresponding protein conjugates. Animals demonstrated to be sensitive to the hapten conjugates also give negative reactions with the uncombined sulfonamide compounds. It is not clear whether or not it would be possible to desensitize or

nize guinea pigs against these hapten conjugates and the effect of such desensitization on the therapeutic efficiency of the uncombined sulfonamide drugs, have not yet been reported from the Cincinnati laboratory.

### THE HARMLESSNESS OF GLYCOSURIA FOR A PATIENT TREATED WITH PROTAMINE ZINC INSULIN

In the treatment of moderately severe and severe diabetes with protamine zinc insulin Tolstoi and his associates have encountered patients who, on a diet of 200 to 250 Gm of carbohydrate exhibited either intermittent or continuous severe glycosuria. When they attempted to treat this glycosuria by increasing the dose of protamine zinc insulin the urine became free from sugar but the patient suffered from insulin reactions, at times of alarming severity. In spite, however, of the persistent glycosuria some of these patients had good health, maintained their weight and were free from any symptoms of diabetes. These authors<sup>1</sup> treated 84 patients with one daily dose of protamine zinc insulin without a particular effort to maintain their urines free from sugar. Twenty-seven of these patients had more or less continuous glycosuria throughout the period of study, which lasted one year. The great majority of them maintained weight, and many gained. Symptoms of diabetes did not appear in any of them, and only one developed acetonuria. The incidence of infections was not greater in this group than in other patients. Allen and Du Bois, in their calorimetric studies found that the diabetic person can and does utilize carbohydrate in the presence of hyperglycemia and glycosuria. This utilization of carbohydrate can be prolonged by insulin. Apparently their patients metabolized sufficient carbohydrate, in spite of the pronounced excretion of dextrose so as to approach the physiologic ideal. When confronted with the problem of maintaining the urine sugar free at the cost of severe insulin reactions, these authors unequivocally prefer glycosuria. In their experience, maintenance of weight, freedom from symptoms of diabetes and absence of ketone bodies in the urine are safe guiding principles in the management of patients on a single daily dose of protamine zinc insulin.

This attitude toward glycosuria was severely criticized by Joslin and his associates.<sup>2</sup> While admitting that there is no positive proof that certain harmful effects, such as lack of resistance to infection, degen-

erative phenomena in arteries and nerves, weakness, weariness and impotence, are due to hyperglycemia per se, they nevertheless are emphatic in stating that glycosuria of 5 per cent or more and freedom from the symptoms mentioned are incompatible.

Tolstoi and his associates<sup>3</sup> in a recent communication, report a careful study of a severe case of diabetes in which treatment with multiple injections of insulin, aiming at a normal blood sugar and sugar free urine, failed to produce as good clinical results as a single dose of protamine zinc insulin without attempt to abolish hyperglycemia and glycosuria. On the latter regimen, weight was maintained, the patient remained in positive nitrogen balance and he was free from symptoms of diabetes but occasionally suffered mild insulin reactions. Despite the severe and continuous glycosuria for three years, the patient has not had any more colds or other infections than nondiabetic patients, his renal function was not impaired and his atherosclerosis did not demonstrably increase. The minimizing of importance of glycosuria in patients treated with protamine zinc insulin presents a new concept and as such will have to be subjected to further clinical investigation before a final evaluation.

### Current Comment

#### JAUNDICE FOLLOWING YELLOW FEVER VACCINATION

As THE JOURNAL goes to press it may be announced that the incidence of cases of jaundice following vaccination against yellow fever is decreasing. Since such cases first appeared, investigators of the highest repute in the fields of epidemiology, pathology, infectious diseases and viruses have been intensively engaged in a study of the factors concerned. There is in the minds of those familiar with the situation the firm conviction that the condition concerned certainly is *not yellow fever*. There seems to be no reason to believe that it is yellow fever or any abortive or mild form of that disease. The vaccine concerned gives actual protection against yellow fever. Only a few batches of vaccine seem to have been involved, although obviously many thousands of men were inoculated with material from each batch. The investigators feel that the technic of preparation now in use will be followed shortly by a discontinuance of new cases. It must be remembered, however, that the incubation period may be months in duration. The jaundice concerned has not noticeably affected the civilian population. An official statement in the form of an army medical department circular will be issued in the near future.

## MECHANICAL ASPECTS OF SURVIVAL FROM FALLS

The high incidence of fatal automobile accidents and the serious loss of pilots due to increased landing speeds of military planes are matters of grave national concern. Some persons can receive fatal injuries from falling only a few feet, whereas others who have fallen from great heights have from time to time survived. In some instances the mechanical factors leading to death or survival from such falls are subject to accurate analysis. DeHaven,<sup>1</sup> in the July issue of *War Medicine*, attempts such an analysis with the objective of studying the physiologic results of rapid deceleration in order to establish a working knowledge of the force and tolerance limits of the body. The 7 cases he presents involve survival from falls 50 to 150 feet in height. In several of them the speed of fall, position, deceleration and relation of resultant injuries to structure could be determined with great precision. It is obvious, he points out, that speed and height of fall alone are not of themselves injurious. Moderate change of velocity, such as occurs after a ten story fall into a fire net, is far different from the rate of change of velocity which occurs after a fall of similar height on to concrete. The velocity reached in cases of free fall (defined as a fall free of any obstruction other than that encountered at its termination) can be estimated from an acceleration equation (in vacuum), from which is deducted an estimate of the slowing effect of air resistance. In this manner the resultant speed or velocity of the body at contact can be estimated with reasonable accuracy. The rate of deceleration, however, presents much greater difficulties. Even in falls to earth there is a variation of deceleration distance of the fall for certain parts of the body, e. g. the hand, which might be stopped in a distance of 2 inches, whereas the hips might leave a mark of 5 or 6 inches. In falls to structures such as automobiles, the conditions might be still more confused. From the analysis of his 7 cases DeHaven concludes that the human body can tolerate and expend a force of two hundred times the force of gravity for brief intervals during which the force acts in transverse relation to the long axis of the body. Since a slip on the street in which the head strikes the hard pavement may induce a gravity increase exceeding 300 g (the value of gravity in the acceleration [32 feet] per second) because of the small deceleration factor involved, the explanation for the apparent discrepancy between height of fall and injury becomes readily apparent. The cases he presents show physiologic evidence of well known mechanical and physical laws. Furthermore, the fact that survival occurs when the necessary factors are accidentally contributed indicates the probability that structural provisions can be introduced into automotive and airplane design which will reduce impact and distribute pressure, thus enhancing possibilities of survival and modifying injury.

## MEDICAL PROBLEMS OF SELECTIVE SERVICE

Elsewhere in this issue appear two contributions of great importance to the medical profession.<sup>1</sup> From the moment when Selective Service first began to function the complete cooperation of physicians was tendered to it. The calm judgment of General Hershey and the work of his medical staff in the National Headquarters have been outstanding for their wisdom and effectiveness. Although innumerable attempts have been made to stampede the Selective Service System into various welfare programs—venereal disease, prehabilitation, rehabilitation, physical fitness and what not—its leaders have held steadfastly to their main objective—the securing of a sufficient number of men sufficiently fit to meet the varying needs of the armed forces. As pointed out by both General Hershey and Colonel Rowntree the Selective Service System has at the same time cooperated fully in maintaining both premedical and medical education, in retaining essential physicians for teaching and the civilian population, and in the conduct of pilot experiments to determine the worthiness of such programs as prehabilitation and rehabilitation before establishing them on a national scale. Apparently General Hershey has concluded that rehabilitation is “one of the methods by which our manpower may be made more efficient” but that “the results obtained to date do not justify a program of physical rehabilitation by Selective Service.” The program is therefore being submitted by General Hershey to the War Reliance Commission. The medical profession may commend the type of scientific study and decision that have been exemplified by the leaders of Selective Service in this phase of their work. The procedure may well serve as a model for a functioning democracy.

### EUGENE L. OPIE

The July number of the *Archives of Pathology* is a special issue dedicated to Dr. Eugene L. Opie, emeritus professor of pathology at Cornell University Medical College, by his former associates on the occasion of his retirement. Some facets of Opie's accomplishments and personality are presented in the opening article contributed by Peyton Rous. Within a few months of entering Johns Hopkins Medical School (from which he and William MacCallum were among the first graduates) Dr. Opie developed a special interest in Langerhans cells of the pancreas, the function of which he did much to elucidate. Many of his other scientific investigations, especially in the field of cancer, now have become classic. Opie's modesty and ingenuity are well honored by his colleagues. The preparation and dedication of this special issue of the *Archives of Pathology*. Such contributions by Krumbhaar, Cecil, MacCallum and Mudd and others, are an indication of the great recognition that Dr. Opie's work has had.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## THE SELECTIVE SERVICE AND ITS MEDICAL PROBLEMS

MAJOR GENERAL LEWIS B. HERSHEY  
Washington, D. C.

I am happy to address your meeting as I wish to express my appreciation to you personally and from National Headquarters of Selective Service to the physicians of this country for your work and help in Selective Service. Those of you who are here represent many men at home who are also serving their country at this time.

I am fortunate in having as advisers various committees and groups in your profession who have helped and advised me in the matter of deferment of medical students, physicians, the procurement of physicians and various problems that arose in Selective Service with regard to medical matters.

There are two or three things I wish to talk to you about: first, the physical examination as now conducted in Selective Service, second, rehabilitation, and, third, I want to say something about the part Selective Service will play in the future in the selection of manpower and assignment of the medical profession.

In October 1940 the Army and Navy Selective Service Committee formulated plans to be used in the mobilization of manpower in the United States. These plans were based on the experience of World War I. The physical examinations of 1917 and 1918 were given by the local boards and the men were then inducted and sent to the Army. The Army exercised its right to reexamine these men after their arrival in camp, and as a result 250,000 were rejected and sent home. This system was obviously one to be avoided. It had resulted in burdening the transportation system with many thousands of miles of unnecessary travel. It had dislocated registrants in their everyday life to take them to camps for a short period of time and then return them to pick up the threads of their life again.

In the planning which took place in the War Department in the years since World War I, it was decided that certain general principles should be observed in induction examination. In the first place, a man should not be inducted into the service until he has passed his final physical examination. Second, this final physical examination should be given as near to his home as possible. The experience of the World War had demonstrated that the dual examination regardless of its other merits resulted in misunderstanding, uncertainty for the registrant, and the general feeling on the part of the public that a wide difference of opinion

existed among doctors on the qualifications for a soldier. These principles led the Planning Division of the War Department General Staff to set up a single examination given by the Army.

When the Selective Training and Service Act was passed, the War Department did not feel that it had sufficient doctors to put this plan into effect. The result of this decision was a reversion to the dual examination system which had not been satisfactory during the war. Inevitably the results anticipated occurred. Men who were passed by their local board examiner made arrangements to leave civil life and were returned rejected by the army induction boards.

To rectify this situation a preinduction examination was provided by the Army. Under this method men were sent to army examining boards well ahead of their induction date. This resulted in a considerable amount of travel, but it did provide definite information to the man as to his physical qualifications prior to the time it was necessary for him to settle up his civilian business. This system would have been successful, undoubtedly, had it not been for the onset of war. War brought a change in conditions, an intensification of recruiting by the Army and the Navy. Men who had been physically examined, who knew that they were qualified for military service, became the prize pool from which recruiters drew their men. It was impossible to make any accurate estimate of how many men would be available for induction two weeks after the completion of a successful physical examination. The War Department felt that in self protection it must induct a man immediately after he was physically examined. To overcome the objection that men would be uncertain in the settling up of their business, the War Department undertook to provide emergency furloughs for those who needed additional time. This plan was not satisfactory, and ultimately the War Department decided to give furloughs to all men after their induction to permit them to close up their civilian activities.

The place of the local board examiner since the institution of the preinduction examination has been one of uncertainty. The Selective Service System attempted to use the medical examiner of the local board for the purpose of making a screening examination, with particular emphasis on the furnishing of information concerning the emotional and mental stability of the registrant for use of the army induction board. This type of screening examination has not been satisfactory to the medical examiners. The continuing increase in the demand for doctors raises a question as to whether or not the screening examination of the registrant should be continued.

I wish to speak now about physical rehabilitation. By rehabilitation I do not refer to the voluntary kind

in which a man seeks the correction of his own defects but to that plan which applies to a rehabilitation program by Selective Service for men who have been rejected by the Army. An attempt was made to publicize and popularize a rehabilitation plan for these men who had been rejected by the Army. The Army did not care to rehabilitate any one because it was too busy doing other things and in addition did not have the available physicians and hospital facilities. Selective Service was assigned the job (by the President) to rehabilitate individuals with minor correctable defects who otherwise were ready for induction.

Last autumn a large representative group from the medical profession and allied interests met in Washington to discuss rehabilitation. It was the unanimous opinion of its members that the assignment was a difficult one and that they did not want to do it but they offered their wholehearted support in the event that Selective Service undertook the task.

Before money could be secured for this plan of physical rehabilitation, war came upon us. Then the situation changed. With the problem of procuring much larger numbers of men for the armed forces, physical standards were lowered. The activities of the local boards were multiplied through increased quotas, additional registration and occupational questionnaires. Medical man hours changed from limited to precious. Twenty per cent of those formerly rejected for service were accepted or were placed in I-B classification instead of IV-F or totally rejected.

The pilot test conducted in Maryland and Virginia received able cooperation from the medical profession. The results obtained to date do not justify a program of physical rehabilitation by Selective Service.

The President has created a War Manpower Commission to coordinate all efforts pertaining to manpower. Rehabilitation is one of the methods by which our manpower may be made more efficient. I shall submit to the War Manpower Commission a report of

the experience of the Selective Service System with rehabilitation for its consideration and action.

I stated in outlining this address that I wish to tell you a moment about doctors. There is a scarcity of medical personnel, an over-all shortage. At present we need all the medical brains we have available. May I observe in passing that Selective Service must recognize a doctor on the basis of the license issued by the state. Two actions must be taken: the maximum professional use must be made immediately of every doctor we have in the services or in civilian practice, the training of additional doctors must be assisted and expedited.

No doctor should be inducted unless he will be needed by the armed forces in a professional capacity. The Procurement and Assignment Service will assist the Selective Service with information and advice as to the availability of doctors. This information and all other information available on a registrant doctor will be accumulated and used by the local board in arriving at its decision. On the information so obtained the local board and it alone will decide the classification of the doctor.

Selective Service has protected the medical student. This has extended down into the premedical group. Those students accepted by medical schools for matriculation will be deferred to complete their education, provided they continue to show promise of being acceptable students. The protection of premedical students has been extended under the junior rule, which also applies to chemical, engineering and other technical students. This means that students in their first two years of premedical work who show promise of reaching the ultimate goal will be deferred so as to finish their medical education.

It has been a privilege and a pleasure to speak to you and to express my appreciation of all that you have done in Selective Service. My association with your profession convinces me that you will meet the needs of both the armed forces and our civilian population. How it will be done, the future alone can answer.

### FEDERAL LOANS TO COLLEGE STUDENTS

The loan fund of \$5,000,000 voted by Congress to help college students speed up their training for technical and professional jobs will be available soon, Paul V. McNutt, War Manpower Commission chairman, announced on July 17. Monthly loans totaling not more than \$500 a year, at 2.5 per cent interest annually and canceled if the student is drafted during training, will be made directly to students by colleges or universities and by public or college connected agencies. Federal funds will be allocated to the lending institutions by the U. S. Office of Education. Bulletins announcing the program are being sent to all colleges and universities in the United States.

This financial assistance will permit students to pursue intensive programs of study to meet the need for technicians. Loans are available only to students who are registered in accelerated programs in degree granting colleges and universities and whose technical or professional education can be completed within two years, in one of the following fields: engineering, physics, chemistry, medicine (including veterinary), dentistry and pharmacy. The student agrees in writing (1) to participate, until otherwise directed by the chairman of the War Manpower Commission, in accelerated programs of study in any of the authorized fields and (2) to engage for the duration of the war in which the United States is now engaged in such employment or service as may be assigned by officers or agencies designated by the chairman of the War Manpower Commission. Students must be in need of assistance and must attain and continue to maintain satisfactory standards of scholarship.

Loans shall be made in amounts not exceeding tuition fees plus \$25 a month and not exceeding a total of \$500 to one student during any twelve month period. Loans are evidenced by notes executed by student borrowers payable to the Treasurer of the United States. Repayments of loans to be made through the colleges, universities or other agencies negotiating the loans, to be covered into the treasury by miscellaneous receipts. The indebtedness of a student shall be canceled (1) if before completing his course he is ordered to military service during the present war under the Training and Service Act of 1940, as amended, or (2) if he suffers total and permanent disability or (3) in any other case.

### NURSES TO THE COLORS

To aid nurses in reaching a decision as to whether they should serve on the "home front" or with the armed forces, the National Nursing Council for War Service has developed classifications which will help nurses and the local health council to make a decision. These classifications have been developed also by the American Red Cross and the Health Administration Committee of the Office of Defense Health Administration and its Subcommittee on Nursing. These classifications are published lists of categories in which nurses should serve: (1) in the armed forces or (2) at home. For example: "You should serve with the armed forces if you are single, under 40 and are doing private duty."

of categories under 'You should serve at home' is if you have a position in a hospital which has a school of nursing as (a) administrator in a key position, (b) instructor, (c) supervisor, (d) head nurse, in a position related to supervision, and so on.

This leaflet, which will be mailed by the National Nursing Council for War Service, 1790 Broadway, New York City, free on request, points out that the Army and Navy are now asking for many thousands of nurses. Nurses who wish to enter the military service should enroll in the First Reserve of the Red Cross Nursing Service for assignment to the Army Nurse Corps or the Navy Nurse Corps. Each nurse is urged in this leaflet to get in touch with the Local Nursing Council for War Service or the local American Red Cross Chapter for information about enrollment.

The National Nursing Council for War Service will also send free, on request, a booklet, "Distribution of Nursing Service During the War," which gives advice on how to organize a local nursing council.

### CONFERENCE ON HEALTH OF WORKERS IN ORDNANCE PLANTS

Medical directors and safety engineers responsible for measures safeguarding the health of army ordnance manufacturing plant workers met July 17-18 in St. Louis to discuss the scientific advances in industrial hygiene. The War Department announced, July 16, Col. A. B. Johnson, Office of the Chief of Ordnance, presided. The purpose of the conference was to set forth new phases of industrial hygiene which will contribute to improved health, safety and working conditions of those making munitions. The speakers were as follows:

July 17: W. D. Norwood, M.D., medical director, Kankakee Ordnance Works, Joliet, Ill.; 'T. N. T. Poisoning', G. H. Gehrmann, M.D., medical director, E. I. du Pont de Nemours & Co., Wilmington, Del.; "Toxicology in the Manufacture of Munitions", Louis Schwartz, M.D., National Institute of Health, Bethesda, Md.; 'Dermatoses in the Manufacture of Munitions', R. H. Flinn, M.D., National Institute of Health; "Recommended Medical Services", Lieut. Col. A. J. Lanza, Army Surgeon General's Office, Washington, D. C.; "Periodic Physical Examinations", Max Burnell, M.D., General Motors Corporation, 'Women in Industry'.

July 18: A. D. Brandt, D.Sc., National Institute of Health, 'Engineering Control of Toxic Exposures', H. H. Schrenk, Ph.D., U. S. Bureau of Mines, Pittsburgh; 'Personal Protective Equipment in Toxic Exposures', Capt. W. J. Niederauer, Office, Chief of Ordnance, 'Principles of an Industrial Safety Program', discussion on 'Industrial Nutrition', H. L. Schultz, M.D., Elwood Ordnance Plant, Elwood, Ill.; 'Disaster Planning and Emergency Medical Services', Colonel Johnson; 'Summary of Conference and Future Plans'.

### WAR RECREATION CONGRESS

To expand and intensify the war service of the recreation forces of America is the purpose of the War Recreation Congress being called in Cincinnati September 28-October 2. Representatives of the armed forces, the federal government departments, local officials, industry, private agencies and other community leaders will face together ways and means of using recreation to serve more effectively the war effort. Special meetings will deal with recreation for service men, for war production workers and for civilian needs in wartime. Consideration will also be given to long range plans for recreation after the war.

President Roosevelt, who for a long time has been a member of the National Recreation Association, expressed to Mr. Howard Braucher, president of the association, his earnest hope that the congress would be successful. President Roosevelt said that the recreation services being provided for the armed forces, for workers in war industries and for the morale of civilian groups are definitely contributing to the war effort.

For over thirty-five years the National Recreation Association has served as the clearing house for the recreation movement in America. The special purpose of the War Recreation

Congress is to help further to mobilize the recreation movement behind the war effort. The five general sessions of the congress will be addressed by leaders from the federal government, the armed forces, industry, labor and other fields. Discussion groups will meet to consider topics based on material found in a pamphlet, which will be sent to each delegate during September. The announcement asks delegates to bring questions and answers to the congress in Cincinnati that all may face them together to the end that all recreation work during the coming year may count toward winning the war.

For further information concerning this meeting, address Mr. T. E. Rivers, National Recreation Association, 315 Fourth Avenue, New York City.

### NEW APPOINTMENTS

Dr. David D. Rutstein, chief of the cardiac bureau of the New York State Department of Health, Albany, has been appointed to the staff of the Medical Division, Office of Civilian Defense, Washington, D. C., as medical gas officer to organize instruction for physicians of Eastern states in the medical aspects of chemical warfare. A native of Pennsylvania, Dr. Rutstein graduated from Harvard University in 1930 and from Harvard Medical School in 1934. In 1937 Dr. Rutstein was appointed medical consultant to the bureau of pneumonia control of the New York State Department of Health and continued in that capacity until 1941, when he became chief of the cardiac bureau. He is now on leave from that position. While in Albany, Dr. Rutstein also was a member of the faculty of Albany Medical College. Dr. Rutstein has been certified by the American Board of Internal Medicine.

Dr. Fred T. Foard, Surgeon, U. S. Public Health Service, has been assigned as regional medical officer for the ninth civilian defense region with headquarters in San Francisco. Dr. Foard graduated from the University of Maryland School of Medicine in 1916 and entered the Public Health Service in 1917 as a scientific assistant. He has directed rural sanitation projects and county health work in many parts of the United States. Special activities in which he has engaged include sanitation work in extracantonment areas during World War I, and in connection with flood control at Jackson, Miss., in 1927.

### COUNTY MEDICAL SOCIETY ESTABLISHES BLOOD BANK

The San Francisco County Medical Society, San Francisco, established last July the Irwin Memorial Blood Bank, which to date has received blood from 8,544 donors and thus has been able to provide an invaluable community service for civilians who were sick or injured and supplementary aid to the defense program. The blood bank sends to the hospitals of the San Francisco metropolitan area about 500 units of whole blood each month, for which the maintenance cost has been stabilized at \$750 per pint, plus a donor. Twenty-four hospitals now call on the Irwin Memorial Blood Bank, and at the present rate of growth it is expected that this heavily populated area will need about twice the amount of blood it is now receiving. Many emergency stations and hospitals were stocked from the blood bank the day war was declared, and several hundred portable transfusion kits containing dried plasma had been placed aboard ships of the United Nations. An hour has been set aside each week for medical officers of the armed forces to see the plant in actual operation.

### DIABETIC IDENTIFICATION CARDS

*Philadelphia Medicine* July 18 states that the Commission on Diabetes of the Pennsylvania State Medical Society has furnished identification disks and cards for all diabetic persons, which may be procured at the County Medical Society Building, Twenty-First and Spruce streets, Philadelphia, and at the Philadelphia Metabolic Association, 123 South Broad Street. There are available tags for patients who use insulin and tags for those who do not use insulin. The identification cards which the patients are to fill out, however, are identical.

# ORGANIZATION SECTION

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

*Changes in Status*—S 2676 has been reported to the Senate, to provide for medical care and funeral expenses for certain members of the Naval Reserve Officers' Training Corps. This bill provides that members of the corps, including members who have heretofore suffered disability during the present war or the national emergency preceding it, who suffer disability from personal injury, illness or disease occurring in line of duty while en route to or from and while participating in authorized practice cruises shall be entitled at government expense to such hospitalization, rehospitalization and medical and surgical care and treatment, in hospitals or at their homes, as is necessary for the appropriate treatment of such personal

injury, illness or disease until the disability resulting therefrom cannot be materially improved by hospitalization or treatment. H R 7164 has passed the House and Senate, to amend the Soldiers' and Sailors' Civil Relief Act of 1940. Among other things, this bill extends the benefits provided in the original act to transactions occurring subsequent to Oct 17, 1940 and contains a provision under which leases may be terminated by persons who enter military service when such leases cover premises occupied for dwelling, professional, business, agricultural or similar purposes. Under the original act no provision was made for the cancellation of leases, nor did the benefits contained in the original act in connection with leases apply to leases on premises used for professional or business purposes.

## WOMAN'S AUXILIARY

### California

The thirteenth annual session of the Woman's Auxiliary to the California Medical Association was held, May 4-5, at the Del Monte Hotel, Monterey. At the opening session of the California Medical Association Mrs Harry O Hund, president of the state auxiliary, presented a \$735 check to the California Medical Association Benevolence Fund. A general meeting was held on Tuesday. The speakers included Mrs Dewey R Powell, William R Molony and George H Kress. A luncheon honoring Mrs F G Lindemulder, president-elect, concluded the activities.

### Illinois

At a recent meeting of the auxiliary to the Bureau County Medical Society Mrs R E Davies of Spring Valley showed pictures of Guatemala and tapestries collected during her trip there.

Mrs Christine Ryman Pensinger, supervisor of Institutional Housekeeping for the State of Illinois, spoke at a joint meeting of Vermilion County medical auxiliary and the American Association of University Women recently on "Housekeeping in the Institutions and the Place of the Homemaker in the War". The speaker is now cooperating with Governor Green in planning a program to help housewives face problems which the war has created in the home.

Miss Harriet Fulmer, R N, supervisor of nurses for Cook County Health Unit, spoke on "History of Rural Nursing Service in Cook County" at the February meeting of the auxiliary to the Chicago Medical Society.

### Ohio

The Woman's Auxiliary to the Hempstead Academy of Medicine (Scioto County) held its annual spring luncheon on May 13 at Portsmouth. Speakers at the meeting were Mrs Helen Davis Holcombe, past national president of the Woman's Auxiliary to the American Medical Association, Mrs Eleanor Osborne, president of the Woman's Auxiliary to the Ohio State Medical Association, Dr Carl G Braunlin, president of the Hempstead Academy of Medicine, and Mr R F Fletcher of the Portsmouth Times. A radio broadcast by a member of the local auxiliary on diphtheria immunization was heard. Health education broadcasts are a regular feature of the Hempstead auxiliary over the local radio station.

### Oklahoma

The Woman's Auxiliary to the Oklahoma State Medical Association met in Tulsa in April under the presidency of Mrs Edward D Greenberger, with one hundred and five registered. The eight counties organized had representatives present with reports of their activities throughout the year.

Muskogee County, organized during the year, won honorable mention in the American Medical Association *Hygeia* contest. The public relations and philanthropic work of Pittsburg County (McAlester) was outstanding. Oklahoma County has the largest membership, with one hundred and thirty-eight active members. Representatives from a large number of woman's clubs were present. Tulsa gave sixty-one six month *Hygeia* subscriptions to county schools and gave the county medical society \$75 for their library.

### Washington

The open public relations meeting of the Pierce County auxiliary in Tacoma, March 12, was attended by one hundred and sixty-five. Dr Jennie Roundtree of the University of Washington spoke on nutrition.

At the March meeting of the Cowlitz County auxiliary, Mrs Clyde Shurer, executive secretary of the Red Cross, spoke on blood banks.

The March meeting of the Yakima County auxiliary was addressed by Dr D S Corpron on his experience as a medical missionary in China.

### Wisconsin

The Kenosha County auxiliary met at the home of Mrs Ilef Lokvam, March 3. Judson Staplekamp spoke concerning the civilian defense project in Kenosha, and the auxiliary donated \$25 to this cause. Mrs Edgar Andre was appointed chairman of the committee to finance the sending of girl scouts to camp this summer.

At a joint meeting of the woman's auxiliary to the Brown Kewaunee-Door County Medical Society and the Green Bay and DePere units of the Women's Field Army, March 25, Mrs G E Stoddart, Beaver Dam, state commander, spoke on the curability of cancer in its early stages. Mrs George Goggins, president of the auxiliary, presided.

The auxiliary to the Milwaukee County Medical Society held a luncheon meeting in Milwaukee, March 13. Ninety seven members were present and twenty-two members of the minstrel chorus of the medical society later entertained. Dr R E Fitzgerald addressed the group on "Procurement and Assignment". The proceeds (\$247.50) of a benefit card party were turned over to the Red Cross.

At a meeting of the auxiliary to the Racine County Medical Society, Mrs I F Thompson reviewed an article in *Hygeia* entitled "How Well Do You Know Your First Aid?" Miss Louise Thompson talked on "Nutrition and Meal Planning as Taught at Park High" and displayed posters made by 15 students of the home economics class.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Physicians Wanted**—Physicians at least 21 years of age are wanted for temporary and permanent positions at the Olive View Sanatorium by the Los Angeles County Civil Service Commission. Salary will be \$225 a month. Necessary qualifications include graduation with the degree of M.D. from an approved medical school and the completion of at least one year's internship in an approved hospital. Qualified persons over 55 years of age may file for the temporary or duration appointments. Complete information may be obtained from the office of the commission, Room 102, Hall of Records, Los Angeles. All applications must be received on or before August 25.

### CONNECTICUT

**Physician Pleads Guilty to Violation of Espionage Act**—Dr. Wolfgang Ebell, El Paso, Texas, a native of Zabern, Alsace, pleaded guilty in a federal court in Hartford July 14 to a charge of conspiring to violate the Espionage Act of 1911 according to the *New York Times*. The physician was said to be furnishing military secrets of the United States to Germany and Japan. He entered the guilty plea following a former plea of innocence the *Times* stated. Dr. Ebell graduated at the Albert Ludwigs Universität Medizinische Fakultät Freiburg, Baden, Germany, in 1923. He was licensed in Texas in 1930.

**Cancer Progress in Connecticut**—The state department of health recently established a tumor registry of slides in the department of pathology at Yale University School of Medicine, New Haven, to serve as a storehouse of material for study and for assisting in standardizing the diagnosis and grading of tumors. Twenty-five specimens with complete records have been registered since April 1. Dr. Robert Tennant, assistant professor of pathology and surgery at the medical school and pathologist at the Hartford Hospital, is the registrar. The registry is an extension of the cancer program that was inaugurated in Connecticut in 1935 through the general efforts of the state medical society, the Connecticut Society of Pathologists and the state department of health. The tumor committee of the state medical society acts as a policy making advisory committee. Under the program the society of pathologists has agreed on a standard nomenclature that has been accepted throughout the state. The division of cancer research of the state department of health has set up and systematized a standard tumor record form and is collecting coding and analyzing the records of every patient with a malignant growth admitted to each of the twenty-one cooperating hospitals, keeping the form for the period from 1935 to and including the present. In May 1941 an act signed by the governor appropriated \$50,000 to the state department of health to be used for the study of cancer and the maintenance of diagnostic and treatment clinics for the period ending June 30, 1943. The public health council of the state health department and the tumor committee of the state medical society approved the allocation of funds to twenty-one hospitals keeping the standard tumor records on the basis of actual services rendered for a twelve month period. The records for the calendar year 1939 were chosen as the basis on which the initial allocation of funds was made. A seven point plan of appraising service rendered by evaluating the hospital records of all neoplasms admitted was established. A result of subsequent study showed that 73.8 per cent of all the malignant growths in the twenty-one hospitals were proved by microscopic diagnosis in 1940. One thousand dollars was allotted from the state's appropriations of \$50,000 to the tumor registry. It was decided to register tumors of lymphoid tissues, bone, the ovary and the nervous system. For each group of tumors a board of three pathologists was to establish a system of nomenclature as an expansion of the present code and to submit diagnoses on material referred from the central registry. A part time personnel maintains the work of the registry under remuneration from the cancer funds of the state. Tumor clinics throughout the state send to the registry a block (in cases in which all available tissue has been embedded in unstained slides may be submitted) of tissue fixed in 10 per cent neutral solution of formaldehyde and an assembly of all pertinent clinical

data that is a duplicate of the tumor clinic record or, when indicated, an expansion of this, in certain instances, for example bone tumors the roentgenograms or prints made from these in quadruplicate for filing with the records. Information classified in the registry is returned to the original clinic for cross index purposes, the registry to be responsible for follow-up work through the clinics.

### DISTRICT OF COLUMBIA

**Dr. McGovern Receives Service Award**—Dr. Francis X. McGovern, Washington, retiring chairman of the executive committee of the Medical Society of the District of Columbia, was recently presented with the society's Certificate of Award for Meritorious Service. Dr. McGovern has been an officer of the society for the past seven years.

### FLORIDA

**Changes in Examining Board**—Dr. Isaac W. Chandler, Avon Park, was elected president of the state board of medical examiners succeeding Dr. Harold D. Van Schaick, Jacksonville. Dr. Howard G. Holland, Leesburg, was named vice president. Dr. William M. Rowlett, Tampa, secretary and treasurer of the board since it was established was reelected.

**New State Health Officer**—Dr. Henry Hanson has been appointed state health officer, effective July 15, succeeding Dr. William H. Pickett, Jacksonville, who has been commissioned in the U. S. Public Health Service. Dr. Pickett has been state health officer since January 1941 and is president of the Florida Public Health Association. Dr. Hanson formerly served as health officer of Florida and recently has been working in South America chiefly in Ecuador and Peru as technical adviser in bubonic plague eradication and in jungle fever and malaria control.

### ILLINOIS

**Changes in Health Officers**—Dr. Cecil A. Z. Sharp, state district health officer, Highland, has been placed in charge of a new health unit in Will County, it is reported. Dr. Albert C. Baxter, Springfield, has been appointed state district health officer, with headquarters in Pana. Dr. Baxter formerly served as acting state health officer.

**Committee on Youth and Welfare**—Governor Green recently appointed a committee on youth and welfare as a part of the Illinois State Council of Defense to obviate any tendency toward delinquency brought on by abnormal conditions caused by the national emergency. The committee's activities have been placed under the supervision of the state division for delinquency prevention. Members of the executive committee include Judge B. Harry Reck, Mendota, chairman, Samuel R. Ryerson, Springfield, vice chairman and executive director, William A. Lewis, Chicago, R. W. Fairchild, Normal, Judge Harlington Wood, Springfield, Mrs. Jessie Scofield, Peoria, Rodney H. Brandon, Springfield, and Dr. Julius H. Hess, Chicago.

### Chicago

**Personal**—Dr. Loyal Davis, chairman of the division of surgery, Northwestern University School of Medicine, was elected president of the university's alumni association on June 23.

**Squibb Award to Dr. Koch**—The Squibb Award of \$1,000, administered by the Association for the Study of Internal Secretions, was presented to Fred C. Koch, Ph.D., Frank P. Hixon, distinguished service professor emeritus of biochemistry, University of Chicago, during the annual meeting of the association in Atlantic City, June 8. The award was established in 1939 to encourage investigations in endocrinology.

**New Director of Tuberculosis Rehabilitation Service**—Marvin Halsey, B.A., associate director, has been appointed director of the Rehabilitation Service of the Tuberculosis Institute of Chicago and Cook County, succeeding Morton A. Seidenfeld, Ph.D., who has entered army service. Mr. Halsey served as director of rehabilitation at the Hamilton County Tuberculosis Hospital in Ohio from 1936 to 1937, when he was made director of the department of social services. He joined the Chicago Tuberculosis Institute, Feb. 1, 1941.

### INDIANA

**Changes in Health Personnel**—Dr. Arthur Leiter, Columbia City, has been named health officer of Whitley County to succeed Dr. Otto F. C. Lehmberg, Columbia City, who is now a captain in the U. S. Army. Dr. Russell Perry Reynolds has been appointed secretary of the Garrett board of health.

succeeding Dr Robert A Nason, who has entered government service—Dr Sherman T Rogers has been appointed health officer of New Albany to succeed Dr Addis N Robertson, who has resigned—Dr Arthur F Weyerbacher has been appointed to the Indianapolis board of health for a four year term, succeeding Dr George W Kohlstaedt, who recently moved outside the city limits

### KANSAS

**New County Medical Society**—The council of the Kansas Medical Society recently approved the issuance of a charter to the Clark County Medical Society. New officers include Drs Ivan R Buiket, Ashland, president, and Harold O Closson, Ashland, secretary-treasurer

**Election of State Health Board**—At a recent meeting of the Kansas State Board of Health Dr George I Thacher, Waterville, was reelected president and Dr Harry L Aldrich, Caney, vice president. Dr Floyd C Beelman, Topeka, acting secretary, was appointed as the secretary and executive officer and Dr William Fred Mayes, Kansas City, was appointed director of the division of child hygiene. Dr Harry R Ross, Topeka, medical consultant to the board, Drs Forrest L Loveland, Topeka, and Hugh A Hope, Hunter, have been appointed members of the board, succeeding the late Drs James T Reid, Iola, and William C Lathrop, Norton

### KENTUCKY

**Health Officer Goes to West Virginia**—Dr James T Duncan, Columbia, health officer of Adair County since 1937, has resigned to become director of the bureau of tuberculosis of the West Virginia State Department of Health, effective July 1. Dr Duncan graduated at Western Reserve University School of Medicine, Cleveland, in 1933

### MARYLAND

**Dr Knox Named Consultant in Child Hygiene**—Dr James H Mason Knox Jr, Baltimore, who recently retired as director of the state bureau of child hygiene, has been appointed consultant in child hygiene. Dr Knox had been chief of the state bureau since its establishment in 1922. At a recent dinner held to mark his retirement, Dr Knox was presented with a bound portfolio of his own work including reprints of articles, addresses and reports of special studies

### MICHIGAN

**Personal**—Dr Harold B Fenech, Detroit, was appointed chairman of the state crippled children commission, succeeding the late Paul King, Detroit. Other members of the commission are Maurice Aronsson, Detroit, George R Cooke, Detroit, Max Reynolds, Marquette, and Emmet Richards, Alpena

**New Building for State Health Department**—A new building has been erected for the state department of health on the northwest edge of Lansing. The four story construction was financed with state funds of \$135,000, supplemented by WPA grants of labor and materials. Eleven of the twelve bureaus of the state department are located in the new building. Laboratory personnel will continue to occupy the old unit. Ground was broken for the new building in May 1940. It is expected that the official opening will take place within the near future

### MINNESOTA

**Personal**—Dr Edward W Zeman has been named health director of Hibbing, it is reported

**Society News**—Dr Anton J Carlson, Chicago, gave a Mayo Foundation Lecture, July 2, in Rochester on "The Newer Knowledge of Nutrition—How Much of It Is Knowledge?"—Dr Erling W Hansen, Minneapolis, addressed the Minnesota Academy of Medicine, May 13, on "Eye Lesions in Leukemia"

### MISSISSIPPI

**Administrative Changes at Veterans' Facilities**—Dr Ellis P Burns, formerly of Tucson, Ariz, has been assigned chief medical officer at the Veterans Administration Facility, Biloxi, effective July 1, it is reported. He succeeds Dr Ira L Parsons, who is retiring from active service and who has served the facility as chief medical officer since its opening in 1933—Dr Gettis T Sheffield, formerly of Downey, Ill, has been appointed head of the Veterans Administration Facility, Gulfport, succeeding Dr George M Melvin, who was transferred to Roseburg, Ore

### NEBRASKA

**New State Health Officer**—Dr Wallace S Petty, for many years head of the Sioux City and Woodbury County health units, Iowa, has been appointed state health officer of Nebraska. He succeeds Dr Arthur L Miller, Kimball, who resigned to seek the Republican nomination for congress in the fourth district of Nebraska, according to the *Sioux City Journal*, June 1. Dr Petty graduated at Keokuk Medical College of Physicians and Surgeons, Keokuk, Iowa, in 1908. He is 55 years of age. Recently he completed a course of graduate work at the University of Minnesota

### NEW MEXICO

**Society News**—Dr A William Multhaupt, El Paso, Texas, discussed "Management of Stones in the Kidney and Ureter" before a recent meeting of the Chaves County Medical Society in Roswell. The McKinley County Medical Society was addressed recently in Gallup by Dr Ernest A Campbell on methods of skin grafts and their after care

### NEW YORK

**State Maternal Mortality**—The maternal mortality in New York State, exclusive of New York City, was 24 deaths in 1941 per 10,000 live and still births, according to *Health News*, which was 17 per cent less than in the preceding year and 55 per cent below the rate in 1936. Deaths from diseases of pregnancy, childbirth and the puerperium in the state totaled 238. *Health News* points out that, in making comparison between the statistics of mortality in 1940 and in 1941 with those for earlier years, it is necessary to bear in mind the changes made in the last (1938) revision of the International List of Causes of Death. This revision assigns to the puerperal group the mortality from criminal abortion formerly classed under homicide and that from acute yellow atrophy of the liver if associated with pregnancy or childbirth. Since deaths from the latter cause are comparatively few (in 1941 there was only 3 in upstate New York), this new classification has but slight effect on the total rate. Criminal abortions are more numerous, representing 3 to 4 per cent of the maternal mortality, and in comparing the present rates with those of foregoing years it is necessary to make a correction for this factor. The 47 deaths from abortion reported in 1941 were distributed according to circumstances as follows: self induced, 6, adjudged on investigation to have been criminal, 10, therapeutic, 2, spontaneous or unspecified, 29. Of the 47 victims, 12 were single, 2 widowed, 33 married. Among the 191 women who died from other puerperal causes, 12 were single, 1 widowed, 2 divorced and 176 married. Thus, single women accounted for 26 per cent of the deaths from abortion and somewhat more than 6 per cent of the deaths from all other puerperal causes. The leading cause of all maternal deaths is septicemia, which in 1941 was responsible for 42 per cent of the total mortality. In the same year, toxemia accounted for 18 per cent of the deaths. Compared with 1936, the septicemia rate declined 52 per cent and that from toxemia 64 per cent, the rate from all other causes having decreased 55 per cent

### New York City

**Hospital Ship Begins Annual Outings**—The *Lloyd I Scaman*, floating hospital ship of St John's Guild of the City of New York, started, July 1, the sixty-seventh year of the guild's excursions on New York waters for undernourished children up to 12 years and mothers. The vessel carried one thousand children and mothers on the first day of the week end trips. These trips will continue until September 5

**Doctors of Old New York**—The New York Historical Society recently opened a special exhibition called "Doctors of Old New York" to commemorate the two hundredth anniversary of the birth of the New York physician and surgeon Dr Samuel Bard and to honor some of his medical contemporaries. According to the *New York Times*, Dr Bard (1742-1821) was one of the founders of King's College, the first medical school in the city. After retiring he lived at Hyde Park on the estate inherited from his father, which, after passing through many other hands, has now become a national park, the *Times* stated

**Personal**—Dr Fred H Albee will leave Miami, Fla on August 10 via the Pan American Airways on a trip to countries in South America including Brazil, Argentina, Peru and Panama. During his visit Dr Albee will

the operating room of the new Medical College of the University of Buenos Aires, which is to be named after him. Special lectures have been organized before the Brazilian National Orthopaedic Association and the University of Chile, of which Dr Albee is an honorary member.—Dr George T Pack recently received the honorary degree of doctor of laws from the University of Alabama and the degree of doctor of medicine honoris causa from the College of Physicians and Surgeons of the Republic of Costa Rica. Dr Pack recently returned from a lecture tour of Central and South America.

**Changes on Rockefeller Institute Staff**—The board of scientific directors of the Rockefeller Institute for Medical Research announces the following appointments and promotions on the scientific staff, effective on or after July 1. Promotions include associate to associate member, Dr Charles L Hargland, Dr John G Kidd Rebecca C Lancefield Ph D and Dr Joseph E Smadel, assistant to associate, Dr Jordi Folch-Pi Rollin D Hotchkiss, Ph D, and Dr Henry A Schroeder, fellow to assistant, Ralph P Elrod, Ph D, Claude A Knight Jr, Ph D, Thomas Laskaris, Ph D, and Dr R Walter Schlesinger. New appointments include assistants, Francis Binklev, Ph D, Lester Orville Krampitz, Ph D, Cedar Falls Iowa, Dr Raymond Anthony Mezera, St Louis, Mark Arnold Stahlmann, Ph D, Madison, Wis, and Frederick Charles Uhle, Ph D.

**Physician Ordered to Serve Prison Sentence for Insurance Fraud**—Dr Maximilian W Goldstein, who two years ago was convicted of participating in a scheme to defraud insurance companies, must serve his prison sentence, according to a ruling made by Federal Judge Mortimer Byers, reported in the *New York Times* June 24. Dr Goldstein was convicted, with others, on eight counts on charges of mail fraud and conspiracy in a disability insurance fraud. He was convicted under one indictment, but the case was carried to the supreme court, where it was reversed because some investigators had obtained evidence by the unlawful tapping of telephone wires. The *Times* reported. New indictments were obtained to avoid the need of such evidence, it was stated. Under the guidance of the doctors involved in the scheme, the claimants would undergo severe physical exercises and take drugs which upset their normal pulse and other conditions. In this way the claimants were prepared for examinations conducted by honest physicians, who were completely fooled by their apparent symptoms, the *Times* stated. According to the recent report, Dr Goldstein was ordered to surrender on June 29 to start serving his prison sentence of fifteen months. It was reported that he had asked to be placed on probation and permitted to give his medical services in whatever field they might be needed in the war. Judge Myers, who had presided at his trial, rejected the physician's plea, it was stated.

## OHIO

**Physician Celebrates One Hundredth Birthday**—Dr Albert J Marks, Toledo, observed his one hundredth birthday on July 5. According to a newspaper report Dr Marks was born on the high seas of the Atlantic Ocean, July 5, 1842, when his parents were on their way to America from Tool, England. Dr Marks, who practiced medicine in Toledo until he was 92 years old, originally opened his practice in Milbury, it was reported. He graduated at the Physio-Medical Institute Cincinnati, in 1882.

**Special Society Elections**—Dr Frank C Hodges, Huntington W Va, was named president-elect of the Ohio Society of Pathologists recently, and Dr Richard S Austin, Cincinnati, was installed as president. Dr August H Schade, Toledo, is secretary-treasurer.—Dr Ursus V Portmann, Cleveland was elected president during the recent annual meeting of the Ohio State Radiological Society in Columbus. Other officers are Drs Edgar C Baker, Youngstown, vice president, and Justin E McCarthy, Cincinnati secretary-treasurer.

## PENNSYLVANIA

**District Meeting**—The Eleventh Councilor District of the Medical Society of the State of Pennsylvania, comprising Bedford, Cambria, Fayette Greene, Somerset and Washington counties was addressed, July 16, in Somerset by Drs John S McMurray, Washington, on "Neoplasma of the Upper Respiratory Tract", Horace B Anderson, Johnstown, "Plasma Banks", Edwin P Buchanan, Pittsburgh "Responsibility for Early Diagnosis of Cancer—Special Consideration of Cancer of the Breast," and James L Blaisdell, London Ont Canada,

"Further Studies in Silicosis with Reference to Aluminum Therapy." Fifty year testimonial certificates were presented by Dr Walter F Donaldson, Pittsburgh, secretary of the state medical society, to Drs Harry J Bell, Dawson, and Jesse F Cogan, Dawson.

## Philadelphia

**Dr Packard Receives Newcomb Award**—The American Laryngological Association bestowed its Newcomb Award on Dr Francis R Packard, formerly professor of otology of the Postgraduate School of the University of Pennsylvania, "for scientific attainment in rhinology and laryngology and as a mark of esteem and appreciation for services to the association." Dr Packard was president of the American Laryngological Association in 1931.

## Pittsburgh

**Society News**—The Pittsburgh Surgical Society was addressed, May 15, by Drs Jonathan E Rhoads and John S Lockwood, Philadelphia on "Management of Burns" and "Use of the Sulfonamides in Treatment and Prevention of Infections," respectively.

## WASHINGTON

**State Medical Meeting Canceled**—The fifty-third annual meeting of the Washington State Medical Association scheduled for Spokane, August 17-19, has been canceled by action of the board of trustees. The board and house of delegates will meet, however, at the Olympic Hotel, Seattle, September 12-13, to conduct the official business of the association.

**Personal**—Dr Emil E Palmquist, Port Angeles, health officer of Clallam County-City Health Unit, was elected president of the Washington State Public Health Association at its recent annual meeting, succeeding Dr Arthur L Ringle Kelso.—Dr Frederic G Sprowl, Spokane, has been appointed a member of the medical examining committee to succeed Dr Donald G Corbett, Spokane.—Dr Jacob Kasanin, San Francisco, is conducting two courses in social psychiatry during the summer session of the University of Washington, Seattle.

## WISCONSIN

**State Medical Meeting**—The one hundred and first annual meeting of the State Medical Society of Wisconsin will be held at the Hotel Schroeder and the Milwaukee Auditorium in Milwaukee, September 14-16. Included among the speakers participating in the general sessions, round table discussions, symposiums and sectional meetings will be

- Dr Arlie R Barnes Rochester Minn Diagnosis of Pathologic Conditions of the Heart
- Dr Stuart W Harrington Rochester Constructing Pericarditis
- Dr Wesley W Spink Minneapolis The Clinical Applications and Complications of the Sulfonamides
- Dr Clayton G Loosi Chicago Pneumonia and Chemotherapy
- Dr Edgar A Hines Jr Rochester Normal Range and Hereditary Factors in Hypertension
- Drs Eliequis T Bell Minneapolis and Irvine H Page Indianapolis titles to be announced later
- Dr Edward H Rynearson Rochester Actual Clinical Disturbances of the Endocrine Glands
- Dr Tom D Spies Cincinnati Advances in Vitamin Therapy
- Dr Julius Jensen St Louis Modern Concepts of the Relation Between Heart Disease and Pregnancy
- Dr Howard P Douth Detroit The Roentgenographic Changes in Virus Pneumonia
- Dr James W White New York Diagnosis in Diseases of Eye Muscles
- Dr Ralph H Woods La Salle Ill Frequent Causes of Eye Discomfort
- Dr Wallace H Cole St Paul The Kenny Treatment of Anterior Poliomyelitis
- Dr Maurice L Blatt Chicago Control of Contagion in Childhood
- Dr Bert I Beverly Chicago Emotional States and Management Problems in Childhood
- Dr Hülger P Jenkins Chicago Problems in the Selection Preparation and Use of Suture Material in General Surgery
- Dr Herman O McPheeters Minneapolis The Present Day Treatment of Varicose Veins
- Dr Winfield W Scott Chicago Castration Treatment of Carcinoma of the Prostate
- Dr Thomas L Pool Rochester The Treatment of Urinary Tract Infections with the Sulfonamide Group of Drugs
- Dr Oliver E Van Aylse Chicago Nasal Accessory Sinuses
- Dr George E Shambaugh Jr, Chicago Allergy in Office Eye Ear and Throat Practice
- Lieut Col William C Porter M C U S Army Washington D C, Theresa Rogers Memorial Lecture—War and Neuropsychiatry
- Dr George M Curtis Columbus Ohio Blast Injuries
- Dr Warren H Cole Chicago The Treatment of Civilian War Injuries
- Dr George P Guibor Chicago The Practical Use of Prisms

The woman's auxiliary will join the physicians at the annual dinner, Tuesday, September 15, to be addressed by Dr Fred W Rankin, Lexington, Ky, President of the American Medical Association. The annual smoker of the society will be held at the Hotel Schroeder, Monday, September 14. This year the society will hold a physicians hobby show under the supervision of Dr Clyde J Smiles, Ashland.

## GENERAL

**Institute for Hospital Administrators**—The tenth institute for hospital administrators of the American Hospital Association will be held at International House, University of Chicago, September 14-26. The program will include lectures, seminars and group conferences covering various aspects of hospital management. All communications concerning the institute should be addressed to Miss Agnes M. McCann, secretary of the Institute for Hospital Administrators American Hospital Association, 18 East Division Street, Chicago.

**Clinics**—The editors and publisher of the *New International Clinics*, in response to the increased tempo of medical progress, have started a new publication called *Clinics*, which will be issued bimonthly instead of quarterly, as was the older publication, the *New International Clinics*. A symposium is planned for each number for the issues ahead covering such topics as transfusion and blood substitutes, hemorrhage, nutrition, neurosurgery, endocrinology, industrial hygiene, arthritis and rheumatism, obstetrics and gynecology, pediatrics, differential diagnosis and social psychiatry. The new periodical will be edited by Dr. George Morris Piersol, professor of medicine, Graduate School of Medicine, University of Pennsylvania, with the collaboration of a group of distinguished physicians from various medical centers, and the publisher will continue to be the J. B. Lippincott Company, Philadelphia. The first issue of the first volume of *Clinics* was published in June.

**Mr. Cameron Retires as Managing Director of Safety Council**—Mr. William H. Cameron, Chicago, for almost thirty years managing director of the National Safety Council, has retired. He will be succeeded by Ned H. Dearborn, Ph.D., New York, who has been named executive vice president and managing director. Mr. Dearborn has been dean of the division of general education of New York University since 1934. In his new position he will actively direct and expand the wartime program now being conducted by the National Safety Council as a result of a proclamation by President Roosevelt. The necessary funds for this program, aimed at stopping accidents that are impeding production, are now being obtained from commerce and industry by the Council's War Production Fund to Conserve Manpower. According to an official release, an initial appropriation of \$250,000 from this fund will be made available to the council for immediate development of this wartime safety program. An additional \$1,000,000 already pledged will be allocated within the next few months. Mr. Dearborn has been engaged in accident prevention for several years and was responsible for the development four years ago of the Center for Safety Education at New York University. He has been vice president for education of the National Safety Council for two years and for the last year has been chairman of the council's special finance support committee. Mr. Cameron became managing director of the National Safety Council when it was formed in 1913. Prior to that he had been manager of the casualty and safety departments of the American Steel Foundries in Chicago.

**Special Society Elections**—Dr. Hermon M. Taylor, Jacksonville, Fla., was named president-elect of the American Laryngological, Rhinological and Otolological Society at its meeting in Atlantic City, June 3, and Dr. James G. Dwyer, New York, was installed as president. Dr. Carlton Stewart Nash, Rochester, N. Y., was reelected secretary. Dr. Walter S. Thomas of Rochester, N. Y., was chosen president-elect of the American Society of Clinical Pathologists at its annual meeting, held in Philadelphia in June. Dr. Harry Goldblatt, Cleveland, was installed as president and Dr. John T. Bauer, Philadelphia, was named vice president. Dr. Alfred S. Giordano, South Bend, Ind., was reelected secretary. The gold medal for excellence in scientific exhibit was awarded to Drs. Philip Levine, Newark, N. J., Peter Vogel, New York, and Eugene M. Katzin, Newark, for their exhibit on "Isoimmunization, Rh Blood Factor and Erythroblastosis Fetalis." Dr. Byrl R. Kirklin, Rochester, Minn., was elected president of the American College of Radiology at its annual meeting in Atlantic City, June 10. Dr. Eugene P. Pendergrass, Philadelphia, was named vice president and Dr. Hollis E. Potter, Chicago, was reelected treasurer. Mac F. Cahal, Chicago, is the executive secretary. The next annual meeting will be in San Francisco. The board of chancellors of the college and teachers of clinical radiology will hold their annual congress in Chicago in February 1943. Dr. Karl D. Figley, Toledo, Ohio, was chosen president-elect of the Association for the Study of Allergy at its annual meeting and Dr. Samuel M. Feinberg, Chicago, was inducted into the presidency. Dr. Oscar Swineford Jr., Charlottesville, Va., is vice president and Dr. Harvey Black, Dallas, is the secretary-treasurer. Dr. Homer I. Silvers, Atlantic City,

N. J., was elected president of the American Proctologic Society at its annual meeting recently and Dr. William H. Daniel, Los Angeles, was reelected secretary. The American Diabetes Association announced that its officers for the ensuing year are Drs. Joseph T. Beardwood Jr., Philadelphia, president, Joseph H. Barach, Pittsburgh, and Russell M. Wilder, Rochester, Minn., vice presidents, Cecil Striker, Cincinnati, and William Muhlberg, Cincinnati, treasurer. Helen Revel is acting executive secretary.

## LATIN AMERICA

**Personal**—Dr. Alvaro E. Bence, Buenos Aires, Argentina, was elected a corresponding member of the American Bronchoesophagological Association at its annual meeting in Atlantic City, June 9.

**New Committee on Tuberculosis**—A national committee was recently organized in Argentina for the government campaign against tuberculosis, with headquarters in Buenos Aires, according to the *Bulletin* of the National Tuberculosis Association. Drs. Alejandro A. Ramondi and Rodolfo A. Vaccarezza, University of Buenos Aires Faculty of Medicine, were appointed president and secretary, respectively.

## FOREIGN

**Sir Henry Dale to Retire as Director of National Institute**—Sir Henry H. Dale, president of the Royal Society, will retire as director of the National Institute for Medical Research, Hampstead, on September 30, according to *Science*. He will be succeeded by Charles R. Harington, Ph.D., professor of pathologic chemistry, University of London, and director of the Graham Medical Research Laboratories of University College Hospital Medical School.

**Public Health Under Hitler's Rule**—Transocean of May 22 reports that 1,100 sick and wounded Belgian prisoners of war arrived in Antwerp May 21 in special trains from Germany. Except those who were able to return to their families, the men were placed in hospitals.

The reich minister of labor has decreed, according to NDZ of May 23, that, for the duration of the war, national health insurance institutes must defray the cost of remedying the sterility of women as part of their assistance to the family, even if they exceed the statutory benefits granted by health insurance institutes.

The *Donauzeitung*, Belgrade, of May 5 reports that, according to a recent announcement, all families with more than five members and all the poor in Athens and the Piraeus will receive free medical attention.

A public meeting was held at Lahti in May, according to *Suomen Sosialidemokraatti*, Helsinki, of May 10 to discuss the increase in venereal disease and drunkenness in Lahti. Venereal disease was said to be spreading at an alarming rate, it was suggested at the meeting that the city build a clinic for venereal diseases.

A report submitted to the Styrian Medical Society, according to the *Munchener medizinische Wochenschrift* of May 8, stated that susceptibility to spotted typhus is the same for men as it is for women. Every case and every suspected case must be reported. Only persons who have been cured of spotted typhus or who have been vaccinated against the disease should work at delousing stations. Only single cases thus far have reached Styria. According to the *Deutsche Zeitung* of May 7, the report of the Budapest medical officer for April stated that "in connection with typhus (bauchtyphus) 1,338 persons were examined by the Institute of Public Health, and 29 in connection with spotted typhus (flecktyphus)." At a meeting at Thisted, according to *Amts Avis* of May 6, Dr. Folke, the district physician, said that lice were more widespread than was expected. A hundred school children at Thisted had head lice; twenty-five had body lice and about fifty adults had body lice. The "lice plague" has also increased lately in such country districts as Thy and Mors.

An advanced training course for works doctors has begun in Vienna, according to a Luxembourg broadcast of May 11. The course, which was arranged by the academy for advanced medical training and the DAF, was opened in the presence of the gauleiter of Niederdonau.

## CORRECTION

**Treatment of Yellow Fever**—In the article by Dr. Fred L. Soper in *THE JOURNAL*, January 31, the sentence in lines 4-6 in the paragraph numbered 4 under "Clinical Picture" on page 376 should have read: "The classic attack may be mild or the hemorrhage does not become excessive and the kidneys continue to secrete."

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

June 27, 1942

#### More Doctors Wanted for the Fighting Forces

Though a large part of the younger members of the medical profession has been called up for service with the fighting forces the minister of health, Mr. Ernest Brown addressing a meeting of local medical war committees, stated that the exigencies of the military situation now required an acceleration of the withdrawal of civilian practitioners for war purposes. This could not be done without special arrangements. It would be necessary to curtail the period during which newly qualified practitioners were allowed to remain in hospital appointments. Their place would have to be taken by women practitioners and by male practitioners who were not liable for service with the fighting forces on the ground of age, nationality or medical fitness. Larger hospitals were to be urged to undertake specialist work for smaller hospitals and so release for the fighting forces specialists at present retained in the latter. It would be necessary for part time medical officers of hospitals to undertake a greater share of the work so as to reduce the number of whole time staff and thereby release them for the same end. There was scope for economies in the staffs of medical schools and research establishments and the possibilities were being explored with the appropriate authorities. Finally a scheme was under consideration with the object of making the most economical use of medical manpower by eliminating overlapping in the work of general practitioners.

Lieutenant General Hood, director general of the army medical services, described how medical establishments in the army were kept down to the absolute minimum compatible with efficiency and were constantly under review in the light of experience gained from all theaters of war. He gave examples of how it had been found possible to economize in personnel by replacing medical officers by nonmedical ones in certain units. He informed the meeting that a committee consisting of doctors experienced in army administration and of business men experienced in army medical administration had carried out a special investigation into medical documentation in order to cut this down to a minimum which would contribute to economy in medical officers. The amount of time that has to be spent in filling out forms is a well known complaint of army medical officers. General Hood emphasized the importance of preventive medicine in the army. The primary duty of the medical officer was to keep the largest number of fit men at the disposal of the commander. He was confident that the men in the field would have the most efficient medical service this country could produce and that, if further demands were made on the civil profession they would respond to their maximum effort.

#### Economy in the Use of Quinine

Though supplies of quinine are declared by the government to be adequate for a considerable time, economy is necessary. In a communication to the *Lancet* W. D. Nicol and P. G. Shute of the Malaria Laboratory of the Ministry of Health point out that it is not generally recognized that the amount of quinine necessary to cure an attack of malaria varies according to the parasite. As a result of twenty years' experience they give the following advice. In *Plasmodium vivax* infections a single dose of 5 grains (0.3 Gm.) of quinine once a day for fifteen days will cure. Larger daily doses even if extended over a longer period, do not prevent relapses no matter how often the patient has been bitten by infected mosquitoes. In relapses an even smaller daily dose for a few days is sufficient.

Infections with *Plasmodium falciparum* require a larger dose, 10 grains (0.65 Gm.) daily for ten days. Long delayed relapses or latency are not seen in malignant tertian malaria.

The problem of mixed infections is rather different, but in the writer's experience 10 grains daily for ten days is adequate. The so called anti-relapse treatment is useless. To give 10, 20 or even 30 grains once a week in the hope of preventing a relapse in the future does nothing but make the patient feel uncomfortable.

These remarks apply only to persons returning to this country after having suffered from malaria in an endemic area. To conserve quinine it should not be given until a relapse occurs, and then only when the diagnosis has been confirmed by blood examination. A patient returning to this country may never relapse and even if he does in the case of *Plasmodium vivax* it may not be for six months or a year after his last attack.

#### A Shorter Medical Curriculum

The shortage of doctors resulting from the number required for the fighting services has caused the minister of health to make a recommendation to the General Medical Council that the period of medical study be shortened as an emergency measure. The council has decided not to stand in the way of any licensing body which cares to shorten the period of medical study following the examinations in anatomy and physiology, provided that at least thirty months are allowed between these examinations and the final examination and that the standard is not lowered. At the present time the minimum period is three years. This would mean a shortening by six months of the period of clinical study—a thing to be regretted, but no doubt the lesser of two evils under the circumstances.

#### Flying Doctors for the Air Force

"Flying doctors"—medical officers fully trained in most cases for operational duties as pilots—are being introduced into the fighting services. In the fleet air arm and the air force the scheme has been adopted to enable the closest possible study to be made of flying strain and other diseases peculiar to airmen. In the army air corps it is intended that medical officers shall accompany glider troops into action where necessary. An increasing number of naval surgeons will soon be wearing wings. In most cases they will be posted to aircraft carriers.

#### A Physician Who Sacrificed Himself for the Benefit of Lepers

At the annual meeting of the British Empire Relief Association it was stated that as great an interest is being displayed in the problem of leprosy in the empire as at any previous time. Even from the colonies now in Japanese control comes news of inspiring devotion to duty. Dr. G. A. Rylie, head of the great leper settlement at Sungai Buloh established by the government of the Federated Malay States has refused to be evacuated and remained to care for his lepers when the territory was overrun by the Japanese. The chairman of the executive committee of the association, Sir William Peel, said that the settlement was one of the finest of its kind in the world. Dr. Rylie had been reported to be a prisoner, but it was now understood that the Japanese had requested him to carry on his good work and that he was doing so.

#### Children Killed by Undetected Bomb

A violent explosion in the Southwark district of London killed nineteen persons and injured fifty-nine. Five three story buildings were completely wrecked and a crater 20 feet deep was produced. It is believed that the bomb was dropped in an air raid and lodged in a cellar where it remained undetected. The dead included six little children five of whom had been playing cricket in the street and the sixth riding a bicycle. The last big air raid on London was on May 10, 1941 when bombs

were dropped on the area where the explosion took place. Why the bomb should have remained quiescent for over a year has not been explained.

### Improved Health During the War

Latest figures for the chief notifiable infectious diseases to April 11 are lower than in the corresponding periods of previous years. The deaths from influenza in the returns for the one hundred and twenty-six large cities number so far this year 933, compared with 2,340, 4,745 and 3,094 in the corresponding periods of 1941, 1940 and 1939. The fall in infant mortality has been checked, but in the second year of the war it was only 56 per thousand live births, as compared with 110 in the second year of the last war. The fall in maternal mortality has continued and the figure of 261 per thousand births in 1940 was the lowest on record. This is ascribed partly to advances in the treatment of sepsis and partly to the improved standard of domiciliary midwifery. A war measure was the setting up by the end of 1941 of one hundred and seventeen emergency maternity homes for women evacuated from areas in danger of air attack. Near these homes, antepartum and postpartum hostels were established to accommodate the women before and after labor.

There are two exceptions to the general improvement in health during the war. The first is cerebrospinal fever, which is specifically a wartime disease. The number of cases rose from 1,500 in 1939 to 12,771 in 1940, but the mortality was low. Another exception to the general improvement in health is an increase in the number of cases of pulmonary tuberculosis in young women. This also was observed in the last war.

### THE EMERGENCY MEDICAL SERVICE

The war emergency service has been an important factor in the public health. By March 1941 80 per cent of the hospitals were embraced in this scheme. At first it was for civilian air raid casualties and military sick and casualties for which the army could not find beds. Later it undertook civil defense workers and others suffering from injuries sustained in war service. One result of the new system has been increased specialization. The former conception of a general hospital which undertakes everything has given way to hospitals which specialize in one thing or another. Over seventy special treatment centers are attached to the emergency hospitals, and patients are transferred to them as soon as the need for special treatment arises. This includes orthopedic and fracture surgery, maxillofacial, thoracic and neurosurgery, and treatment for burns, effort syndrome and cutaneous diseases.

### The Medical Research Institute

Sir Henry Dale, president of the Royal Society, will on September 30 retire from the post of director of the National Institute for Medical Research. To succeed him the Medical Research Council has appointed Prof C R Harrington, FRS, professor of chemical pathology in the University of London and director of the Graham Research Laboratories in University College Medical School.

### No Tea for Children Under Five Years of Age

As stated in previous letters, every one can get enough food for maintenance of health but is limited in choice by rationing. The minister of food announces that he is advised that tea is not good for young children, for whom special provision is made in priority supplies of milk, eggs, oranges and cod liver oil. He has therefore decided that the weekly tea ration of 2 ounces will no longer be allowed for children under 5. The United States is supplying sufficient concentrated orange juice to meet the special allocation to infants up to the age of 2 years.

### Precautions Against Air Attacks

Queen Mary's Hospital at Roehampton (in the outskirts of London) has since the last war been the great center for artificial limb fitting. Of the 41,000 men who lost limbs in that war 26,000 were fitted for their artificial limbs at Roehampton. In the present war 1,123 persons, whether civilians or members of the fighting forces, who underwent amputation as the result of enemy action have been fitted there. In a ceremony presided over by the minister of pensions, Lord Horder opened underground extensions which have been made as a protection against air attacks. These include an underground operating room with a roof of reinforced concrete, especially strong traverses, an air conditioning plant, two emergency lighting schemes and provision, in the event of a gas attack, for air to be drawn through charcoal filters both to the operating room and to the wards above. There is also a resuscitation ward to which casualties are first taken and where every bed has its own set of pipes and masks for oxygen administration.

### The Employment of the Tuberculous

In peacetime, work for the tuberculous after discharge from a sanatorium is a difficult problem. They usually are unable to work full time. In attempting to provide for his family a man may start a relapse. Attempts have been made to solve the difficulty by village settlements, where patients discharged from sanatoriums have work suitable for their condition provided, but so far provision has been made for only a fraction of the cases. The problem was discussed at a recent meeting of the Tuberculosis Association, and a committee was appointed to report. It divided the tuberculous discharged from a sanatorium into three classes: (1) those with positive sputum who cannot work, (2) those with positive sputum who can do some work and (3) those with negative sputum who are employable. The committee considers that the third group may undertake half time work in ordinary factory shops or part time work in groups in special sections of factories. Thus there would be a period of sheltered employment before returning to full time work. At present, because of the increased demand for labor due to the war, there is little difficulty in providing part time work. But payment on an hourly basis will not maintain a healthy standard of living. Therefore wages must be subsidized by some outside agency. Local authorities have power in this direction through their public assistance committees, but these are imperfectly understood and so far have been little used. Actually they do subsidize the wages of their patients working in village settlements. Patients in the second group might be provided with work at the larger sanatoriums. The committee recommends simple light industries not requiring complicated machinery or power.

## Marriages

GERALD EDWARD KINZEL, Portland, Ore., to Miss Gladys Le Count Darling of Waycross, Ga., recently.

DAVID PENDLETON WINKLER, Los Angeles, to Miss Elizabeth Babcock in Atlanta, Ga., recently.

JOHN HARTWELL DUNN, Heavener, Okla., to Miss Gladys Edna Moody of Drew, Miss., in May.

ALEXANDER CHARLES COHEN, Philadelphia, to Missillian Becker of Newark, N. J., May 31.

PHILIP EDWARD ASSEY to Miss Josephine Frances Lee, both of Georgetown, S. C., May 24.

JOHN CHAMPNEYS TAYLOR, Jacksonville, Fla., to Miss Evelyn Rose of Chicago in May.

EDWIN E. MILLER, Knoxville, Tenn., to Miss Clara C. Rosenfield of Jellico in May.

MILTON D. HYMAN to Dr. SEMMA SHAPIRO, both of New York, May 7.

## Deaths

**Robert Emmett Buckley**, New York, Yale University School of Medicine New Haven, Conn. 1911 member of the Medical Society of the State of New York, the American Academy of Ophthalmology and Otolaryngology, the American Laryngological Association and the American Rhinological, Rhinological and Otolaryngological Society, specialist certified by the American Board of Otolaryngology, at one time assistant professor of laryngology and professor of clinical otolaryngology at the New York Post-Graduate Medical School, Columbia University served with the Roosevelt Hospital unit in France during World War I, consultant to St. Luke's Hospital, Newburgh, N. Y., and the Yonkers (N. Y.) Professional Hospital, surgeon director of laryngology at the Manhattan Eye, Ear and Throat Hospital, consulting laryngologist to the Misericordia Hospital and consulting otolaryngologist to the Roosevelt Hospital, where he died, July 25, following an operation carcinoma of the colon, aged 53.

**John B. Alcorn** of Columbus, Ohio, University of Louisville (Ky.) Medical Department, 1894 member of the House of Delegates of the American Medical Association in 1938, 1940, 1941 and 1942, emeritus assistant professor of ophthalmology at the Ohio State University College of Medicine, past president of the Ohio State Medical Association and of the Columbus Academy of Medicine, past president and secretary of the Gallia County Medical Society, veteran of the Spanish-American War, served on the Mexican border in 1917 and as a captain in the Ohio National Guard, at one time health officer of Gallipolis and president of the school board, formerly chairman of the staff of the Grant and University hospitals and a member of the staff of St. Francis Hospital, at one time physician for the Ohio State Penitentiary, aged 69, died, June 16, of injuries received when struck by a trolley bus.

**Winfield Carey Sweet**, New York, Rush Medical College, Chicago, 1917, served in the medical corps of the U. S. Army during World War I, after a period of service with the American Red Cross in Siberia, went to the Christian Hospital at Shoa-hsing Chekiang Province, China, as a surgeon, began his service with the International Health Board of the Rockefeller Foundation on Nov. 10, 1921, was director of hookworm campaigns for the foundation in Australia and in Ceylon, formerly consultant in health for the government of Bangalore, Mysore, India, received the degree of doctor of public health from Johns Hopkins University School of Hygiene and Public Health, Baltimore, in 1931, aged 50, died, May 20, in Cochabamba, Bolivia, of heart disease.

**William McCully James** of Panama, Republic of Panama, University of Virginia Department of Medicine, Charlottesville, 1906, member and in 1913 president of the Medical Association of the Isthmian Canal Zone, fellow and a former governor of the American College of Physicians, served as a major in the medical corps of the U. S. Army during World War I, specialist certified by the American Board of Internal Medicine, chief of the medical service of the Panama Hospital and the Herrick Clinic which he helped to establish, in 1927 was awarded the bronze medal by the American Medical Association and in 1934 a gold medal for his exhibits on amebiasis, aged 62, died, July 10, of cerebral hemorrhage.

**Clarence Manning Grigsby** of Dallas, Texas, College of Physicians and Surgeons, Baltimore, 1893, associate professor of medicine, 1911-1912, professor of medicine from 1912 to 1929, professor of clinical medicine from 1929 to 1941 and since then emeritus professor of medicine at the Baylor University College of Medicine, specialist certified by the American Board of Internal Medicine, fellow of the American College of Physicians, past president of the Dallas County Medical Society, aged 73, formerly physician in chief at the Baylor Hospital where he died, June 14, of hypertensive heart disease and angina pectoris.

**Warren Conrad Breidenbach** of Dayton, Ohio, University of Michigan Medical School, Ann Arbor, 1917, specialist certified by the American Board of Internal Medicine, member of the American College of Chest Physicians, fellow of the American College of Physicians, formerly member of the Ohio Public Health Council, since 1919 medical director of the Stillwater Sanatorium, on the staffs of the Miami Valley and Good Samaritan hospitals, consultant for the Ohio Soldiers and Sailors' Orphans Home Hospital, Xenia, aged 48, died, June 30, of heart disease.

**Edwin Hogerbets Coward** of Atlantic City, N. J., Jefferson Medical College of Philadelphia, 1913, health officer of Atlantic City from 1915 to 1918, director of the county welfare board, was associated with the state department of health as a member of the examining board for health officers and sanitary inspectors for food, drugs, milk and the like, member of the Selective Service System of Atlantic County, medical director and superintendent of the Atlantic County Almshouse Hospital, Northfield, aged 56, died, June 10, of coronary thrombosis.

**William H. Wilson**, Ponca City, Okla., College of Physicians and Surgeons of Chicago, 1884, member of the Nebraska State Medical Association, formerly associated with the U. S. Public Health Service, at one time chief of the bureau of health, Nebraska State Department of Health and Public Welfare at Lincoln, state health inspector from 1907 to 1915 and state epidemiologist from 1918 to 1921, represented Pawnee County, Neb., in the legislature in 1903 and 1905 and was senator from the first district in 1907, aged 86, died recently.

**Henry Williamson Hoagland**, Palm Springs, Calif., University of Pennsylvania Department of Medicine, Philadelphia, 1899, at one time assistant professor of medicine (tuberculosis) at the College of Medical Evangelists, Los Angeles, member of the American Chemical and Climatological Association, served as a colonel in the medical corps of the U. S. Army during World War I, formerly secretary of the U. S. Pension Board, aged 68, died, May 7, in La Jolla of coronary thrombosis, coronary sclerosis and arterial hypertension.

**William Fowler** of Detroit, Michigan College of Medicine and Surgery, Detroit, 1903, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology, past president of the Detroit Otolaryngological Society, fellow of the American College of Surgeons, on the staff of the Grace Hospital, a frequent contributor of poems and other original items in *Tonics and Sedatives* under the name of "Weehum", aged 76, died, July 13, of carcinoma.

**Eugene Thames**, Mobile, Ala., University of Alabama School of Medicine, 1910, member of the Medical Association of the State of Alabama, formerly instructor of biology and for many years physician at the Springhill College, served as a first lieutenant with the American Expeditionary Forces during World War I, at one time member of the county board of health, for many years on the staff and at one time secretary of the Providence Hospital, aged 53, died, June 8, of cardiovascular renal disease.

**Fielding Lewis Taylor** of New York, University of Virginia Department of Medicine, Charlottesville, 1891, formerly associate in clinical medicine (dermatology) at the Cornell University Medical College, formerly on the staff of the City Hospital and the Hudson Street Hospital, for many years consulting syphilologist to the New York Hospital, aged 74, died, June 22, of coronary thrombosis.

**Conrad De Jong**, Grand Rapids, Mich., State University of Iowa College of Medicine, Iowa City, 1897, formerly on the staffs of the Blodgett Memorial, Butterworth and St. Mary's hospitals, aged 70, died, June 13, in the Holland City Hospital, Holland, of pneumococcus type 11 pneumonia complicating cerebral hemiplegia.

**Charles Stephen Buchanan**, Bennington, Vt., University of Vermont College of Medicine, Burlington, 1904, member of the Vermont State Medical Society, past president of the Bennington County Medical Society, aged 70, on the staff of the Putnam Memorial Hospital, where he died, June 6, of cerebral arteriosclerosis.

**Stephen Joseph Wojcik** of Los Angeles, Loyola University School of Medicine, Chicago, 1934, member of the Illinois State Medical Society, aged 40, died, May 20, in the Veterans Administration Facility of coronary occlusion due to coronary sclerosis.

## KILLED IN ACTION

**Allen Jones Jervey Jr.**, Tryon, N. C., Medical College of the State of South Carolina, Charleston, 1939, was appointed a first lieutenant in the medical reserve corps of the U. S. Army March 1, 1941, formerly district health officer for Rutherford and Polk counties, aged 30, died somewhere in the Pacific, June 17, of gunshot wounds.

**Bureau of Investigation****MISBRANDED PRODUCTS****Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the Federal Security Agency**

[EDITORIAL NOTE—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods, F N J. The abstracts that follow are given in the briefest possible form: (1) the name of the product, (2) the name of the manufacturer, shipper or consigner, (3) the date of shipment, (4) the composition, (5) the type of nostrum, (6) the reason for the charge of misbranding and (7) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

**Axine Plates**—W Gordon Pervis, Tennille, Ga. Shipped Sept 30, 1939. Composition: two plates made of copper and zinc respectively, to be worn in the shoes. Falsely represented to produce health and vigor by means of electricity in the human body, rid the blood of uric acid, prevent high or low blood pressure, asthma, paralysis, diabetes, eczema, rheumatism, kidney disorders and some other things—[D D N J, F D C 217, April 1941]

**Chlorotonic**—Pharmaceutical Products Company, Easton Md. Shipped Jan 30, 1939. Composition: 0.145 grain of arsenic chloride per fluid ounce. Misbranded because among other things, falsely represented on the label as an alternative in treating latent syphilis, a stimulant to the glandular system and an effective treatment of anemia—[D D N J, F D C 168, April 1941]

**Colloidal Dextro Calcium**—Bleything Laboratories, Denver. Shipped Oct 17, 1940. Misbranded because label gave false impression that product would supply the user with a significant amount of calcium even in pronounced cases of calcium deficiency whereas it would supply only a negligible amount of this mineral, further misbranded because it contained more than the 1/20 of 1 per cent of sodium benzoate that the label declared—[F N J, F D C 2098, February 1942]

**Elixir Saligen**—G D Searle & Company, Chicago. Shipped July 29, 1939. Composition: though labels declared 4 grains of potassium iodide per fluid ounce, some bottles contained as much as 7.6 grains of this ingredient and others, none, hence adulterated. Misbranded because label statement "Each fluid ounce represents potassium iodide 4 grains" was false and misleading. Use not reported—[D D N J, F D C 290, November 1941]

**Germ-I Tabs**—Esteys, Inc., Seattle. Shipped Jan 3, 1940. Composition: tablets containing starch and 22.4 per cent of sodium para-toluenesulfonchloramide (chloramine T). Bacteriological tests showed that it was not, as represented, an antiseptic or germicide in the dilutions recommended. Misbranded because represented on label as a general germicide, antiseptic and personal deodorant and a remedy for acne—[D D N J, F D C 215, April 1941]

**Hannon's Rub**—Hannon's Medicines, Inc., Brookhaven, Miss. Shipped April 29, 1940. Composition: a two-layer liquid consisting essentially of camphor, soap, chloroform water and alcohol. Falsely represented to be a remedy for many disorders, including arthritis, croup, menstrual colic, sciatica and paroxysms due to asthma—[D D N J, F D C 222, April 1941 and D D N J, F D C 371, March 1942]

**Healo Salve**—Ericka Company, Springfield, Mass. Shipped Feb 8, 1940. Composition: essentially petrolatum and volatile oils including peppermint, thymol, camphor and eucalyptol. Misbranded because label representations that it was a remedy for neuralgia, catarrh, pneumonia, asthma, hay fever, eczema and some other things were false and misleading—[D D N J, F D C 221, April 1941]

**H & H Foot Exercisers**—Hussmann Holmes Company, El Paso, Texas. Shipped April 29, 1940. This consisted of a wooden roller. Falsely represented as efficacious in the treatment of weak arches, flat feet, metatarsal trouble, burning calluses, 'chronic leg muscle' and a good many other disorders—[D D N J, F D C 218, April 1941]

**Koenig's Nervine**—Koenig Medicine Company, Chicago. Shipped Feb 15, 1940. Composition: sodium potassium and ammonium bromides, extracts of plant material (including valerian), glycerin, alcohol and benzoic acid. Misbranded because labels falsely represented it as a proper sedative in headache, common nervousness, sleeplessness and allied conditions—[D D N J, F D C 142, April 1941]

**L B Hair Oil**—L B Laboratories, Inc., Hollywood, Calif. Shipped Sept 18, 1939. Composition: essentially mineral oil with small amounts of saponifiable oil and perfume. Misbranded because label falsely represented, among other things, that it was a "scalp conditioner" containing a balanced blend of rich animal oils and toning ingredients which would give life to the hair almost instantly, that it would aid in overcoming baldness, thin and falling hair, that it contained animal oils of a very penetrating nature, that it was an "oil of life" for the hair and had cured baldness in its originator, that it was a blend of animal oils which would provide the vitalizing, nourishing and restorative element needed

by the scalp to clear out clogging waste matter and dead tissue, and that it was effective for infant scalp trouble, granulated eyelids, thinning lashes and sunburns or other burns—[D D N J, F D C 296, November 1941 and C N J, F D C 34, May 1941]

**Mastercraft Two Speed Electric Vibrator**—Vidrio Products Corporation, Chicago. Shipped between Dec 10 and 22, 1939. A device with various attachments intended to apply mechanical vibration to the body. Falsely represented on the label as efficacious for indigestion, constipation, baldness, neuralgia, head colds, sciatica pains, eyestrain, sleeplessness, obesity and some other conditions—[D D N J, F D C 202, April 1941]

**Nuval Aid**—V M Products, Chicago. Shipped Sept 18, 1940. Composition: sugar coated yeast tablets each containing not more than 36 U S P units of vitamin B<sub>1</sub>, which was only three-fourths of the amount declared on the label. Adulterated because a valuable constituent, vitamin B<sub>1</sub>, had been in whole or in part omitted or extracted and because the product's strength differed from, and its quality fell below what it was represented to possess. Misbranded because of false label claim "Each tablet contains not less than 48 International units of Vitamin B<sub>1</sub>"—[D D N J, F D C 285, November 1941]

**Parker's Hair Balsam**—Hiscox Chemical Works, Patchogue, N Y. Shipped between Aug 26, 1939 and Jan 27, 1940. Composition: lead acetate, sulfur, water, glycerin and perfume. Misbranded because label represented, among other things, that it would stop falling hair and prevent premature grayness—[D D N J, F D C 216, April 1941]

**Premek 33**—H K Patch Company, Los Angeles. Shipped between Sept 25 and Nov 13, 1939. Composition: essentially sulfur, magnesium hydroxide, water and a small amount of a phenolic product. Misbranded because falsely represented that it would remedy many skin disorders and destroy parasites and fungus spores by releasing a vapor into the pores of the skin—[D D N J, F D C 223, April 1941]

**Robinson Spring Water**—Robinson Spring Water Company, Jackson, Mich. Shipped between July 26 and Aug 2, 1939. A water whose scant mineral matter consisted chiefly of common salt, Glauber's salt, gypsum and epsom salt. Reported to contain less dissolved mineral matter than the water supply of a number of cities in this country. Misbranded because represented on label to be a natural diuretic eliminant water for diabetes and kidney and bladder disorders—[D D N J, F D C 206, April 1941]

**Rogers' Mineral Extract**—Rogers' Mineral Company, Cullomburg, Mo. Shipped Jan 25, 1940. Composition: a water containing approximately 6 per cent of mineral matter, chiefly the sulfates of iron, aluminum and sodium. Label falsely represented it as a remedy for indigestion, hemorrhage of lungs, pellagra, rheumatism, stomach ulcers, liver and kidney disorders, "T B of the bone," skin diseases, impure blood and some other conditions—[D D N J, F D C 207, April 1941]

**Saxon Six Vitamins in Tablet Form**—Royal Manufacturing Company of Duquesne, Kolomon Kovacs, Samuel S Kovacs and Martin Kovacs all of Chicago. Shipped Aug 18, 1939. Composition: adulterated because its strength differed from, and its quality fell below, what it purported to contain in that each tablet was represented to consist of not less than 3138 U S P units of vitamin A and not less than 314 U S P units of vitamin D, whereas each tablet contained not more than 50 of the first named units or 150 of the last named units. These false statements as to vitamin content also constituted misbranding as did the misrepresentation that when taken according to directions the product would provide a substantial amount of vitamin C, whereas the recommended dose would be less than 1/10 of the amount of this vitamin required daily by adults and less than 1/7 of the amount required daily by children less than 1 year old, and under 1/10 of the amount required daily by children from 1 to 12 years old. Charges dismissed as to corporation, but individuals found guilty—[D D N J, F D C 284, November 1941]

**Shivar Spring Water**—Shivar Springs, Inc., Shelton, S C. Shipped Nov 24, 1939. Composition: a slightly mineralized, slightly alkaline water containing less than one-half of 1 per cent of inorganic salts consisting chiefly of calcium and sodium sulfates, chlorides and bicarbonates. Falsely represented on label to dissolve and wash away any catarrhal mucus, cleanse the stomach and bowels, flush the kidneys, help to wash out impurities of the blood and cleanse and refresh the system—[D D N J, F D C 205, April 1941]

**Shores Ka-Vi Min Tablets**—Shores Company, Cedar Rapids, Iowa. Shipped Feb 28, 1940. Adulterated in that valuable constituents, namely vitamins B<sub>1</sub> and D, had been wholly or in part omitted or extracted from the product, misbranded because falsely labeled to contain in each tablet 140 U S P units of vitamin D and 25 International units of vitamin B<sub>1</sub>—[F N J, F D C 2097, February 1942 and D D N J, F D C 336, March 1942]

**Vegetable Cancer Compound**—Richard A Mason Chatham, N Y. Shipped between July 1 and Sept 9, 1939. Composition: essentially extracts of plant drugs including a laxative with sugars, alcohol and water. Falsely represented as effective for cancers, tumors, ulcers and all blood diseases—[D D N J, F D C 219, April 1941]

**Wemett's Salve**—J J Wemett, Los Angeles. Shipped Sept 21, 1939. Composition: essentially salicylic acid (30.1 per cent) in a petrolatum base. Misbranded because label falsely represented that it would reduce swelling and remove the soreness and inflammation from bunions—[D D N J, F D C 224, April 1941]

**Witsells Chocolate Quinine**—Witsell Bros, Dean Hill, Congress, Tenn. Shipped Nov 13, 1937. Composition: quinine sulfate (12 grains per hundred cubic centimeter) in a sugar chocolate preparation and alcohol (4 per cent). Label falsely represented it as an effective treatment for symptoms of malaria, chills and la grippe—[D D N J, F D C 220, April 1941]

### TREATMENT OF TYPHOID CARRIERS

*To the Editor*—Recent articles in THE JOURNAL on the use of medicinal agents to treat chronic typhoid and paratyphoid carriers have been interesting to health authorities. Following the optimistic reports of Saphir and Howell (May 18 1940 p 1988) and of Enright (Jan 18 1941 p 220), the Division of Communicable Disease of the New York State Health Department studied the efficacy of soluble iodophthalein in several carriers. The results were unsuccessful similar to those more recently reported by Saphir Baer and Plotke (March 21, 1942 p 964) and by Cutting and Robson (April 25 1942, p 1447).

With the cooperation and active help of Dr Kenneth Keill and Dr W M Pamphilon of the Willard State Hospital Willard N Y, six known chronic typhoid carriers were treated at that institution. The results are summarized in the accompanying table. In each of the instances it was known that the stools had been consistently positive for typhoid bacilli for more than one year and in each instance at least three specimens of feces were obtained before treatment was started. These carriers were therefore known to be excreting typhoid bacilli

#### Summary of Results

| Carrier | Time of Dye Administration and Stool Collection |    |    |   |   |   |   |   |   |   |       |   |    |    |    |    |    |    |    |     |

+ Fecal specimen contained *Eberthella typhosa*  
d Four Gm of soluble iodophthalein administered

immediately before and during the course of therapy. This ruled out the possibility that an intermittent carrier might be classified as cured.

When this experiment failed it was felt that perhaps a convalescent typhoid case would prove more suitable for treatment since the infection in the biliary tract would be of shorter duration and hence more amenable to treatment. A woman aged 40 convalescing from typhoid was treated. The onset of typhoid occurred on Sept 27, 1940 with a stormy clinical course prolonged illness and symptoms of cholecystitis. Her temperature did not reach normal until the end of February 1941. Specimens of duodenal contents were positive for typhoid bacilli as were the stools and three doses of 50 Gm each of iodophthalein were given at four day intervals. The stools during and after therapy were positive.

Still another carrier whose gallbladder had been removed was treated in the hope that the removal of the major part of the diseased tissue would leave a less severe focus amenable to treatment. This woman aged 60, had a history of typhoid in 1901 with positive stool specimens in September 1936. Her gallbladder had been removed in November 1936 but her stools continued to be positive. Duodenal contents obtained in March 1939 were positive. She was treated in the same way as the other patients (three doses each of 4 Gm) with similar lack of success.

Commissioner of Health (Formerly Epidemiologist  
New York State Health Department)

### "HIGH FAT DIET PRECEDING CHOLECYSTOGRAPHY"

*To the Editor*—Under this title an article by Dr Howard Curl appeared in the June 20 issue of THE JOURNAL. Since cholecystography is widely employed and since the program recommended by the author may cause much unhappiness to patients with biliary disease (namely a week or two on high fat diet preceding roentgen examination) it seems advisable to point out certain discrepancies in his remarks.

He states that 28 per cent of gallbladders in a group of healthy young medical students failed to concentrate iodophthalein. This extraordinarily high figure suggests some error in technic. It is noteworthy that this group was the first one examined and therefore technical difficulties or misunderstandings may have been greater than in the subsequent tests (which were made on the same group). Further, the author states that colonic cleansing was never used. It is well known that a fecal laden transverse colon may readily hide a normal concentrating gallbladder and be rectified by a simple water enema.

The results following the low fat and high fat breakfasts are not intelligible without mentioning the apparent size of the gallbladders immediately prior to these meals and the size which they were at a specified time following those meals—data not given by the author.

In his comments appear the statements "Groups 4 and 5 demonstrate the fact that in many patients on a low fat or carbohydrate diet the gallbladder will not admit opaque bile in quantities sufficient to cast a shadow. While occasionally calculi are demonstrated in patients free from any evidence of cholelithiasis, it is not common in this age group." Now, groups 4 and 5 do not demonstrate such facts, the conclusion is merely the author's contention or hypothesis. Further it is well known that many calculous gallbladders fill well with dye.

Cholecystography is a good test for the presence of nonopaque calculi. It is not a good test for gallbladder disease, since even with only a small portion of the gallbladder mucosa remaining intact an excellent shadow may be obtained. The author, being an anatomist perhaps overlooked this fact. That there are factors which interfere with the filling of the normal gallbladder is unquestionable, but to conclude that his investigation showed that the principal factor is the presence of thick bile in the bladder resulting from a low fat diet is incorrect. May I urge your readers not to inflict a "high fat diet for several weeks" before cholecystography on the dyspeptics of this happy land. It is neither necessary nor wise. Simple adherence to correct fasting and radiographic technic will result in satisfactory cholecystograms in the great majority of cases.

L HENRY GARLAND MD San Francisco

### CONTAMINATED MEDICINE DROPPERS

*To the Editor*—In THE JOURNAL May 30 is a communication on nose drop contamination. This prompts a thought relative to the use of dropper bottles for eye medicines.

I think it is careless to say the least for the eye physician as well as others to instil drops in eyes with the use of a general dropper which contaminates the solution and which could easily cause a spread of infection to other patients. For many years in my office I have used droppers which are boiled after use and are never put into the solution to be dispensed after the dropper has been used on the patient.

It interests me that one large drug house which is doing much to popularize the use of a reasonably new eye medicament sells it and samples it in a container with a dropper cap which invites cross infection.

I believe that the practice of the use of a common dropper should be relegated to the museum or antiquity.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACT

Malpractice Prenatal Injuries to Infant—The plaintiffs, husband and wife, filed a suit for damages, on behalf of themselves and their minor child, against the defendant charging him with malpractice resulting in injuries to the child prior to its birth It was alleged that prior to the child's birth his mother had gone to the defendant physician for medical attention and that, because of the defendant's negligence in diagnosis and the application of roentgen treatments, the child was born a microcephalic and an idiot, without skeletal structure, sight, speech, hearing or the power of locomotion The defendant filed a motion to dismiss the complaint on the ground that an infant has no right to maintain an action for injuries sustained while en ventre sa mere This motion was denied by the trial court (Stemmer v Kline, 17 A (2d) 58 (N J, 1940), J A M A 119 367 [May 23] 1942), and the case proceeded to trial before a jury, resulting in verdicts and judgments for the plaintiffs The defendant physician then appealed to the Court of Errors and Appeals of New Jersey

The important question involved in this case, said the court is whether or not, for injury sustained by the fetus before birth because of negligence of the defendant, the child, when born, has a right of action In answering this question the court said that while there is some divergence of judicial opinion, the great weight of authority in this country is to the effect that, as in cases of injury causing death, there is no right of action at common law, such right exists only as the result of a statute There being no such statute in New Jersey, the judgment of the trial court in favor of the infant was in error The court was likewise of the opinion that the judgment in favor of the parents should be reversed because "an act or omission which would not support an action for damages by the person injured thereby will not furnish a ground of action by the parent or spouse of the injured person for consequential damages" Final judgment in favor of the defendant on the entire case was entered by the Court of Errors and Appeals

The chief justice filed a specially dissenting opinion in which he stated that he was unable to agree with the majority of the court He first quoted Blackstone to the effect that "Life begins in contemplation of law (italics supplied) as soon as an infant is able to stir in the mother's womb" an infant en ventre sa mere is supposed in law to be born for many purposes," pointed out that an abortion was illegal at common law and held that the common law therefore did recognize an unborn child as a person If such child is not a person, the justice continued, why is an abortion illegal at common law? If such unborn child is to be regarded as a non entity, actually or legally, why may it not at common law be destroyed with impunity? The law does not concern itself with nonentities If the common law protects the rights of the unborn child and if every intendment in the law is favorable to him, the inference was inevitable to the chief justice that such unborn child is a person and possesses the rights that inhere in a person even though he is incapable himself to assert them If the unborn child may not legally be deprived of his life it is hard to understand how that life may with impunity be totally impaired by the tort of a third person If the civil rights of an unborn child begin with conception as to property and the like, on what reasonable ground may there be a distinction against its rights to recover for serious personal injuries done it through the negligence of a physician? Three judges concurred in this dissenting opinion and a fourth felt that the facts proved in the case supported a cause of action for the infant Still another justice filed a specially concurring opinion in which he agreed that the judgments for the plaintiffs should be reversed but specifically stated that he was "unable to agree with the holding of the majority of the court, denying the right of a child to recover for injuries negligently inflicted upon it before birth On this phase of the case he agreed with the

reasoning of the chief justice's dissenting opinion. In the opinion of this justice the judgments for the plaintiffs should be reversed because of an erroneous ruling of the trial court on a question of the admission of evidence. An essential ingredient of the plaintiffs' case was evidence that the pelvic irradiations were the cause of the infant's tragic condition when born. To establish this fact the plaintiff called as a witness a doctor of philosophy with extensive experience in the field of psychology and connections with many institutions handling mental deficiencies. He had examined the child about nine months prior to the trial of the cause. His examination was not for the purpose of treatment and was at the request of counsel for the plaintiffs. Prior to the examination he was given a history of the parents and a history of the child. Both histories, he testified, being essential in forming his opinion as to the cause of the infant's condition. Objection to his testimony was interposed on the two grounds that the answer to certain questions would necessarily call for hearsay testimony and that it would call for a history, and that the witness, being called as an expert, could neither use nor refer to the history but was limited to testifying as to the result of his examination. The objection was overruled. This witness admitted on cross examination that his opinion could not be based solely on his examination of the child but that part of the needed information was given by members of the family and by members of the medical profession. He testified, too, that he accepted the report of his colleague that the dosage was sufficient to produce the condition but that he was not informed as to the dosage. If there was any doubt about the inadmissibility of this evidence, this justice said, it was removed by the Court of Errors and Appeals in *Sandford v. Chanaz Co.*, 117 N. J. L. 485, 189 A. 670, in which case the court said:

We think it is perfectly plain that almost throughout the examination of these medical experts there was a violation of the general rule that, where the statements of the party are made not to his own medical adviser for the purpose of proper medical treatment but are made to medical experts for the purpose of enabling that expert to give his opinion evidence in a court of law they are obnoxious to the rule excluding hearsay evidence.

To the concurring justice it was apparent that the opinion of this witness was improperly admitted in evidence and that the error called for a reversal if it appeared that the substantial rights of the defendant were injuriously affected. Since the cause of the infant's condition was at the nub of the controversy, since the great numerical weight of the medical testimony was to the effect that roentgen applications were not its cause and since without the testimony of this witness the plaintiffs' case on this essential aspect depended on the opinion of one physician the justice was of the opinion that the substantial rights of the defendant were indubitably injuriously affected—*Stemmer v. Kline*, 26 A. (2d) 489, 26 A. (2d) 684 (V. J. 1942).

**Malpractice Suit Instituted Eleven Years After Alleged Negligent Extraction of Teeth**—The plaintiff brought suit for malpractice against the defendant dentist in 1941. She alleged that for about four months in 1930 the dentist undertook to render dental care for her and in the course of the treatment so negligently extracted twenty-six of her teeth that portions of the roots of six of them remained embedded in her jaw and that, although the dentist knew of that fact and although good dental practice required further treatment, the dentist represented to her that no further care or treatment was necessary. Accordingly she sought no further care. Subsequently, so the patient alleged, she "suffered serious ill and generally run down health" and from about 1937 to Feb. 15, 1941 she consulted and was examined by many physicians relative to her condition but was not advised by them as to the cause of her condition until a roentgenogram, taken Feb. 15, 1941, revealed the presence of the broken roots, "all in a highly infected state," and that thereafter she was advised that her run-down condition was due to the negligent extractions and discharge from further treatment in 1930. Holding that the action was barred by a section of the Code of Civil Procedure of California which provides that "actions founded in negligence must be commenced within one year, the trial court sustained a demurrer and would not permit the plaintiff to

amend her complaint. The plaintiff then appealed to the district court of appeal, second district, division 2, California.

The judgment of the trial court, said the appellate court, must be reversed on the authority of *Huisman v. Kirsch*, 6 Cal. (2d) 302, 57 P. (2d) 908, which holds, in effect, that the statute of limitations does not run against a plaintiff in a malpractice action until he knows the cause of the injury on which he bases his claim for damages, or by reasonable care and diligence should have known the cause of his injury. From the allegations of the complaint in this case, continued the court, it appears that the patient had no knowledge of the negligent acts of the dentist until within four months of the filing of the complaint. It was incumbent on her to establish that she did not know the cause of her ill health within one year from the date of the filing of the complaint and that her failure to gain such knowledge was not due to a failure to exercise reasonable care and diligence. She alleges that during the four year period before the filing of the complaint she consulted and was examined by many physicians concerning her "generally run-down health" and that she was not apprised that her condition was caused by the "negligent extractions" until a roentgenogram was taken. This is tantamount to an allegation that the physicians consulted did not ascertain or advise her as to the true cause of her ill health. Doubtless improvement could be made on these allegations by giving the names and standing of the physicians consulted, the nature of their examinations and the advice given but the trial court erred in sustaining the demurrer without leave to amend thus preventing the making of more specific allegations by the plaintiff. The practice of medicine is not an exact science and it is a matter of common knowledge that physicians frequently find great difficulty in determining the cause of "generally run-down health." Especially is this true in the case of a person whose teeth had been extracted in such manner as to leave many of the roots remaining with the patient. It could not be held as a matter of law that the patient had failed in the exercise of due diligence if she and her consulting physicians felt it unnecessary to have roentgenograms made of the jaws from which the teeth had been extracted at least seven years earlier, at which time the extracting dentist had given assurance that no further dental care or treatment was necessary. For the reasons stated, the judgment of the trial court was reversed and it was directed to permit the patient to file an amended complaint if she cared to do so.—*Faith v. Erhart* 126 P. (2d) 151 (Calif., 1942).

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Sulfapyridine in Pneumonia**—Scherlis reports a series of 241 unselected cases of pneumonia treated with sulfapyridine in 1938-1939 and 1939-1940, with 21 fatalities. Of the 220 patients who recovered, 175 responded with a drop of temperature to a normal and maintained level within forty-eight hours. The remaining 47 showed no such dramatic drop of temperature. Failure to respond promptly was much more frequent among patients with patchy involvement than in those with a true lobar consolidation. Of those failing to respond promptly, only one fourth had true lobar involvement. The types of bacteria responsible for the lobar pneumonia or the bronchopneumonia were determined. It was found that if the predominating organism in the sputum was the pneumococcus (168 cases) most of the patients responded promptly to treatment (crisis 141, lysis 27), but if staphylococci or streptococci predominated (52 cases) a greater proportion did not respond promptly to sulfapyridine (crisis 32, lysis 20). Of 12 patients with lobar pneumonia who did not respond promptly, 10 had complications, of 35 with bronchopneumonia who did not respond promptly,

17 had complications. The complications were otitis media in 16, mastoiditis in 3, pleural effusion in 9 and empyema in 2. There were 13 patients with bacteremia, 3 died, empyema requiring thoracotomy developed in 1, 2 had sterile pleural effusion and in 1 resolution was delayed. The response to sulfapyridine was prompt in 3 and the response, if any, was delayed in 9.

**Meningococcal Meningitis**—The general scheme of treating the 50 cases Campbell discusses consisted in daily or semi-daily intraspinal, intravenous and intramuscular injections of a potent highly concentrated antimeningococcus serum. During the last two of the four years of the study, sulfanilamide was added. The average total amount of serum given to each patient in the serum group was 108 cc, and in the serum plus sulfanilamide group it was 109 cc. Of the 50 cases 5 were of the fulminating type, with death in all 5, 4 within twenty-four hours of admission. All these fulminating cases occurred in the serum treated group. Of the other 35 patients treated with serum 15 died, and of the 10 treated with serum and sulfanilamide none died. Deafness, at one time a common complication, occurred only once in the series, 1 patient had mild jaundice following the administration of sulfanilamide. The only other complication attributable to the sulfanilamide was vomiting by the patient with jaundice. Four patients had bronchopneumonia, 1 of whom died. Four had signs and symptoms suggestive of meningococcemia. The most prominent characteristic of the condition was the prolonged period of illness (fourteen, twenty-one, thirty-five and forty-two days respectively) before admission to the hospital. The average duration of illness before hospitalization of 41 of the other patients giving a reliable history was three and one-tenth days. The septicemic stage of the 4 patients was characterized by intermittent fever, arthralgia, rash, headache, chills and sweats. All 4 had meningitis presumably as a result of a chronic meningococcal septicemia, 3 recovered promptly following the administration of small doses of antimeningococcus serum and 1 after treatment with serum and sulfanilamide. Careful study of the features of the disease among the 50 cases reveals a high number of multiple cases, one family of 3 members were all affected within one month, and a second group of 3 cases occurred in a building that housed two Negro families. The 50 cases are represented by 48 persons, 3 of whom had second attacks. Such a high incidence of second attacks would seem to indicate that the degree of immunity is not very durable. The average period of hospitalization for 20 serum treated patients (recovered) was thirty-six and three-tenths days and for the serum and sulfanilamide group it was twenty-six and seven-tenths days. On the basis of the collected results of seven different methods of treating 2,747 cases of meningococcal meningitis, chemotherapy alone or in combination with immune serum appears to be the most effective treatment.

**Protamine Zinc and Regular Insulin in Diabetes**—Ralli and her associates have observed for from one to five years 34 ambulatory patients with diabetes mellitus who were on regular insulin and who were later transferred to protamine zinc insulin. The diets were not significantly changed at any time, so that a fair comparison was possible. The ages of the patients varied from 14 to 81, there were 14 males and 20 females. The majority had had diabetes for about nine years, and in all but 2 the disease was severe. The authors are not of the opinion that it is absolutely imperative to control glycosuria, nor does it seem wise to allow unrestricted glycosuria, which is usually attended by a loss of weight and a tendency to ketosis. They tried to keep each patient moderately sugar free, to maintain his body weight and to provide him with a diet adequate for his daily needs. Enough insulin was given to accomplish these results. The criteria they used to indicate improvement on protamine zinc insulin were a smaller number of daily injections, improvement in the patient's general condition and a decrease in the number of units of insulin required. Nine of the patients did not improve on protamine zinc insulin. They did poorly and were returned to regular insulin. The difficulty with most of them was severe insulin shock, severe enough to cause unconsciousness, regardless of the time the protamine zinc insulin was given. The other annoying symptom was intense headache. Four patients did no better on

protamine zinc insulin than on regular insulin. One patient did well on protamine zinc insulin alone for almost four years but then became difficult to control and was returned to regular insulin. Of the other 20 patients, 6 have been well controlled on protamine zinc insulin alone and 14 have required combinations of the two insulins.

#### Tonsillectomy and Respiratory Infections in Children

—Kaiser followed the development of 4,400 children to adolescence or a period of ten years, recording the sequence and the number of respiratory infections over this period. Half of the children had their tonsils and adenoids removed and the other half did not. The initial examination and observation of the children began when they were between 4 and 7 years of age when for various reasons only half of them were submitted to tonsillectomy. The evidence indicates that there is a relationship between tonsils and adenoids and respiratory infection. Tonsils and adenoids favorably influence the upper type of respiratory infection and not the lower respiratory or pulmonary infections. The tonsils may even act as a safeguard against pulmonary infection since in the unoperated children there was a slightly lower incidence of bronchitis and pneumonia. The measurable benefits of tonsillectomy and adenoidectomy in children subject to tonsillitis, colds, otitis media and cervical adenitis justify the operation and make it a desirable procedure. The benefits though striking in the presence of tonsillitis and cervical adenitis are not great enough to advocate prophylactic tonsillectomy for children with the idea of reducing respiratory infection. The statistical evidence agrees with the general clinical experience that certain infections of the upper respiratory tract can be reduced if the tonsils and adenoids are removed but other infections may actually occur more frequently after the operation. The respiratory complaint to which the child is most susceptible must determine whether the tonsils or adenoids are likely a liability. When the tonsils and adenoids enhance the production of clinical symptoms their removal is advocated.

#### Upper Respiratory Infections and Chronic Arthritis—

From their experience during the last thirteen years in the arthritis clinic of the Presbyterian Hospital on the relation of tonsillitis to arthritis Boots and McCollom conclude that routine tonsillectomy is not indicated in any form of arthritis.

The type of arthritis should be diagnosed before any relationship to a respiratory or any other focus is considered. Osteoarthritis, gonorrheal arthritis, tuberculous arthritis and other types are certainly not related to infection of the upper part of the respiratory tract. In rheumatoid arthritis it is wise to remove apparently diseased tonsils and to treat sinus infections, not because of any proved etiologic relationship, but because anything that improves the patient's health seems to help the arthritis. The question of tonsillectomy or treatment of sinusitis is still largely a clinical decision to be made by the physician, preferably by a combined consultation between the internist and the otolaryngologist. Early treatment of the sinuses and early removal of the infected tonsils is necessary if any benefit in rheumatoid arthritis is to be forthcoming. The results in private practice are probably better than those obtained in clinics probably because patients are usually seen earlier and possible foci are treated and eradicated at an earlier stage of the disease.

#### Evaluation of Preparations of Vitamin B Complex—

Pett and his colleagues determined the relative value of six commercial vitamin B complex preparations purchased in the open market. The natural sources of the preparations were yeast, liver and rice bran. The preparations were fed to rats on a diet free of vitamin B complex so that the thiamine intake was uniform in all groups. The best results came from using a preparation in which the proportions of the members of the vitamin B complex were thiamine 1, riboflavin 0.8, pyridoxine 0.4, pantothenic acid 1 and nicotinic acid 5. The poorest results were obtained from a combination of thiamine 1, riboflavin 0.05, pyridoxine 0.05, pantothenic acid 0.1 and nicotinic acid 2.5. The results emphasize the importance of adequate amounts of all the B complex together with thiamine. The gross disproportion among these components in some of the preparations apparently resulted from adding such synthetics as thiamine or nicotinic acid to the original source material. At different levels of thiamine intake the relative importance of the components of the B complex changed. Thus with higher amounts of thiamine the riboflavin content was of greatest importance while with smaller quantities of thiamine the pyridoxine and nicotinic acid content seemed to be more important than that of riboflavin.

**Coarctation of Aorta**—Irvine reports 2 cases of coarctation of the aorta. In the first the condition was detected during routine roentgen study of the chest. The diagnosis was made on the pathognomonic finding of pressure defects in the inferior surfaces of some of the ribs. The symptoms that caused the patient to seek medical attention were caused by bronchopneumonia. The history of chest pain some weeks

before admission may or may not have been related to the coarctation. Hypertension in the upper extremity, exaggerated pulsations in the vessels of the neck, souffle over the collateral arteries and left sided cardiac hypertrophy supported the diagnosis of coarctation. The condition of the second patient, an army recruit, was accidentally discovered in the course of a roentgen examination of the chest. The diagnosis was based on Rosler's sign of erosion of the ribs. A later clinical examination confirmed the roentgen diagnosis by revealing visible and palpable pulsations due to the dilated collateral anastomosis, hypertension in the upper extremity and disparity between the blood pressure of the brachial and femoral arteries. A case report supplied by Malcolmson was also of a recruit with the pathognomonic defects of the ribs in the roentgenogram and secondary cardiac enlargement. There was a definite hypertension in both arms with a much lower tension in the femoral arteries. A bruit was readily detected over the anastomosing branches in the scapular and upper thoracic areas. The condition in this recruit had been overlooked in the first routine medical examination.

**Odors as Allergenic Agents**—Clinical and experimental evidence presented by Urbach suggests that osmys (pleasant or unpleasant odors of flowers, fruits, resins, animals, plants and animal foods) can act as allergens. Pollens head the list of allergens responsible for most cases of hay fever. In some patients nasal symptoms or asthma appear in the vicinity of roses, locust trees, linden trees, mock oranges, carnations, privet, lilacs, common elders, lilacs, lilacs of the valley and violets. Pollen as cause of rhinorrhea can be excluded in such instances if the blossoms in question have no stamens and thus no pollen,

if the peculiar position of the stamens surrounded by a carina makes it impossible for pollen to be carried off by the wind and if insufflation of the particular pollen into the nostril of the patient elicits no symptoms. Exposure to fresh blossoms and extracts of blossoms demonstrates that odors and not pollens are operative. The author has observed cases of hay fever which were proved by these methods to be due to volatile oils. It was not possible to determine which ingredient of the ethereal oil of the blossoms caused the hay fever. In some instances allergic symptoms develop from the mere odor of certain animals without the patient coming into actual contact with them. For some persons allergic to the smell of dogs the proximity of a person owning a dog is sufficient to provoke an attack. The degree of such hypersensitiveness is illustrated by a woman in whom extensive angioneurotic edema, usually followed by severe anaphylactic collapse, developed every time she passed a street in which a fish market was located. In this group there are patients who are so hypersensitive to animal protein that even the smell of the particular food (meat or fish) elicits symptoms identical with those appearing after its actual ingestion. Allergic phenomena caused by scents other than those of plant and animal origin include inorganic compounds, synthetic perfumes employed in cosmetics and soaps, sulfuric emanation in a sulfur spa and the smell of burning wood, charcoal, kerosene and tobacco. Experiments with oral desensitization with substances prepared by the process of enfleurage proved successful for scent allergies.

**Inhibition of Sulfapyridine in Human Serum**—Boroff and his associates found that an antisulfapyridine action is widely distributed in human serums, transudates and exudates. Almost all body fluids studied showed some antisulfapyridine action against a concentration of 1 to 15 mg of the drug per hundred cubic centimeters of fluid. No change in inhibitory action could be demonstrated against fluids obtained at different times from the same individuals. The apparent decrease in inhibition observed after prolonged standing was attributed to the shift of pH of the mediums to 8.6 to 8.9, which is unfavorable to growth. For the first four hours the growth curves with and without sulfapyridine were the same. At the end of

that time there was a gradual decrease in the number of organisms in the mediums containing the drug. If the mediums contained an inhibitor, and if the amount of the drug was not too great, the descent of the population curve was arrested after six to eight hours and showed a gradual rise. This phenomenon was observed in most of the growth curves whether the inoculum was 30 or 1,000 organisms per cubic centimeter. With the same inoculum the same amount of drug produced significant differences. When a small amount of an inhibiting serum (0.2 to 0.5 cc) was added to the control mediums containing no inhibitor the control mediums became inhibitory, this did not occur when serum which was not inhibitory was added to the mediums. These observations suggest that the growth promoting properties of the mediums do not wholly explain the inhibitory action of body fluids against sulfapyridine. Apparently there are substances in serums, exudates and transudates which interfere with the action of sulfapyridine in vitro.

**Pleurisy with Effusion as Manifestation of Rheumatic Fever**—Hansen discusses the difficulty which may arise in making a correct diagnosis when the less common manifestations of rheumatic fever such as pneumonitis and pleuritis, are present. This is illustrated by a patient in whom a recrudescence developed whose main feature was pleurisy with effusion. A boy of 12 had a sudden onset of fever with slight dyspnea and pain in the chest several weeks after a typical attack of polyarthritis. Failure to isolate any organism in the pleural fluid and the rapid resorption of the exudate seemed to establish this as a clearcut rheumatic pleurisy with effusion. The pleural effusion may be purulent, serous, serofibrinous and serosanguineous. The general manifestations of rheumatic fever are not specific but may occur with any type of infection. Those which occur characteristically and frequently include epistaxis pallor (out of proportion to the hemoglobin), weight loss, fatigue, fretfulness, anorexia, malaise, lassitude, weakness, emotional disturbances, 'growing pains', prostration, rapid pulse, leukocytosis, secondary anemia and malnutrition. These signs and symptoms often antedate the more severe and specific manifestations by weeks or months and are important in detecting signs of rheumatic activity or recrudescence.

**Adrenal Insufficiency in Childhood**—Anderson presents the history of an 11 year old boy with clinical signs and symptoms of Addison's disease. A primary atrophy of the adrenals

is believed to exist, since no evidence of tuberculosis or of a tumor of the adrenals could be found. The response to therapy was entirely satisfactory. Growth in weight and height has progressed normally. Holt and McIntosh have stated that adequate treatment for several years has been associated with some regeneration of adrenal cortex tissue as judged by continued clinical improvement and decreased hormone requirement. Following the impending Addisonian crisis at the time of the original laboratory studies, large quantities of sodium chloride and dextrose were given intravenously. A low potassium, high sodium diet was then instituted. Daily, 5 mg of desoxycorticosterone acetate in sesame oil and 6 cc of adrenal cortex extract were given intramuscularly. Within three days the electrolytes of the serum and the hematocrit were essentially normal. The blood pressure increased to 100 systolic and 60 diastolic. Following discharge from the hospital the child was allowed to take a general diet, and the desoxycorticosterone acetate and adrenal cortex extract were continued. Weight gain continued to be satisfactory. The child was well and vigorous and assisted in the labors about the farm without fatigue or complaint. He was then placed on 5 mg of desoxycorticosterone acetate in propylene glycol sublingually twice a day and has been doing well for approximately one year since discharge from the hospital.

**Hay Fever in Children**—According to Stoesser, symptoms of hay fever were found in about 20 per cent of children reporting in the outpatient department with an allergic disease during 1936 to 1941. The onset occurred in a few patients during their first year, a much larger number began to manifest signs in the second year and there was a rapid increase during the preschool period. The majority of the 413 children treated did not come for treatment until they had attended school. The severity of symptoms usually increased during the school years, and the children's poor condition on their return to school in the fall focused medical attention on them. The determination of seasonal pollinosis consisted in cutaneous tests with the sixteen pollens prepared by Ellis and Rosendahl of the University of Minnesota. Positive cutaneous reactions were obtained to maple (box elder) in 69, birch 23, poplar (willow) 55, elm (nettle) 38, sedge (bulrush) 30, ash 65, oak 54, grass 72, walnut 33, plantain 24, dock (sorrel) 39, alfalfa 58, pigweed 115, Russian thistle 146, sage (wormwood) 209 and ragweed 306. Of the 413 children 310 were chosen for specific pollen injection therapy, of 24 having long preseasonal therapy to the pollens of trees the results were good in 79.2 and fair in 8.3 per cent, of 19 receiving similar therapy to the pollens of grasses 36.8 had good and 42.1 per cent had fair results, the results were good in 59 and fair in 31.3 per cent of 195 given injection treatment to the pollens of weeds, and perennial therapy gave good results in the 6 children receiving treatment for tree pollens and of 82 receiving this therapy to weed pollens 59.8 had good and 20.7 per cent had fair results. The author concludes that long preseasonal or perennial specific pollen therapy is still the best treatment for hay fever in the child. The oral administration of pollen did not give satisfactory results. Enzyme therapy with histaminase failed completely. Potassium chloride therapy benefited enough children with seasonal pollinosis to warrant further investigation. Coli metabolin therapy was of little value.

- \*Slipping Rib Cartilage Syndrome with Report of Cases J F Holmes, Manchester, N H—p 89  
Pulmonary Suppuration Secondary to Esophageal Diverticulum F T Hill, Waterville—p 99

**Slipping Rib Cartilage**—Holmes calls attention to a group of painful symptoms involving rib borders, chest, abdomen and back. The syndrome is concerned with the anterior ends of the anterior rib cartilages, their interchondrial articulations and the closely related intercostal nerves. It does not involve the osteochondral junction of the anterior ends of the ribs, it includes only the anterior cartilages of the first three false ribs, designated as vertebrochondral ribs, namely the eighth, the ninth and the tenth on either side. This symptom complex was first reported by Cyriax of London in 1919. It is of common occurrence and often produces irksome, incapacitating symptoms. Because of failure to recognize it, needless laparotomies have been performed, and prolonged suffering and incapacity from an easily curable condition were permitted. The loosening and deformity of the anterior ends of the anterior cartilages of the vertebrochondral ribs begin by a pulling away of the fibrous attachment of the anterior end of the cartilage. The deformity is the result of a displacement of a fracture fragment or a dislocated cartilage, or, as is usually the case, by a curling upward of the loosened cartilage end so that, on motion, the deformed end rubs against the inside of the rib cartilage above and against the intercostal nerve, causing pain. On certain motions and on manipulation the deformed end slips over the rib border with a click that usually can be felt and heard and a pain that is often severe. From an analysis of 68 cases it appears that slipping rib cartilage results more often from indirect than from direct trauma. Since the cartilage deformity almost always develops over a period of time subsequent to the trauma, the patient frequently does not associate the injury with the complaint, and the cause is not recognized. This is especially true of indirect injury when, as in coughing or in childbirth, the trauma itself is frequently not recognized. A sudden blow of the steering wheel of an automobile against the lower ribs is one method of direct injury. Indirectly it may be caused by sudden flexion, extension or twisting of the body, by repeated distortion of the body as the onesided weight carrying of an industrial worker, by a sudden pull on the arms as in weight lifting or pushing, by forced compression or expansion of the chest as in childbirth or coughing, and by many other types of force. The author treats the acute condition conservatively by adhesive strapping. If after one to three months the symptoms persist, he advises excision of the loosened cartilage. Many cases of obscure pain associated with the chest or abdomen may have their origin in a slipping rib cartilage. Examination of rib borders should be made routinely.

**Bovine Antitoxin for Tetanus Prophylaxis**—According to Glaser, bovine antitoxin for the prophylaxis and treatment of tetanus and diphtheria was introduced by Kraus and his associates in Buenos Aires about 1921. They demonstrated that bovine tetanus and diphtheria antitoxic serums were just as effective as equine preparations and to a large extent free from the disagreeable sequelae of horse serum. Bovine tetanus antitoxin was introduced into this country in 1929. The author's experience with bovine tetanus antitoxin comprises 38 cases. The patients ranged in age from 1½ to 18 years with an average age of 7. The author reports 2 cases. The first patient was a boy who had been dragged along the road in an automobile accident. A severe anaphylactic reaction followed a routine intradermal test with horse serum. A few days later a test with bovine serum was negative. The boy was given bovine antitetanus antitoxin without difficulty. The second patient was a boy who had had asthma since the age of 2.

Horse serum antitoxin administered for severe lacerations was followed by a severe reaction. Scratch and intradermal tests with bovine serum being negative, bovine tetanus antitoxin was given in divided doses without difficulty. Of the 38 patients 15 (39.5 per cent) experienced some reaction to the bovine antitoxin varying from mild itching at the site of injection to two moderately severe attacks of serum sickness. The usual reaction was the appearance of a few urticarial wheals lasting from a few minutes to a few hours. In no case was there an immediate anaphylactic reaction. The author concludes that 1. Bovine tetanus antitoxin has been used with safety in selected cases known to give severe anaphylactic reactions to horse serum. 2. The only indication for the use of equine tetanus antitoxin is for patients who are known to be or can be demonstrated to be sensitive to the bovine but not to the equine preparation. 3. Persons undergoing study for allergy should be tested routinely with equine and bovine serum. This should be done by the scratch method only to avoid as far as possible sensitizing the patient to the serum. If the patient is sensitive to both serums he should be immunized by tetanus toxoid.

**Histaminase in Preventing Ivy Dermatitis.**—Moss investigated the effect of histaminase in preventing the cutaneous reaction of susceptible individuals to poison ivy. Eight subjects who had had ivy dermatitis the previous summer were observed for ten days in a summer camp at which it was practically impossible to escape exposure. Four of the subjects were given orally 45 units of histaminase daily and the remaining 4 served as controls. During the ten days ivy dermatitis developed in 2 of those not treated, in 1 rather extensively. In none of the 4 receiving histaminase did dermatitis develop. Two subjects who had had dermatitis the previous summer deliberately exposed themselves to the plant after taking 45 units of histaminase daily for ten days, lesions did not develop. A group of 35 campers were observed for twenty-five days. 9 admitted having had dermatitis the previous summer. These 9 campers were given 45 units of histaminase by mouth for the twenty-five days. The remaining 26 subjects were used as controls. One of those receiving histaminase had diarrhea twenty-four hours after the first dose was given and was excluded from the study. Of the 8 subjects receiving histaminase dermatitis a 2 cm area on the knee developed in only 1. Ivy dermatitis developed during the twenty-five days in 13 of the 26 controls. Four subjects all susceptible by history, deliberately exposed themselves by rubbing the plant into the skin after taking 60 units of histaminase daily for ten days, and only 2 had lesions.

**Cobra Venom for Osteitis Deformans.**—A case of osteitis deformans with extremely severe pain is reported by Taylor in which definite relief followed the administration of cobra venom according to the method of Macht. Relief followed the first few doses, and thereafter a few semiweekly doses and then weekly doses for about six months have kept the patient comfortable. After this treatment was discontinued temporarily, and only a few doses of venom have been required to keep the patient comfortable for two years. The results seem to justify the trial of cobra venom in other cases of osteitis deformans.

**Irradiation for Cancer of Breast.**—Irradiation for the patient with a frankly inoperable mammary cancer with or without secondary manifestations, although hopeless from a curative standpoint, O'Brien points out produces enough palliative benefit to warrant its employment if the patient is not moribund. Ulcerating breasts will frequently heal and axillary and supraclavicular nodes regress but more often than not while this proceeds secondary deposits appear in the skeleton or other organs. These patients should have proper medical supervision, antianemic and supportive remedies, sedatives and

relatively small doses of radiation help some patients to live in comparative comfort for a few months to years. Irradiation as the sole therapeutic measure seems justifiable in especially organized clinics in poor surgical risks and borderline cases. Irradiation to the exclusion of surgery should not be employed for that group of mammary cancers which with radical mastectomy give a five year cure rate (alive without disease) of 70 per cent or better. A local operation even for a probable early breast cancer does not give a patient a chance for recovery. Preoperative irradiation in amounts to sterilize the tumor is neither desirable nor necessary. Its chief preoperative application should be to modify the undifferentiated young neoplastic cells, as Coutard has recognized. This can be done with relatively small doses given within a reasonable time and without the production of fibrosis. Surgical intervention can be then instituted before new young cells appear, that is, before the twentieth day and in any case before the slight cutaneous reaction of the twenty-fifth day. Many more fields of irradiation should be utilized than is the prevailing custom. It is not sufficient to treat the affected side of the chest, axilla and supraclavicular chain of lymphatics, the mediastinum and parasternal nodes and lymphatics of the opposite breast must also be treated over a protracted period. Postoperative irradiation does not seem necessary for patients whose disease is localized to the breast. If castration by irradiation is to be recommended, it must be done with the understanding that there are several stimuli that will induce cell division in tissues in which growth is normally dominated by hormones. This knowledge explains some of the failures of castration and reminds one that cancer growth and its cure continue to be a complex matter.

**Radiation Osteitis of Ribs**—During the last ten years Paul and Pohle have observed changes in the ribs of 15 patients who had received postoperative irradiation after removal of a breast for cancer. The authors obtained roentgenograms of the chest at intervals of three to six months. This has been found of value in the early detection of metastasis and pleuropulmonary reactions secondary to irradiation. Study shows that 10 of the patients received total doses to each field of from 5,200 to 6,600 roentgens over periods ranging from thirteen to thirty-six months. The other 5 received somewhat smaller total doses. At varying times after the full course of therapy there were noted changes in the underlying ribs consisting of pathologic fracture or fractures, a variable amount of bone absorption at the edges of the fractures and absence of reparative change over periods up to three years. Usually the first roentgen evidence was that of a fracture. This was manifested by a sharp change in alignment of the rib with or without a fracture line being visible. In some an irregular transverse fissure or line of increased radiotranslucency was seen first. Usually after some months the rarefied zone became more pronounced, with well defined defects in the rib shadow. Varying degrees of displacement were encountered. In 4 of the 15 the fractures healed after ten months, in 10 no healing had occurred up to three years and in 1 there was no follow-up after the fracture was discovered. In the healed cases the bone at the site of the fracture became more dense than normal. Sclerosis, if it appeared at all, occurred late and was minimal in degree. Symptoms referable to the fracture were absent. All the lesions were in the anterior or anterolateral segments of the upper ribs. In 4 only one rib was involved, in 5 two ribs, in 3 three ribs and in 3 four ribs. When the involvement was multiple, the changes were in immediately adjacent segments. In the differential diagnosis, only traumatic fracture and metastasis must be considered. Experience indicates that adult bone can be damaged by external roentgen irradiation and that the sensitivity of bone to such irradiation, if repeated over one or two years, is considerably greater than was formerly believed.

#### Mercury Bichloride Baths for Pityriasis Rosea—

According to Sutton, pityriasis rosea is a disease of unknown etiology, which behaves like an infection. It begins typically with a "herald patch" which precedes widespread involvement by a week or so, this is followed by the appearance of discrete lesions in considerable numbers involving either nearby skin and spreading gradually or involving the skin as a whole. It runs its course in perhaps ten weeks. It occurs in the spring and fall months. Effective treatment is ultraviolet irradiation. If the skin is caused to peel, the disease goes with the scales. But since some persons would prefer to suffer the disease rather than this sunburning, the author recommends a prescription of 1 ounce (30 Gm) of mercury bichloride in 16 ounces (480 cc) of water in a graduated bottle, labeled "POISON—2 ounces (60 cc) to 15 gallons of cool water for ten minute baths twice a day." The patient is requested to measure 15 gallons into his tub. The bath is to be lukewarm. No soap is used with the medicinal bath. The patient is to immerse himself in this dilution, which is about 1:15,000, twice daily for ten minutes. Stronger concentrations are irritating. If the disease has just commenced, two weeks of such treatment are necessary. If the eruption is full blown, cure may be obtained in one week. Thin skinned, xerotic patients develop dryness, a fine crackling scaling, irritation and itching by the end of four days, after which treatment must be discontinued temporarily. Greasy skinned brncts tolerate it longer. When the skin becomes dry and faintly scaly, the eruption fades and disappears. The fact that mercury bichloride is effective while sulfur is not lends credibility to the hypothesis that pityriasis rosea may be a streptococcal dermatosis.

**Chemotherapy of Acute Bacillary Dysentery**—Lyon has subjected sulfaguanidine to an extensive test in the treatment of acute bacillary dysentery, a condition that is popularly known in the mining sections as "bloody flux." The effect of the drug was first studied in a small, well controlled series of carefully selected patients who had the disease in a severe or moderately severe form and in whom treatment was instituted during the first week of fever or diarrhea. Next sulfaguanidine was used routinely in the treatment of the various forms and stages of "bloody flux" as they were encountered in office practice, homes and hospitals of mining sections where bacillary dysentery is endemic. Records are available of 300 patients with "bloody diarrhea" who were treated with sulfaguanidine.

In addition to the 'bloody diarrhea' all the patients presented a characteristic history: fever, malaise, blood and pus, or pus and mucus in the stools. A great many had positive stool cultures or characteristic microscopic evidence when particles of pus from stools were examined microscopically. Not all were bacteriologically proved instances of bacillary dysentery. They were however all patients having a 'bloody flux' typical of mining and rural mountainous areas in which the disease is endemic. Sulfaguanidine was of definite value in reducing the number of days of illness due to bacillary dysentery. This was one of the most striking effects statistically demonstrable. It is of unusual importance in industrial and military medicine. A wider use of the chemical will result not only in a continuously lower dysentery mortality rate but in a greatly lessened economic loss from days of disabling sickness. Of the 259 patients treated with sulfaguanidine without regard to the time elapsing between the onset of illness and institution of chemotherapy, 219 had normal stools within three days, 21 in four days, 17 within five days and only 2 had loose stools for more than five days. Early recognition and early treatment are important. The best results are attained when chemotherapy is applied early in the disease. It may be effective when administered at a much later time. Sulfaguanidine was as effective in adults as it was in infants and young children. Chemotherapy has completely revolutionized the treatment of bacillary dysentery. Sulfaguanidine is as effective in the treatment of acute bacillary dysentery as sulfanilamide is in the treatment of some streptococcal infections or as the other sulfonamide compounds are in the pneumococcal infections. The drug is easily administered, is well tolerated and has a wide margin of safety. It is ideal for treatment of bacillary dysentery.

**Tumors of the Submaxillary Gland**—Lack of unanimity of opinion regarding the nature of mixed salivary gland tumors, according to Dockerty and Mayo, is adversely reflected in the results of surgical treatment. Because these mixed tumors have been regarded by many as being essentially benign, surgeons all too often have yielded to the temptation to "shell them out." In recent years experience has accumulated to show the necessity for revision of some of the older concepts regarding the nature of mixed tumors. The authors reviewed records of some 500 patients suffering from 'submaxillary malignancy'. More than 80 per cent were found to represent metastatic lesions metastasizing usually having taken place from epidermoid carcinoma of the lip, nasopharynx or face. Such tumors were excluded from the present study. The authors analyzed 81

primary submaxillary malignant tumors. True mixed tumors constituted 63 per cent of the series. They represented low grade, slowly growing adenocarcinomas usually not associated with pain or fixation. The tendency toward recurrence was not pronounced, except when inadequate "tissue sacrifice" had been carried out. Adenocarcinomas of the cylindroma type accounted for 18.5 per cent. These cylindromas were associated as a rule with a short clinical history in which pain and fixation were prominent. The lesions, although of a moderate degree of malignancy, presented pronounced infiltrative tendencies with selective invasion of nerves. The rate of recurrence was extremely high and the outlook generally unfavorable. An "intermediate" group of cases was found in which the tumors shared the features of the mixed tumors and the cylindromas. Clinically also the histories of the patients justified separation of the tumors into a special category. Eight patients, 9.5 per cent, had atypical tumors described as "miscellaneous." Prognosis depended partly on the type and grade of the lesion and partly on the extent of lymph node involvement. Follow-up studies demonstrated the usefulness of the microscopic classification in relation to prognosis. The authors were impressed by the disappointing results of the conservative operation on malignant tumors of the submaxillary gland.

**Hypertension and Pancreatic Erosion in Fatal Hemorrhage from Gastric and Duodenal Ulcers**—According to Schenken and his collaborators, many factors influence the prognosis of massive hemorrhage from a gastric or duodenal ulcer. Most frequently mentioned are age, number of hemorrhages, arteriosclerosis, chronicity, sex and location. Factors less frequently mentioned are (1) hypertension, (2) erosion of the pancreaticoduodenal artery and (3) bleeding from granulation tissue buds in the base of the ulcer. In a review of post-mortem examinations of cases of fatal gastric and duodenal ulcer the authors were impressed with the high incidence of hypertension and pancreatic erosion in patients dying of massive hemorrhage. In the Charity Hospital of Louisiana during the period from 1935 to 1941 the bodies of 81 patients who died as the result of gastric or duodenal ulcer were subjected to post-mortem examination. It was found that 19, or 23.3 per cent, of 81 patients with gastric or duodenal ulcer died of hemorrhage. Eleven, 57.8 per cent, of these had hypertension. Four had erosion of the pancreas without hypertension and 3 had both hypertension and pancreatic erosion. Fifteen, 78.9 per cent, of the 19 patients had either hypertension or erosion of the pancreas or both.

**Asphyxial Resuscitation with Inert (Asphyxiating) Gas**—Thompson and Birnbaum carried out an experimental investigation in the course of which they have observed a phenomenon hitherto not described. It is one of asphyxial resuscitation which consists in restoring the circulation and respiration in advanced asphyxia without the use of oxygen through the use of rhythmic inflation of the lung with an inert gas alternating with rhythmic suction. Dogs weighing 8 to 12 Kg. were anesthetized by the intraperitoneal injection of veterinary soluble pentobarbital. In some experiments a pharyngeal airway was inserted and a specially fitted metal face mask with inflation cuff on its rim was applied. In other experiments there was inserted an intratracheal tube surrounded by an inflatable rubber cuff to make the trachea leak proof. Asphyxia was produced either by obstructing the face mask completely or by clamping the intratracheal tube. In still other experiments asphyxia was produced by inhalation of inert gases such as nitrogen or helium. The Emerson resuscitator was used. Resuscitation was found possible in a high percentage of cases and far beyond the period at which spontaneous recovery could occur by discontinuing the asphyxial procedure. With other methods of resuscitation such as manual artificial respiration, rhythmic inflation and rhythmic suction, restoration of the circulation and respiration is the exception rather than the rule. In this phenomenon of asphyxial resuscitation the heart and circulation recover first, the respiration later. Typically applied in experimental asphyxia, the positive-negative resuscitator with inert gas is kept in action until the blood pressure has definitely recovered and spontaneous respiration is begun, when the lungs are in communication with the atmospheric air. In many instances recovery may take place on discontinuing the resuscitator after the blood pressure has recovered but before spontaneous respiration has occurred.

## Serum Transfusions in the Nephrotic Syndrome—

According to Brown and his associates, the degree of edema in patients with a nephrotic syndrome depends on several factors, hypoproteinemia is the most important of these. Results of serum transfusion in the nephrotic syndrome yield conflicting evidence as to its value. The authors treated 12 patients with transfusion of concentrated human serum. Eight of the patients were considered to have Bright's disease in the nephrotic stage, in the ninth case a diagnosis of lipoid nephrosis was made, and in the tenth of amyloid nephrosis. The eleventh and twelfth cases were examples of malabsorption of protein from the alimentary tract. Dosage ranged from 10 to 15 Gm of protein in children and from 20 to 100 Gm in adults, and more than one transfusion of these amounts was given in most cases. Immediately after the transfusion the serum protein level was generally found to have risen and the hemoglobin to have fallen. The concentration twenty-four to forty-eight hours after transfusion usually was scarcely greater than before transfusion, and the hemoglobin had usually returned to the pre-transfusion level. This failure to produce an increase in serum protein cannot have been due to loss of protein in the urine in either case 12 or, in all probability, in case 11. In several other cases it appeared also that the amount of albumin passed in the urine was not sufficient to account for the failure of the serum proteins to increase. Of the 12 patients, 11 were suffering from some degree of edema at the time of the transfusions. In only 2 was a good diuresis produced by administration of serum, and in 1 of these the edema returned within ten days and failed to respond to a further transfusion. It appears that in the nephrotic stage of glomerulonephritis a transfusion of concentrated serum is as likely to be followed by an adverse as by a favorable effect.

**Intraperitoneal Use of Sulfanilamide**—Hudson and Smith have employed sulfanilamide intraperitoneally in the treatment of peritonitis and peritoneal contamination since October 1940. The average dose amounted to from 10 to 15 Gm. In most cases this was the only chemotherapy employed, in a few it was reinforced with sulfapyridine given by mouth or intramuscularly for two or three days after operation. From September 1939 to October 1940 intravenous and intramuscular chemotherapy was used in many cases with disappointing results and a fatality rate of 55.5 per cent in cases of grave general peritonitis or gross peritoneal contamination. Between October 1940 and October 1941, when sulfanilamide

was employed intraperitoneally as a routine, the fatality in similar cases was reduced to 8.3 per cent. The use of continuous gastric, duodenal or intestinal suction drainage as an additional measure is strongly advocated. Ten illustrative cases are described in which the intraperitoneal use of sulfanilamide is thought to have contributed materially toward recovery.

**Male Gonorrhea Treated with Sulfapyridine**—Laird reports an attempt to determine a standard course of treatment most suitable for the inpatient therapy of gonorrhea in service patients. He presents six schemes of treatment employed in the total series of 764 cases. The A series of cases was given 1 Gm of sulfapyridine at 8 a.m., 12 noon, 4 p.m. and 8 p.m. daily for six days (24 Gm), the daily fluid intake was 7 pints and urethral irrigation was used. The B series was treated in the same way except that irrigation was omitted. The C series was treated the same as B, but the fluid intake was restricted to 3 pints daily. The D series was given 1 Gm of sulfapyridine at intervals of four hours for four days (24 Gm) without irrigation, and the fluid intake was 3 pints daily. In the E series the sulfapyridine dosage was the same as in D, but irrigation was used and the fluid intake was 7 pints daily. Series F was treated the same as E, but sulfapyridine was stopped after three days (18 Gm). The best results followed doses of 1 Gm of sulfapyridine at intervals of four hours over a period of four days. Urethral lavage and a high fluid intake were of benefit in reducing the number of failures, the time necessary for clinical cure, the rate of early relapse and the incidence of acute complications during and after chemotherapy.

Pellagra's Progress A R R Mears—p 147

**Thirst at Sea—Sea Water Enemas**—Foy and his associates point out that many shipwrecked sailors and pilots are exposed to thirst at sea and their suffering has stimulated ideas of alleviating thirst either by rectal administration or by some chemical modification of sea water. Sea water enemata of from 800 to 1,200 cc were given daily to 3 fasting volunteers deprived of all fluid for a period of eighty hours, 3 similar volunteers, also fasting and deprived of all fluids, served as controls. There was no difference between the two groups with regard to clinical signs of dehydration and hemoconcentration, as shown by increased hemoglobin, red cell count, packed cell volume and serum proteins. Sea water is undoubtedly absorbed from the rectum, as shown by the higher blood and urine chlorides and the enormously increased output of total urinary chlorides. The output of urine in the sea water enema group was also increased, being 2,000 cc per person daily and in the control group 1,400 cc per person daily. This higher urine output does not indicate an improved water balance in the sea water group but merely a salt diuresis (osmotic diuresis), indicating a withdrawal of fluid from the tissues in order to excrete the increased concentration of solutes. The greatly increased osmotic pressure (solute concentration) of the fluid in the renal tubules would further tend to decrease reabsorption and thus increase urinary output. It follows that the

increased urinary output in the sea water group is probably from enforced tissue dehydration and/or cutting down of tubular reabsorption. The sea water group further lost on an average of 10 pounds (4.5 Kg) in weight per person, as compared with 6 pounds (2.7 Kg) in the control group, a further indication of tissue dehydration. The authors are of the opinion that sea water, although absorbed from the rectum, is of little or no value in maintaining the body's water balance and is possibly even harmful in that it enforces tissue dehydration and causes the kidney maximal work, as shown by the lumbar pain in 2 of 3 of the sea water group. Ship's biscuits were found impossible to eat after the first twenty-four hours and the authors feel that some improvement in this form of diet is needed. "Life saver" sweets (lime flavored) were acclaimed by all the volunteers as of great value in allaying subjective sensation and oral discomfort.

**Sulfonamide Resistant Pneumonia**—According to Gsell and Engel, failures in treatment of pneumonia with sulfapyridine and sulfathiazole are rare. Failures are due to late or inadequate medication or to coexistence of other serious disorders such as valvular lesions, myocardial defects, carcinoma or bleeding ulcer. True resistance to sulfonamides is extremely rare. Although resistant pneumococci can be produced experimentally, clinical proof of such resistance has not been furnished. Failure of the therapy is due to lack of resistance on the part of the patient's organism and not to sulfonamide resistance of the bacteria. The authors describe 7 cases of highly febrile pneumonia that failed to respond to large and prolonged doses of sulfathiazole. These patients presented several aspects in common that may be regarded as clinical characteristics of sulfonamide resistant pneumonia: (1) a sharp contrast between the mild physical and severe roentgenologic changes of the lung during the first days of high fever; (2) severe toxicity; (3) absence of leukocytosis during the fully developed stage of pneumonia; (4) severe irritative cough with or without expectoration; (5) absence of pneumococci from the sputum; (6) endemic and infectious occurrence (familial and military epidemics). These atypical pneumonias also have certain negative aspects such as absence of eosinophilia. Inadequate dosage was not responsible for the therapeutic failure in these cases. The authors think that the sulfonamide resistant, benign, leukopenic pneumonias represent a special group of atypical pneumonias the clinical characteristics of which seem to indicate a uniform etiology. Recent American reports suggest that they may be virus pneumonias.

**Transplantation of Hypophysis in Hypophyseal Cachexia**—Marti points out that atypical forms of hypophyseal cachexia are more frequent than the typical forms. Curschmann has differentiated four atypical types. The diagnosis of hypophyseal cachexia is difficult because it is not thought of. It differs from cancerous cachexia chiefly by the atrophy of the

genitalia and by the lack of pubic hair. Latent tuberculosis, arteriosclerotic cachexia and thyrotoxicosis are other conditions which must be ruled out. Because emaciation is the outstanding symptom, forced feeding and insulin cures have been tried. The only therapy, however, that promises results is substitutional hormone therapy. Various preparations of the anterior pituitary have been used with some success. When the adrenals seem to be involved, adrenal cortex extracts are advisable. The hypophyseal substitution therapy can be combined with ovarian preparations. The most severe cases are often refractory to this therapy. For such cases intra-abdominal transplantation of hypophyseal tissue from calves has been recommended by Bergmann, Kylan and Curschmann. The author reports the history of a woman, aged 37, who had a severe form of hypophyseal cachexia. In this patient a freshly obtained veal hypophysis was sutured to the omentum and two other veal hypophyses were sutured directly to the peritoneum. The post-operative course was uneventful except for a small abscess. Following the operation the appetite and the psychic state of the patient improved greatly and the weight increased. The condition was not cured but was considerably improved.

- \*Action of Sulfanilamide Spray on Bacterial Flora in Bronchopulmonary Suppuration M. R. Castex, E. L. Capdehourat and E. A. Pedace —p. 5

**Sulfonamide Spray in Bronchopulmonary Suppuration**—Castex and his collaborators report studies of sputums of a large group (exact number unstated) of patients with bronchopulmonary suppuration before and in the course of treatment with sulfonamide sprays. The group included patients with pulmonary abscess. Two or four daily sprays were administered for several consecutive days. A spray contained 20 to 25 cc of isotonic sodium chloride solution or distilled water with 5 cc of 5 per cent azosulfamide. The first examination was performed on the second day of the treatment; the examinations being repeated once a week. Stained smears of sputum obtained before treatment showed abundant bacteria and absence of phagocytosis. Streptococci, staphylococci and pneumococci predominated in the sputum in the acute cases. Forty-eight hours after beginning of the treatment the number of bacteria in the sputum was diminished and phagocytosis increased. Phagocytosis was selective for azosulfamide stained particles. As the treatment progressed, the number of bacteria in the sputum diminished and phagocytosis increased. In some cases in which early treatment failed, blood transfusion or the administration of autovaccines or heterovaccines stimulated the response. In other cases abundant extracellular bacteria temporarily reappeared after intrabronchial instillation of iodized oil, after development of a catarrh or when the treatment was discontinued before a cure was obtained. Sulfanilamide spray failed to affect the sputum when the pneumococcus was the predominating micro-organism. Diminution of sputum and of bacteria was paralleled by regression of the disease. When a cure was almost complete the sputum was almost normal. Endothelial cells filled with streptococci and occasional extracellular bacteria were observed in the microscopic fields. The sputum was normal in amount and quality when the cure was complete. The bacteriostatic effect of sulfanilamide is greater when the drug is administered by spray rather than by mouth or by injection. The drug when in contact with suppurating pulmonary tissue in high concentration alters the metabolism of bacteria and controls their toxicity and growth. It stimulates local phagocytosis, local and general defense forces of the body, production of antibodies and the function of the reticuloendothelial cells.

- Regional Ileitis G. Hadfield —p. 333
- \*Nonsurgical Cholangiography. New Method for Examination of Biliary Tract M. Royer, A. V. Solari and R. Lottero Lanari —p. 368

**Nonsurgical Cholangiography**—The method described by Royer and his collaborators is as follows: A laparoscopy is performed during which the gallbladder is observed. Twenty

five cc of a solution of hexamethyldiamino-isopropanol diiodide is injected into the gallbladder with a special apparatus. Roentgenograms are taken before and after evacuation of the gallbladder with a Boyden meal. Nonsurgical cholangiography enables one to observe the behavior of the gallbladder and of the bile ducts during evacuation of the opaque mass and to make a diagnosis of several diseases of the biliary tract. In almost all cases the gallbladder shows uniform contractions without any waves of the peristaltic type. It forms rings which simulate haustra. Bile is evacuated during contraction into the common bile duct. The bile passes into the hepatic duct and its branches high up into the liver. Contractions of the common bile duct during evacuation of the gallbladder and the cystic sphincter described by Mirizzi are not observed. The method is of value in the diagnosis of cholecystitis, pericholecystitis, dilatation of the gallbladder from obstruction of the bile ducts, biliary lithiasis and to some extent in lithiasis of the common bile duct.

Seborrheic Dermatitis and Diathesis in Infants R. Quera —p. 169

\*Bronchopneumonia in Infants G. Cardelle Penichet, F. Borges Hernandez and B. Duran Castillo —p. 197

**Bronchopneumonia in Infants**—Cardelle Penichet and his collaborators studied 98 cases of bronchopneumonia in infants. Seventy-three of these were undernourished. The disease occurred in two seasonal outbreaks with the greatest incidence in April and September. It was primary in 62 cases and complicated measles, gastroenteritis and whooping cough in the remaining cases. The largest number of cases in the group corresponded to ages between 4 and 12 months. Symptoms most frequently observed in order of frequency were fever, disorders of the respiratory tract and gastrointestinal and nervous disturbances. The clinical types most frequently observed were bronchopneumonia with disseminated foci and pseudolobular bronchopneumonia. There were a few cases of pseudotuberculous bronchopneumonia and of capillary bronchitis. In patients under 6 months of age there was a moderate leukocytosis with acute deviations of the nuclear index to the left, which was not observed in older infants. Roentgenograms taken in 58 cases showed diffuse bronchopneumonia with disseminated foci in 12 cases, local (pseudolobar) foci in 25 cases and hilar, perihilar bronchial and peribronchial types in 13. Purulent pleurisy, suppurative otitis media, anemia and purulent meningitis were frequent complications. Pneumococci, staphylococci, Hemophilus influenzae, streptococci and tetragenic bacteria in combination were present in several cases. Recovery took place in 8 of 25 who had nonspecific treatment, in 18 of 36 who had specific serums and antigens, in 3 of 7 who had sulfanilamide after administration of antigens and serums and in 18 of 30 who had sulfanilamide alone. Best results followed administration of sulfanilamide and blood transfusion. A diet rich in vitamins is important. Mortality was highest among the youngest patients and patients with capillary bronchitis. Mortality amounted to 68 per cent for patients who were given nonspecific treatment, to 50 per cent for patients given specific treatment and to 40 per cent for those treated with sulfanilamide.

\*Pemphigus Foliaceus (Fogo Selvagem) and Gonadal Disorders J. Paulo Vieira, J. Ricardo Guimarães and Benedictus Mario Mourão —p. 125

**Pemphigus Foliaceus**—Paulo Vieira and his collaborators report observations on gonadal disturbances in two groups of 35 and 37 adult men, respectively, who suffered from pemphigus foliaceus. In the first group, 12 patients had a cryptorchism while 24 exhibited hypogonadism. In the second group, 27 patients were impotent, 5 had azoospermia and 4 had oligospermia. The only patient with normal sperm suffered from a benign type of the disease. His limbs were of the eunuchoid type. A regression of the disease occurred in 3 patients with oligospermia. The sexual function became normal as the disease regressed. The testicle descended in the 12 patients with

retained testicle after three injections of 5 mg each of testosterone. The descent of the testicle did not have any effect on the course of the disease. The author believes that there are two testicular hormones, insufficient production of which is the predisposing factor in the development of pemphigus foliaceus. The disease possibly may be controlled by removing the various associated endocrine disorders.

Acute Coronary Syndrome F. Rodriguez —p. 69

\*Action of Digitalis by Intravenous Route on Arrhythmia from Excitability D. M. Gomez Gimeranez, C. F. Gomez and G. Gomez and del Rio —p. 101

**Digitalis in Arrhythmia**—Gómez Gimeranez and his collaborators direct attention to the danger of intravenous injections of quinine and quinidine in the treatment of arrhythmia. These injections may cause sudden collapse. Intravenous injections of physostigmine and geneserine have several contraindications. The authors report good results from intravenous injections of total digitalis (injectable Digalen-Roche) in 7 cases of arrhythmia not associated with cardiac insufficiency. The number of previous attacks varied in the several cases between three and ten, with a duration of from three days to one month. The interval between the attacks varied from several months to eight years. The patients complained of sudden transient acute pain in the precordial region at the beginning of the attack. Diagnosis of the type of arrhythmia was made by the electrocardiogram. The various types of therapy commonly employed for the control of arrhythmia failed in these cases. Paroxysmal tachycardia was observed in 5. It was of either the infranodal or supranodal type with a frequency of about 180 to 200 heart beats per minute. The attack was controlled by one intravenous injection of digitalis in every case. There was a recurrent attack several months later in 1. This attack was likewise controlled by one intravenous injection of digitalis. Auricular flutter was observed in 2 cases. In 1 in which attacks lasted one month the condition was controlled by five intravenous injections of digitalis administered at intervals of twelve hours. In the other, a case of auricular flutter, the attack persisted after administration of fifteen intravenous injections given at twelve hour intervals. The heart rhythm became normal after administration of quinidine given by mouth in a daily dose of 1.5 Gm up to a total of 10 Gm. There appear to be no contraindications to intravenous injection of total digitalis. The treatment is well tolerated.

\*Silicosis and Silicotuberculosis in Coal Miners R. Jalon Lasserre —p. 379

Clinical Study of the Syndromes of Tuberculous Intoxication D. I. Gonzalez Rubio —p. 422

**Silicosis and Silicotuberculosis in Coal Miners**—Jalon Lasserre presents an extensive review of the various aspects of silicosis and a discussion of association of tuberculosis with silicosis. His studies were made on 247 coal miners who had worked in the mines for more than five years. He detected 59 cases of silicosis (44 of pure silicosis and 15 of silicotuberculosis). He classifies the workers into three groups according to the type of work they performed. The first group of 104 workers included men performing various types of work. The second group of 67 workers included coal cutters. The third group included 76 men who were drillers and cutters of rock. Anthracosis may develop in coal cutters who have been working in mines for a sufficient length of time, but it does not seem to produce characteristic roentgenologic changes or a special symptomatology. In coal miners who by the nature of their work are subjected to constant and prolonged inhalation of coal dust (coal cutters) the development of pulmonary silicosis seems to be retarded or attenuated. The incidence of silicosis among coal miners deserves attention only among the drillers and cutters who work on rock and in miners who have worked inside the mine for many years (more than 30 in the author's cases). The incidence of silicosis, as well as its severity, is

directly related to the length of exposure to the harmful mine dust (stone dust). The incidence of silicosis and silicotuberculosis is greater in the asthmatic type. Anatomic defects or chronic pathologic processes of the upper air passages particularly of the nose and the pharynx, greatly favor the early appearance of silicosis. The incidence of tuberculosis is not greater among the coal miners of the Asturias than among the male population who are not miners. The incidence of tuberculosis appears to be less among the coal cutters than among the other workers active inside the mines. The sedimentation speed of the erythrocytes is normal in the majority of cases of simple silicosis and is only slightly accelerated in some, this contrasts with cases of silicotuberculosis, in which it is nearly always greatly accelerated. Speed of sedimentation is of great value together with the clinical and roentgenologic data in the establishment of a differential diagnosis between silicosis and silicotuberculosis.

Bronchography with Leroux's Simplified Permeal Technique M Espinoza Galarza—p 142

\*Opaque Pneumothorax J Descalzo—p 151

**Opaque Pneumothorax.**—According to Descalzo, opaque pneumothorax is rare. The condition is seen in the course of artificial pneumothorax. The roentgen picture was first described by Cardis and Bourguignon in 1931 (*Arch med-chir de l'app respir* 6 422, 1931). It consists in a uniform intrapleural opacity which is in contrast with the clear shadow given by the collapsed parenchyma of the lung. During fluoroscopy a false impression of the disappearance of a large zone of the lung parenchyma is obtained. If the patient is asked to take a deep breath, the border of the collapsed lung can be observed on the screen. In the 2 cases reported by the author opaque pneumothorax was due to the presence of a parietal pachypleuritis with pleural adhesions and emphysema of the collapsed pulmonary parenchyma. In the course of air insufflations the air space exhibited a tendency to progressive diminution. In 1 of the cases the roentgen image of opaque pneumothorax which appeared in the course of artificial pneumothorax disappeared later on. It was followed by appearance of a normal roentgen image of artificial pneumothorax. In this case artificial pneumothorax resulted in complete healing of the tuberculous lesions which did not reappear when the pneumothorax disappeared.

Action of Phrenicectomy in a Patient with Parahilar Pulmonary Tuberculosis J Armando Sciuto—p 100

\*Calcifications and Their Significance in Reinfection with Pulmonary Tuberculosis A Sarno and A C Artagaveytia—p 104

Results of Tuberculin Patch Test in Children and Adults with Tuberculous Lesions P Cantonnet Blanch H Mourigan and J A Radice—p 118

**Calcifications and Reinfection in Pulmonary Tuberculosis.**—Sarno and Artagaveytia discuss the relation of calcification of pulmonary or lymph node tuberculous lesions and tuberculous reinfection. They had studied four thousand chest roentgenograms of persons between the ages of 15 and 60 years and five hundred chest roentgenograms of children. Calcifications were noted in 144 adults (36 per cent) and in 50 children (10 per cent). Pulmonary tuberculosis was present in 81 adults whose roentgenograms exhibited calcifications. The exudative were the most frequent types of reinfection observed (50.6 per cent). Productive forms in reinfection were seen in 23.4 per cent. Apical calcifications were accompanied by pulmonary tuberculosis with greater frequency than those at any other pulmonary or lymph node site. Calcifications are more frequent in children than in young adults, and more frequent in the latter than in older adults. Girls and women exhibit a greater tendency to the formation of calcifications than do boys and men. The authors believe that the larger number of cases of reinfection are nothing more than cases of reactivation of calcified foci of primary infection.

Modern Treatment of Epilepsy T von Lehotsky and A Dobos—p 849

Treatment of Hepatic Diseases with Liver Extracts J Schifferer—p 856

\*Rare Cause of Duodenal Occlusion Internal Retroduodenal Hernia I Fagarasanu—p 857

Read's Formula for Basal Metabolic Rate in Insulin Therapy D T Dimitrijević—p 861

**Internal Retroduodenal Hernia.**—Fagarasanu reports a man, aged 38 who was operated on for duodenal occlusion. The closure was caused by an internal hernia, a jejunal loop becoming incarcerated in a deep peritoneal depression located behind the horizontal part of the duodenum to the left of the mesentery. This depression, bounded on the right and left by peritoneal folds was discovered in 1893 by Jannet in 2 cadavers and was described as recessus retroduodenalis or recessus retroduodenopancreaticus. The case is noteworthy because this localization has never been mentioned in the literature. The hitherto reported duodenal hernias concerned those into the superior, inferior or paraduodenal recesses. The recessus retroduodenopancreaticus, like the other periduodenal recesses, is the result of an incomplete adhesion of the duodenal peritoneum. Under certain conditions a loop of the small intestine can slip through the opening behind the duodenum and under the pancreas and thus produce a retroduodenopancreatic hernia. The resulting symptoms are more those of a duodenal closure than of an internal hernia. Since the retroduodenopancreatic recess is comparatively frequent, it may be assumed that these cases are not as rare as the earlier literature seems to indicate. It is likely that occasionally internal hernia is produced by an intestinal loop engaging in this recess but that at the time of the operation a mild pull liberates the incarcerated loop and the hernial aperture is no longer apparent.

Effect of Turpentine Oil on Normal and Hypersensitive Skins I Rokstad and P Bonnevie—p 401

\*Simple Method for Treatment of Scabies in Women T E Ohlin—p 452

\*Ambulatory Treatment of Uncomplicated Gonorrhea with Sulfathiazole with the Two Day Treatment According to Miescher H Pfisterer—p 455

**Treatment of Scabies in Women.**—Ohlin treats scabies by inunctions with xylene, but he recommends this procedure only for women. The xylene is rubbed on by hand. It is applied twice in succession without preparation of the skin in any way. On the following day the inunction is repeated and the clothing is changed. No bath is given. The author employed this treatment in about 40 women and observed no irritations. In only 4 of the cases did the cure have to be repeated. The advantages of the method are that it is short, simple and inexpensive and that it does not stain the clothing. The method can be employed in all uncomplicated cases, even in the presence of scratches, but not in the presence of dermatitis. In men the treatment is not as effective as in women, probably because of the tougher skin. Furthermore, xylene causes intolerable burning in the scrotal region.

**Two Day Sulfathiazole Treatment of Gonorrhea.**—Pfisterer cites results obtained by Miescher and others with the two day sulfathiazole treatment and presents his own experiences with the method. He employed it in the ambulatory manner in 100 of a total of 143 cases of gonorrhea observed at the Zurich polyclinic. The gonorrhea was uncomplicated. The patients were given five times two tablets on each of two successive days. Local treatment was dispensed with. The treatment resulted in a cure in 95 of the cases. The 5 patients in whom it failed were cured by a second course of sulfathiazole. Complicated cases of gonorrhea and those that fail to respond to the first two day sulfathiazole therapy should be treated for four days with continuous doses (four times ten tablets). Local treatment is unnecessary. The complete absence of grave secondary effects, the rarity of complications, the brevity of the treatment and the small doses demonstrate the advantages of the drug and of Miescher's two day method.

## Book Notices

**Textbook of Clinical Parasitology Including Laboratory Identification and Technic** By David L. Belding, M.D., Professor of Bacteriology and Experimental Pathology, Boston University School of Medicine, Boston. Cloth. Price, \$8.50. Pp. 888, with 1438 illustrations. New York & London: D. Appleton-Century Company, Incorporated, 1942.

Many of the treatises on parasitology have had their origin from biologic and academic backgrounds without medical experience on the part of their authors. They therefore lack the physician's approach in the discussions of pathogenesis, prognosis and treatment. This book is a notable exception to these limitations. Its author is professor of bacteriology and experimental pathology in Boston University School of Medicine and a member of the staff of the Evans Memorial Hospital and the Massachusetts Memorial Hospitals. From this dual background of both teaching and practice this book had its origin. It is a finely organized treatise in both text and illustrations as well as in the use of tables and assembled figures, which facilitate comparisons important in diagnosis and in the identification of species. The scope of the book includes the entire range of the parasitic infections of man with more extended accounts of the commoner and most important ones. The topical arrangement of the discussion of each species includes the generic and specific names with authorities and dates, synonyms, disease, history, geographic distribution, biologic characteristics including morphology and physiology, life cycle, pathogenesis including pathology and symptomatology, diagnosis, prognosis and treatment, prevention, epidemiology and prophylaxis. In addition to the forty-two chapters containing the systematic treatment of nearly a hundred different species parasitic in man, and discussions of the larger systematic groups, there are chapters on general subjects such as parasites and parasitism, pathology of parasitic infections, immunity, transmission and technical methods for the diagnosis, treatment and prevention of parasitic diseases. There is a bibliography and indexes of authors and subjects. The text is noteworthy for being up to date in all fields. The style is direct, simple and clear. The work is a model textbook in every particular and a credit alike to its author and the publishers and should be in the library of every physician and clinical laboratory. It is an indispensable work of reference for every biologist.

**Diseases of the Skin** By Frank Crozer Knowles, M.D., Professor of Dermatology, Jefferson Medical College, Philadelphia, Edward F. Corson, M.D., Clinical Professor of Dermatology, Jefferson Medical College, and Henry B. Decker, M.D., Assistant Professor of Dermatology, Jefferson Medical College. Fourth edition. Cloth. Price \$8. Pp. 621 with 272 illustrations. Philadelphia: Lea & Febiger, 1942.

Dr. Knowles and his new collaborators have tried diligently to cram an abundance of information between the covers of a small textbook, but the result is disappointing. To weigh the general data of a subject, to accept the important and reject the immaterial, is a subtle task, demanding a quality of astute discrimination which marks good teachers and good authors. The authors of this revision, however, in a zealous attempt to bring the work up to date, have inserted into the pages indiscriminately, or at least uncritically, abstracts of papers published during the last few years. Many insignificant items are therefore included, but, curiously, a number of really illuminating contributions to the recent dermatologic literature are not mentioned. Several of the shorter sections, dealing with rare conditions, serve no useful function because of their meager outlines and lack of illustrations. In a textbook intended for students and general practitioners it is redundant to include minutiae which often hold little interest even for dermatologists.

The morphologic accounts of most of the major dermatoses, including the syphilids, are well and concisely done. A few classifications are frankly erroneous, such as the listing of lupus vulgaris erythematodes as a rare form of lupus erythematosus, the inclusion of pseudoxanthoma elasticum among the xanthomas, and the designation of pellagra as a manifestation of avitaminosis B<sub>2</sub> (G). Dermatologists will take issue with some of the concepts expressed and some of the factual data, but in general the authors adhere closely to conventional lines.

While the book covers a great deal of ground, considering its size it is unfortunately devoid of freshness and inspiration.

The writing is still painfully awkward in spots, careless, disjointed, unpolished, often ungrammatical. Such editorial laxity in a fourth edition is inexcusable. Prescriptions are given in a hybrid Latin, with improvised endings, casual abbreviations and liberal admixtures of English. It is difficult to understand why, in the absence of intimacy with accurate Latin terminology, the authors have not simply written the formulas in English. A glossary is essential to a book of this scope, and one is lacking. It must be added finally that the index is incomplete.

**The Eye Manifestations of Internal Diseases** By I. S. Tassman, M.D., Associate Professor of Ophthalmology, Graduate School of Medicine, University of Pennsylvania, Philadelphia. Cloth. Price \$9.50. Pp. 542, with 201 illustrations. St. Louis: C. V. Mosby Company, 1942.

There has long been a need for a modern, comprehensive textbook which would consider exhaustively the ocular manifestations of internal diseases. In complete detail, with simple concise style, the author has provided a most excellent contribution in this first edition which would "meet the needs of the ophthalmologist and all others engaged either in general or specialized practice." The first part of the text, including the first five chapters, provides a description of the normal structure of the eye, a general description of the causes of eye manifestations and two chapters devoted to the structural abnormalities and manifestations. The second part presents the essential description of the eye manifestations of a different disease or system of diseases in each chapter. An effort is made to describe all the important features of the ocular condition, as well as the management, treatment and prognosis, and also to include the results of the most recent investigations and references to work of recognized authors. In the "congenital and hereditary manifestations" in a separate chapter is a description of the ocular manifestations found in the more important hereditary and hereditary diseases, in addition to a description of congenital eye malformations and anatomic defects of development. The eye manifestations of infections and the infectious diseases include those of all the acute and chronic infectious diseases, with separate chapters on such important subjects as syphilis and tuberculosis, both of which are excellently considered. The other infections are grouped as "virus infections," "fungus infections," "ocular parasites and parasitic infections" and "focal infections." A separate and detailed chapter is devoted to the eye manifestations of the important drug and chemical intoxications. The succeeding chapters deal with the eye manifestations of nearly every disease from those of the cardiovascular system to the diseases affecting the bones of the skull. The illustrations are adequate and there are nineteen excellent color reproductions. A short bibliography, mainly of American authors, follows each chapter, and an extensive index concludes the work. This textbook is easy and pleasurable to read. It is concisely but adequately presented by an authority on the subject.

**Spontaneous and Experimental Leukemia in Animals** By Julius Fugelbreth-Holm, M.D., Director of the Cancer Research Laboratory of the Danish Anti-Cancer League. Translated from Danish into English by C. L. Heel. Cloth. Price 15s. Pp. 245 with 44 illustrations. Edinburgh & London: Oliver & Boyd, 1942.

This book is published by the Lady Tata Memorial Trust, which since 1932 has supported researches on diseases of the blood, especially leukemia. Contributions have been made by investigators thus assisted in various countries. The manuscript was written in Danish and ably translated into English by C. L. Heel. The introduction deals succinctly with the history and the classification of leukemia. Human leukemia was recognized in 1845, when Bennett described a case of "suppuration of the blood," Craigie reported a case of "purulent matter in the blood" and Virchow published his important observations on white blood ("weisses Blut"). Following Leisner's report in 1858 of a case of leukemia in a horse some reports of leukemia in different kinds of animals, and in 1908 Ellermann and Bang transmitted the disease from leukemic to healthy birds, thus introducing the experimental study of leukemia. The book reviews the accumulated, widely scattered knowledge of spontaneous and experimental leukemia in animals (birds and mammals). The results of the studies of animal leukemia bear directly on the human disease as well as on problems of poultry husbandry. The transmission experiments, the virus of 161

leukemia, the role of heredity in the spontaneous disease and in the transmitted mouse disease and the attempts to produce leukemia experimentally receive thorough and critical consideration. The final chapter deals with the nature of animal leukemia and its relation to leukemia in man. "Altogether there can be no legitimate grounds for doubt that leukemia in animals, especially in mice is the same disease as leukemia in man. The peculiar features presented by the disease in some species especially birds are more reasonably explained as being due to the special characteristics of these species than to the possibility that fowl leukemia for example is a disease of an entirely different nature from leukemia in other animals or in man. With the solution of the problem of human leukemia as the final goal the study of the nature of the disease and of its various features in animals must therefore be regarded as abundantly justified since the results attained are likely at the same time to elucidate the corresponding features in leukemia in man." The book will be of help to any one interested in the advance of our knowledge of leukemia.

**Analysis of Human Motion. A Textbook in Kinesiology.** By M. Clady. Scott. Cloth. Price \$3.90. Pp. 388 with 87 illustrations. New York: F. S. Crofts & Co. 1942.

The mechanics of human motion—kinesiology—is now a required subject in the curriculum in physical education in most universities. Full understanding of the subject would demand a good groundwork in anatomy and in mechanics. Unfortunately the instructor in kinesiology must expect that the majority of his students will have little exact knowledge of anatomy and less of mechanics. Any textbook of the subject therefore must represent a compromise in which difficult details are diluted with elementary facts.

The present book is not exceptional in this regard. Little is taken for granted, and both simple and complex motions are explained in detail. The fact that these explanations are generally clear and intelligible is a tribute to the author's skill in verbal presentation. The author's task could have been simplified—with benefit to the reader—by much more extensive use of illustrations. It must be supposed that full appreciation of the mechanics of many of the motions discussed will need physical reenactment by the instructor.

Most emphasis is given on the action of levers, antagonistic muscles and the position of the center of gravity. Relatively little attention is given to more truly kinetic aspects such as speed of movement and momentum. The section on injuries is short and unadorned with a single illustration. The general treatment frequently gives the impression of verbosity. Even when the facts are unfamiliar the mature reader is apt to resent being reminded of the obvious too often. Though much of the subject matter is of intrinsic interest and is accurately stated, it is likely that few parts of the book would satisfy the average medical student or physician. The fact is of course that the book is not designed for such readers. It may be questioned, however, whether these criticisms may not apply to some extent to the use of the book by physical education students.

Physical education has long been striving for increased academic recognition. There are two directions of development—the pedagogic and the scientific. Thus far the latter has been sadly neglected. Kinesiology would seem to be an ideal subject with which to bring the impact of science to the earnest student of physical education. The merits of the present textbook for this purpose are considerable. Its weakness must be ascribed primarily to the limitations of the general curriculum in physical education.

**Lane Medical Lectures. The Lymphatic System. Its Part in Regulation of Composition and Volume of Tissue Fluid.** By Cecil K. Drinker. Professor of Physiology, Harvard University, Boston. Stanford University Publications, University Series, Medical Sciences, Volume IV, Number 2. Price cloth \$2.25, paper \$1.50. Pp. 101 with 29 illustrations. Stanford University, Stanford University Press, London, Oxford University Press, 1942.

It is only in recent years and in large measure because of the work of Drinker and his co-workers that the neglected field of the physiology of lymph production has again received the attention it deserves. In this concise volume Drinker has attempted "to describe a world never entered by the three-

deckers we call medical texts, one of which I had just helped to perpetrate." In an interesting introductory section the author traces the evolution of the mammalian circulation and the appearance and elaboration of lymphatic vessels. For specific discussion he has selected the formation of lymph as illustrated by experiments on the heart and lungs. Clinicians will be interested in Drinker's interpretations of the role of the lymphatics in such events as the formation of pulmonary edema, pneumoconiosis and the healing of wounds. The book is most readable and combines witness with scholarship of presentation to an unusual extent.

**The Electrocardiogram and X-Ray Configuration of the Heart.** By Arthur M. Master, B.S., M.D., F.A.C.P., Cardiologist to the Mount Sinai Hospital, New York. Second edition. Fabrikoid. Price \$7.50. Pp. 404 with 163 illustrations. Philadelphia: Lea & Febiger, 1942.

To those already familiar with the first edition of this book, great pleasure will come from reading and studying this amplified volume. The work, concerning itself with the correlation of the electrocardiogram and the x-ray configuration of the heart, is an important contribution to the science of cardiology. The comprehensiveness of the volume soon becomes apparent to the reader for no important phase of heart disease has been omitted. The stress placed on normal variations, both in the electrocardiogram and in the x-ray silhouette of the heart, is most commendable because the range of normal so frequently escapes the attention of those using these methods of examination. This lack of understanding leads to many diagnostic errors on the side both of omission and of commission. For instance the author clearly discusses and illustrates the changes occurring in the various periods of life, the changes resulting from respiration changes in position of the body, habitus, and so on. Virtually every pathologic state and combination of pathologic conditions is considered in a logical and orderly manner. In the concluding phase of the book the effects of digitalis are clearly discussed, a subject which continues to need emphasis. The format of the book is excellent, the constant comparison of the cardiac silhouette and electrocardiogram is extremely instructive and the reproduction of the illustrations is excellent. While the difficulty of selecting suitable cases which have been verified by postmortem examination is realized, many of the cases presented in this work would exhibit themselves with greater authority had this been possible. This is particularly true in cases of congenital cardiac defects in which multiple lesions are the rule as well as in chronic cor pulmonale, in which more than one pathologic entity commonly contributes to the ultimate cardiac picture. The book can be highly recommended to all physicians interested in diseases of the heart. It should be carefully studied by every internist and certainly should be an inspiration to the medical student.

**Reaccion de Takata-Ara en el líquido céfalo raquídeo. Contribucion a su estudio.** Por el Dr. Jorge Bulló. Tesis de doctorado. Universidad Nacional de Buenos Aires. Facultad de ciencias medicas. Paper. Pp. 99 with 3 illustrations. Buenos Aires: Aniceto Lopez, 1941.

This monograph, which was submitted by the author as a doctorate thesis to the faculty of medical science of the University of Buenos Aires, deals with a study of the Takata-Ara reaction of the cerebrospinal fluid. The reaction was described in 1926 and consists in the addition of 1 drop of 10 per cent sodium bicarbonate solution to 1 cc. of cerebrospinal fluid, to which is added 0.3 cc. of a fresh mixture of equal parts of 0.5 per cent mercury bichloride solution and 0.02 per cent fuchsin solution. Normal cerebrospinal fluid has a blue-violet color without flocculation. In metasyphilitic conditions the fluid is clear like water with a blue-violet sediment below it. In meningitis there is a rose color to the fluid without any precipitation. The degree of precipitate is indicated as 1 plus to 4 plus. The present study consisted in a comparison of the various qualitative globulin tests, the colloidal gold test and the Wassermann test with the Takata-Ara reaction, the latter having been carried out both in its original one test tube method and in various dilutions. On the basis of a large series of normal and pathologic fluids the author reaches the conclusion that the Takata-Ara reaction is very valuable in the diagnosis of metasyphilis and of meningitis and should be employed routinely in the examination of cerebrospinal fluid.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### LATENT SYPHILIS AND BLOOD TRANSFUSION

**To the Editor**—There seems to be considerable difference of opinion among medical men on the question: Will the Wassermann 4 plus blood of a person with latent syphilis (primary lesion ten years ago), if given by transfusion to a normal person, result in syphilis in the recipient or in a 4 plus Wassermann reaction in the blood of the recipient?

M D, West Virginia

**ANSWER**—There is some difference of opinion as to the safety of the blood taken from a patient with latent syphilis and used for transfusion purposes (Morgan, H J. Factors Conditioning the Transmission of Syphilis by Blood Transfusion, *Am J M Sc* 189 808 [June] 1935). Morgan is rather inclined to think that with late latent syphilis there is not much danger of transmission of the disease.

On the other hand, Klauder and Butterworth (Accidental Transmission of Syphilis by Blood Transfusion, *Am J Syph, Gonorr & Ven Dis* 21 652 [Nov] 1937) have reviewed the subject and state that, since 1915, reports of 33 cases of transfusion syphilis have been published (of course there are hundreds of them that have not been published). In the majority of cases of transfusion syphilis they believe that the donors, in contrast to the view of Morgan, were in the latent stage of the disease. It is true that in latent syphilis the disease is more or less submerged and quiescent, and most of the spirochetes are probably found in lymph nodes, in the bone marrow and perhaps in the walls of small vessels supplying the larger arteries. There is a possibility that from time to time a few organisms may get out into the general circulation and, if this was to happen, naturally the donee would contract syphilis.

It is probably better never to use the blood of a syphilitic person for transfusion purposes, and if this contingency has arisen the patient should be followed carefully for the next eight to ten weeks. If the serologic reaction becomes positive it indicates the presence of syphilis. It is true that a child may be born to a person with late latent syphilis and that the cord blood will show a positive serologic reaction and that later, within a period of two to three months, the serologic reaction may return to negative, indicating that the cord blood Wassermann reaction was simply a reflection of the mother's blood reaction, not necessarily indicating that the child had syphilis. However, the amount of blood that is furnished to a donee would not be large enough to change the serologic reaction, and if such a change has occurred it indicates that this patient has contracted syphilis.

### SO-CALLED DIABETIC CURES

**To the Editor**—One of my patients heard about ragweed leaf extracts as a remedy for diabetes. Have you any information on this subject?

R R Sullivan, M D, Lakeland, Fla

**ANSWER**—Every physician interested in the treatment of diabetes mellitus receives numerous queries from patients regarding "cures" or "substitutes for insulin" or "insulin which can be taken by mouth." There is no specific information regarding the particular leaf extract mentioned in the query. It is, however, but one of hundreds of similar extracts, some of which have been studied in detail and none of which have proved of any practical importance. Whenever such an extract is reported to have helped control diabetes mellitus, it can be safely assumed that its effect has been due to the diet (which usually is prescribed with the nostrum), to a diuretic effect (decreasing the amount of sugar in an individual specimen but not affecting the total excretion) or to other extraneous factors. Wilder recorded that some extracts of plants do have a sugar depressing principle, but they have not proved of practical importance. These were reported by Collip and later by Best and Scott. Myrtillin, an extract of blueberry leaf, was studied carefully, particularly by Allen. Numerous substances of this nature are included in the monograph on insulin by Hill and Howitt. The Chinese, of course, long have studied the effect of plant extracts, some of which are discussed by King and his associates. Another reported plant extract with

hypoglycemic potency is one from the roots of the shrub called "devil's club" (*Fatsia horrida*), which, it is reported has been used for centuries by the Indians of British Columbia.

Guandine derivatives, synthaline and neosynthaline, have been given a thorough clinical trial and have been discarded.

Regarding the administration of insulin, Joslin and his associates have stated that "many methods for the introduction of insulin into the body other than by the needle, subcutaneously or intravenously, have been tried without practical success. Major (*Am J M Sc* 192 257 [Aug] 1936, *Proc Soc Exper Biol & Med* 34 775 [June] 1936, 37 338 [Nov] 1937, 38 721 [June] 1938) has mixed insulin with diethylene glycol monoethyl ether, and when thus mixed it can be introduced by rubbing into the skin in animals with a resultant fall in blood sugar. He has also shown the absorption in 92 per cent of experiments on diabetic dogs in which he has inserted pinacol tablets into the intestinal loop. Hermann and Kassowitz (*Klin Wchenschr* 15 129 [Jan 25] 1936), using animals, and Pribram (*ibid* 14 1534 [Oct 26] 1935), in a group of 20 diabetic patients have demonstrated the percutaneous action of insulin applied in an ointment. All methods of introduction, such as the conjunctival, oral, rectal, vaginal and by inunction, have failed to be clinically useful because large amounts of insulin are required to produce even variable or slight effects on the blood sugar. (A recent report is that of Brahm [*Lancet* 1 829 (May 4) 1940], who studied the effect of insulin suppositories [rectal] on the blood sugar of rabbits and normal persons. He found that the action sets in quickly, attaining its maximum in thirty to forty minutes, the duration of effect is from one to two hours. He quotes Wuhrmann [*Schweiz med Wchenschr* 69 35, 787, 1939] as finding that one suppository unit is equivalent to about ten injection units.)

"Insulin is a protein and as such is broken down by the digestive juices of the stomach and intestine. When this happens, potency is lost. Preparations on the market claiming to control diabetes when taken orally are, by and large, quack medicines, and advertisements of such products are barred from reputable medical journals. To date insulin administered subcutaneously is the only agent available which affords treatment specific for diabetes.

"Although attempts to date to secure absorption of insulin from the gastrointestinal tract have been unsuccessful from a practical point of view, much has been done in the way of investigation with this in mind. Murlin and his associates (*Am J Physiol* 126 P480 [July] 1939) have for years carried out studies with the object of finding some way in which to protect the insulin molecule from the destructive action of the digestive juices and to facilitate its absorption through the intestinal wall. These and other workers have found that in general there are three classes of substances which are effective: (1) alkyl derivatives of resorcinol, (2) glycol derivatives and (3) sapogenins. Favorable effects seem to depend in part on surface action (the resorcinols and the sapogenins lower surface tension) and in part on the presence of hydrophilic and hydrophobic groups. Calcium reduces intestinal permeability, consequently agents such as sodium hexameta phosphate which combine with calcium favor absorption. The most recent report of the Rochester workers (Murlin, Gibbs, Romansky, Steinhausen and Truak, *J Clin Investigation* 19 709 [Sept] 1940) describes their results with an insulin hexylresorcinol mixture given to 20 human patients with diabetes. They characterized their findings as 'only mildly encouraging'.

"Wilson, Sappington and Salter (*Endocrinology* 23 535 [Nov] 1938) have shown that the inactivation of insulin by proteolytic enzymes in vitro may be reversed in whole or in part. Under the conditions of their experiments, the oral administration of insulin preparations caused hypoglycemic coma or convulsions in mice within two hours after administration. The effective oral dose for 'undigested' insulin was about ninety times, and for 'digested' insulin about forty-five times, the subcutaneous dose. Iron salts increased the effectiveness of insulin preparations given orally.

"Insulin is effective when injected subcutaneously, intravenously or (as found in animal studies) intraperitoneally. Absorption from the rectum, vagina and skin is incomplete and uncertain. It has been reported that intratracheal application produces hypoglycemia though not so regularly as do hypodermic injections. The literature regarding these unusual modes of administration has been summarized by Jensen (*Insulin: Its Chemistry and Physiology*, New York, Commonwealth Fund, 1938).

It should be stated that at this time the only successful treatment of diabetes mellitus is based on prescribing the proper diet and the injection of insulin when it is necessary.

lives are lost when patients are encouraged to rely on "diabetic cures." It is true that these nostrums and extracts probably do not cause any harm to a patient suffering from mild diabetes (although they do no good), but they account for deaths, particularly when prescribed for children whose lives require the intelligent use of insulin by injection.

#### INHERITANCE OF SKIN COLOR

To the Editor—A small percentage of the men in the armed forces stationed in Trinidad are marrying native girls. The girls they are marrying are white in appearance. They are a mixture of English, Spanish, French and Portuguese with from one sixteenth to one thirty-second Negro. The men in question are 100 per cent occidental. This brings up the question as to whether a child born of such a marriage could be black. If so what are the mathematical possibilities of such a thing happening?

M D Trinidad British West Indies

ANSWER—The inheritance of skin color has been studied by Pearson (*Biometrika* 6 346 1909) Davenport (Pub 188, Carnegie Institution of Washington 1913) and Barnes (*Human Biol* 1 321, 1929) and their results are summarized by Lewis (The Biology of the Negro (Chicago University of Chicago Press 1942). The principal question involved in these studies is whether or not skin pigmentation is inherited according to mendelian law. Pearson was of the opinion that the inheritance is by blending, since skin color is not segregated in the offspring of mixed parents in the manner that he believed was called for by mendelian law although it is obvious that he had in mind what is today known as one factor mendelian heredity. Davenport pointed out the probability that two factors are involved. He tested this hypothesis by a study of the pedigrees and skin colors of one hundred and six different families in Bermuda, Jamaica and Louisiana in which there were Negro-white crosses. From an analysis of his data concerning the color of offspring in the second generation he established five grades of color representing seven different genotypes. The full blooded Negro was given the gametic formula *AABB* (two double factors for black) and pure Caucasian was given the formula *aabb* (absence of factors for black). The gametic formula *Aobb* was assigned to light colored individuals *AAbb* or *AaBb* to the medium colored and *AABb* or *AaBB* to the dark colored. Davenport further showed that with his five grades of skin color there are twenty-six possible matings between them. If the matings are considered to be between genotypes instead of between grades of color and if the genotypes *aaBb* and *aaBB*, which he omitted, are included, there are eighty-one possible matings between the nine genotypes. Davenport presented data relative to seventeen of the possible matings and showed that the actual occurrence of color grades among the offspring closely approximated that predictable by mendelian two factor heredity. Among his findings was the observation that white fathers (*aabb*) and light colored mothers (*Aabb* or *aABb*) in twenty-two such matings produced fifty-six children of the same grade of color as the white parent, eighty children of the same grade of color as the colored parent, and one child darker than the colored parent. In the second or subsequent generations of mixed matings, skin color may be completely segregated so that among the offspring can be found individuals with skin color identical with that of pure Caucasians or pure Negroes. These so-called extracted whites or extracted Negroes will breed true when crossed with similarly extracted mates of the same color or with pure bred mates of the same race. Davenport also investigated in Jamaica the popular belief that black

children might be born to a purebred white married to an extracted white. Replies received to inquiries concerning this happening agreed in holding the idea of "reversion to black" to be mythical. He thought it might have arisen from the fact that two very light colored persons can be the parents of a medium colored child. It is improbable, from Davenport's findings, that factors for black are contained in the genes of a person who is one sixteenth or one thirty-second Negro, representing the third or fourth generation after the Negro-white cross, provided the mating at each generation was with an individual with no factor for black.

#### PAINFUL GUMS FROM DENTURE

To the Editor—I am wearing a complete lower denture. The teeth were extracted several months ago. Healing has been complete for a long time. The denture fits well yet the gums are tender and painful while I am wearing the denture. The upper denture is worn with ease, as the upper gums are not sensitive. Can you suggest some local application that might harden the lower gums and give me the comfort of the upper? The suggestions of our local dentist do not overcome the condition. Hardening of the gum tissue would be the solution. M D South Carolina

ANSWER—The condition of the gums as described may be due to a slight malocclusion of the teeth resulting either from a change which may have occurred since the placing of the lower denture or the acceptance of an incorrect record of the positional relation of the lower jaw.

The unbalanced occlusion produces localized excessive pressure, this in turn traumatizes the mucosa or gum tissue.

There are two corrective treatments that may be employed. The first is a new registration of the position of the lower denture in its relation to the upper, a remounting of the denture followed by a diagnosis of the type and magnitude of the malocclusion and its correction by spot grinding and milling in with an abrasive paste.

The second is a relining and rebasing of the lower denture and the correction of the malocclusion by transposing the lower arch on the new model cast into the reline impression. This also calls for a mounting on an adjustable articulator.

There is no effective treatment for hardening gums. Rinsing the mouth with salt water helps to alleviate soreness.

#### SCLEROSING SOLUTIONS

To the Editor—Please inform me as to what material is now considered the best agent for sclerosing veins.

W D Bretz M D Huntingburg Ind

ANSWER—No single solution fits all situations. Fifty per cent dextrose solution is safest for the fine spider bursts. A mixture of 50 per cent dextrose and 20 per cent sodium chloride has given the best results in injecting the distal stumps of ligated veins. A whole group of oleates is available for segmental injection of large or medium sized varices, of these, potassium oleate in 5 and 10 per cent concentration has proved to be a stable, dependable drug. Sodium morrhuate produces sensitization reaction more often than the others. Quinine and sodium salicylate are quite caustic and produce sloughs more easily. The amount of solution used must be adapted to the size of the vein and to the reactivity of its wall, which must be tested by small preliminary doses in patients suspected of harboring latent infection.

#### DENTURES AND DERMATITIS

To the Editor—A patient has been using a mixture of acetone in the making up of dentures in a dental laboratory. He has had from time to time a rash on the hands with peeling. At the present he has a rash on the back which is better when he is away from work a few days. Do you think the acetone could be the irritating factor and if so are there any suggestions for treatment which do not consist of changing occupation?

M D, Wisconsin

ANSWER—Acetone causes comparatively little in the way of eruptions on the skin. The compounds from which the dentures are made would in all probability prove to be a greater source of irritation. An article by Dr Everett S Lan appearing in the *Archives of Dermatology and Syphilology* in January 1932 itemizes the number of substances in material used for dentures. Undoubtedly others have been developed since this article was written. The patient should have some patch tests made with the various substances with which he is coming in contact, these tests to be made by a competent dermatologist in an endeavor to determine the exact agent if it is possible to do so. With this information, possible preventive measures could be developed. Such measures would depend entirely on the substance found, and some such program should be followed before giving up one's occupation.

## PROBABLE DYNAMIC ILEUS

To the Editor—A white woman aged 49 complains of severe attacks of pain in the epigastrium of eight years' duration, accompanied by severe nausea and vomiting. Attacks come on at intervals of one week to three months. They last usually twelve hours but have lasted as long as five days. Intravenous dextrose solution has been necessary on several occasions because of dehydration caused by vomiting. Pain and nausea do not appear to be influenced by medication. As much as 1 grain (0.065 Gm) of morphine, 1/50 grain (0.001 Gm) of scopolamine and 6 grains (0.4 Gm) of soluble pentobarbital were given over a twenty-four hour period with practically no relief. After the attack is over, the patient appears entirely well and is free from any symptoms until the next attack appears. Menses have been normal and still appear at intervals of twenty-eight days. She is the mother of two children aged 18 and 24. She is frail, weighs 110 pounds (50 Kg), is 5 feet 5 inches (165 cm) in height, her blood pressure is 110 systolic and 80 diastolic, her abdomen is negative to palpation and her reflexes are hyperactive. The hemoglobin is 12 Gm and the urine is normal. X-ray examination is negative for disease of the gastrointestinal tract. Repeated roentgenograms of the gallbladder with dye have been essentially negative. Examinations by a neurologist were negative for organic disease. Genitourinary examination by a urologist was negative. A surgical consultant did not recommend an exploratory laparotomy. Recently the attacks have come on more frequently and have caused the patient to lose a good position where she had been employed for the past five years. The last attack awakened her from a sound sleep. Dieting with the Rowe elimination diet for allergy gave essentially negative results. At present she is getting a proprietary preparation for the control of autonomic nervous disorders, which does not appear to have any effect on the occurrence of the attacks. What is your advice as to further conduct of this case?

M D, Tennessee

ANSWER—From the story of severe attacks of pain in the epigastrium accompanied by nausea and vomiting occurring at increasingly frequent intervals with complete relief of symptoms between attacks, one is forced to conclude that the condition is probably a functional one. The fact that all laboratory examinations reveal normal findings between attacks would substantiate this contention. One must in such a case rule out, of course, a spinal cord lesion, such as tabes, because in such an instance irritative lesions of the cord can give rise to similar symptoms. Certainly a lumbar puncture and examination of the spinal fluid are in order, although the negative examination by the neurologist would tend to rule this out. The most likely condition is that the patient has a dynamic ileus, resulting from severe spasm of the gastrointestinal musculature, a condition which occurs relatively infrequently but which has been repeatedly observed and for which frequently patients are operated on. Occasionally such attacks are precipitated by a sensitivity to tobacco, and, if the patient does smoke, it would seem desirable that she refrain from it. Because the attacks appear to be of a spastic nature, it would seem highly desirable to continue the use of the antispasmodics and during the attacks to use more drastic ones, such as glyceryl trinitrate.

## PULSATING FONTANEL

To the Editor—The anterior fontanel of my 4½ month old baby shows a barely visible pulsation when it is closely observed, it is more obvious when the child holds her head still and it is palpable, its rate of pulsation is roughly equal to the pulse rate. The measurements of the child's head are within normal limits, and the head does not appear disproportionate in size or shape. The child seems bright and normal for its age. There is a moderate incoordination of the eye movements. The child appears cross eyed at times, this condition has been present since the child was a few weeks old and consists in an inability to rotate the right eye completely externally (about 15 degrees) and the same eye is rotated about 10 degrees too far with medial rotation. The eyegrounds are not visualized. At the birth of the patient there was frank breech presentation (extraction and forceps on the aftercoming head) and the duration of labor was nineteen and one-half hours. There was no apparent undue trauma during delivery, but far one week after delivery the child had a transitory paresis of the right leg, which completely cleared up after ten to fourteen days. The following information would be greatly appreciated: 1. Is it normal to notice a pulsating fontanel in an infant at this age? If not normal, what investigation would be indicated? What conditions might cause this? 2. What significance would an attack to the eye condition? How soon would an eye examination be indicated? 3. Is a weight of 14 pounds (6.4 Kg) in an infant this age, whose height is 26 inches (66 cm), normal?

M D, California

ANSWER—1. The pulsation of the fontanel is due to the systolic impulse in the superior longitudinal sinus and is often seen in the normal infant as long as the anterior fontanel is open.

2. The eye condition described probably indicates a partial paresis of the right external rectus muscle. This often results from injury to the sixth nucleus at birth, most probably due to hemorrhage into or near the nucleus. In many cases normal function returns spontaneously within the first two years. Covering the good eye for one hour daily exercises the weak muscle and is generally recommended during infancy. No other treatment is indicated until the vision in the affected eye can be measured, which is at about 2 years of age. It seems probable that the paresis of the right leg was peripheral in origin and has no connection with the eye condition.

3. Fourteen pounds is the average normal weight of a 4 months baby. Twenty-six inches is higher than normal.

## SUBMAXILLARY MUMPS

To the Editor—My wife's sister teaches in a kindergarten in which there have been several cases of mumps. Several weeks ago she was taken ill with what her physician diagnosed as mumps, although the systemic symptoms were mild and the swelling mostly limited to the submaxillary glands. The day before the swelling appeared my wife and 2 year old boy intimately associated with her. Just two weeks after this single contact my wife complained of headache, malaise, slight fever and definite enlargement and tenderness of both submaxillaries. There was no parotid involvement, pharyngitis or cervical adenitis. Two days later I too developed a left submaxillary adenitis with definite though moderate swelling and tenderness. Is this a true "specific" submaxillary infection by the virus of specific parotitis? Is it often that the virus attacks the submaxillaries to the exclusion of the parotids or is this a peculiar "strain" of the virus? Neither of us had had mumps. Will this insure us of permanent immunity? In the absence of any symptoms of ovarion involvement is it still advisable to continue bed rest until complete subsidence of adenitis? My son so far has shown no symptoms. At what age does the natural immunity disappear?

M D, New Jersey

ANSWER—Apparently a submaxillary infection, as described, was due to the virus of epidemic parotitis. It is not a great rarity to see submaxillary mumps without apparent swelling of the parotid glands. Involvement of the submaxillary glands due to infection with the virus of mumps should establish immunity against the common form of epidemic parotitis. Notwithstanding this fact, patients frequently give histories indicating a unilateral attack of mumps, first on one side and several years later on the other.

There is no doubt that the patient should remain in bed until there is complete subsidence of the adenitis.

Mumps is uncommon under 2 years of age and is almost unknown under 1 year.

## DISTURBANCE OF LACRIMATION

To the Editor—A man aged 45 complains of a constant feeling of dryness in his eyes. The Schirmer test reveals a normal amount of lacrimal secretion. The appearance of the lids is not abnormal, and two careful checks on refraction and state of the muscles have been done with negative results. At times he has gushes of tears, which run down over the cheek and cloud his vision. These are usually not bilateral but only of one eye or the other. One such episode was brought on while using his eyes intently through a magnifying glass. Is there any specific syndrome or reflex which causes this momentary lacrimal increase, or any parasympathetic drugs that may be used in an effort to control it?

M D, Oklahoma

ANSWER—It is possible that the patient has some small corneal lesion, such as a small recurrent erosion, which might account for his symptoms. The sudden flow of tears in such a case might occur when the eye is held in a certain position which exposes the denuded area to the pressure of the lids. In such cases usually there is pain on awakening in the morning. A careful slit lamp examination after staining with fluorescein would reveal such a condition, if it is present. If such a finding is made, the use of olive oil at night and some ethyl morphine hydrochloride in increasing concentration might give relief. Even if no epithelial lesion is found, the use of ethyl morphine hydrochloride might give relief. There is probably a certain functional element present and every attempt ought to be made to reassure the patient that the attacks of lacrimation will have no deleterious effect on the sight. It might even be necessary to go into the history with the possibility of a psychoneurosis. No drug is known which is likely to have much effect on the secretion of the lacrimal gland in the direction of lessening it, although atropine, systemically, might possibly do so.

## INTRAPROSTATIC INJECTIONS OF MERCUROCHROME

To the Editor—In the March 28, 1942 issue of *Liberty* magazine there is an article entitled "Are Operations Necessary?" by Morris Markey, in which he states that a new method of treating prostatitis has come to light. It consists in injecting mercurochrome into the tissues of the gland. He further states that there have been more than six hundred injections with a complete cure percentage of about 70. What can you tell us about this?

Petersen, Bergmann and Jones, M D, Mattituck, L I, New York

ANSWER—The method of treating prostatitis described in the query is not a new one. As long as forty or fifty years ago drugs of various sorts were injected into the prostate. Solutions of iodine and ichthammol were used at that time. They were discontinued because they failed. Some years ago injections of mercurochrome into the prostate were used with a good deal of enthusiasm and a good deal of publicity. The method has practically passed out of use because it failed to cure the patient. The use of mercurochrome by intraprostatic injections is not of much value.

## THYMUS PREPARATION IN TREATMENT OF CANCER

To the Editor—Will you be kind enough to give me information regarding a thymus extract which is being used in the treatment of advanced cancer? I am informed that this extract is made from 6 week old calves and is being administered intravenously mixed with plasma. The treatment was apparently originated by Dr Maynard Murray of Cincinnati who is connected with the medical school there. Have there been any favorable reports on this treatment in the literature? I am seeking this information at the request of a physician friend who is suffering from carcinoma of the lung. Albert A Schultz M.D. Fort Dodge Iowa

ANSWER—Preparations from many organs (opotherapy, organotherapy) and tissues, including cancer tissue itself, have been tried in the treatment of human cancer, all so far without success. Gwyer in New York reported experiments with the calf's dried thymus in 1907 and 1908. In 1917 Kaminer and Morgenstern described experiments on the destruction of cancer cells by substances in the thymus and in 1929 Kittinger studied the effects of calf's thymus in advanced human cancer, with negative results. He used thymus emulsions in glycerin and water as well as in the serum of horses. Hanson obtained temporary improvement in inoperable cases by the intramuscular injection of an extract of the giant epithelial cells of the neck thymus of young calves. He called this extract "karkinolysin" and stated that "further proofs of its action and possible value" in the treatment of cancer would be "sought on a large scale" but it does not appear that any further reports have been published. Simpson and Marsh obtained no effects with karkinolysin in spontaneous mammary mouse cancer, and Meyer and Simmons had negative results in experiments with karkinolysin in implanted mouse cancer. Murray reported that under certain conditions transplants in rats of fresh thymus appeared to stop the growth of implants of a tumor of the breast. During the last five years it has not been possible to find any articles on the use of thymic preparations in any form of human cancer.

## SCHICK TEST FOR CHILDREN ENTERING SCHOOL

To the Editor—In the welfare stations inoculation with diphtheria toxoid is begun at the ninth month three injections of 0.5, 1 and 1 cc being given at intervals of three weeks. The school board a year ago passed a resolution requiring a certificate of immunization against diphtheria at the time of registration for school. I should like to know whether a negative Schick test obtained three to six months after the inoculation would be acceptable at the time of registration for school which would be in the fifth year or whether the Schick test should be done at the time of registration for school. Though I feel that the important period of protection is in infancy and in the preschool years I should like to settle the foregoing question in order that the authorities may set a definite time for the Schick test. Any advice on the subject will be greatly appreciated.

Charles P. De Fuccio M.D. Jersey City N. J.

ANSWER—Claus Jensen (*Deutsche med Wchnschr* 57: 324 [Feb 20] 1931) has shown that the rate at which antitoxin disappears from the blood is a function of a rectangular hyperbola  $Y = \frac{1}{\lambda}$  or  $T = \frac{A-X}{A\lambda} \cdot \frac{1}{\lambda}$

$A$  is the maximum concentration of antitoxin following an antigenic stimulus,  $\lambda$  is the amount of antitoxin which remains,  $T$  is units of time after the moment at which  $A$  is reached and  $K$  is a constant which is different for each individual. This is the same formula by which lysins and other antibodies disappear from the blood.

Because there seems to be a gradual loss in the diphtheria antitoxin content of the blood it appears that the best course to pursue would be to perform the Schick test just before the children enter school as well as from three to six months after the inoculations for the prevention of diphtheria have been completed. If the second Schick test is found to be positive, injection of one dose of alum precipitated toxoid would probably be recommended.

## CONTRACTING SYPHILIS FROM A NEEDLE PUNCTURE

To the Editor—While I was suturing the lacerated finger of a workman, the needle slipped and pierced my thumb going about a quarter of an inch deep. I squeezed my thumb and made it bleed freely, then applied alcohol and proceeded to finish the suturing. As a matter of precaution I had a Wassermann test done on the patient and the report was 4 plus. Another Wassermann test by a second laboratory was the same. The patient gave a history of a sore on the penis six years ago that went away. There is no history of secondary rash. As he never suspected the nature of the lesion on the penis he never had a Wassermann test before and of course no treatment. He has been married three years. His wife had a negative Wassermann reaction before giving blood for a transfusion five months ago and her Wassermann reaction is negative now. What are my chances of contracting syphilis from the needle puncture and what should I do about it?

M. D. Texas

ANSWER—There is no need of doing anything to the punctured thumb now. Syphilis is infectious during the first five years or less, and even though this patient had no treatment for syphilis, the likelihood of acquiring the disease from such a source and in such a manner is practically nil. When such injuries occur while working on patients with syphilis a thorough application of iodine into the wound or the application of 33 per cent ointment of mild mercurous chloride rubbed in vigorously for five minutes is usually sufficient. However, do not use iodine and the calomel on the same wound.

## TRICHOMONAS AND SPERMATOZOA

To the Editor—Recently I examined a vaginal smear to establish the viability of sperm. Microscopic studies showed innumerable trichomonads which appeared to be ingesting the sperms. In several instances there was a clear picture of a sperm struggling to avoid the engulfing process. In many other cases the end of the trichomonads opposite to that containing the cilium seemed to present a long tail—sometimes motionless and in other cases it appeared as though it had a waving motion suggesting the tails of sperms the bodies of which had been ingested. Will you inform me whether there is anything in the literature which discusses this occurrence or suggests its possibilities? If not could you suggest to me what conditions could make for the possible error in what I thought I had observed?

M. D. Little Falls Minn

ANSWER—It is possible that the observations in which the trichomonads were observed ingesting the spermatozoa are correct. It is well known that they ingest bacteria. Apparently, however, the literature does not contain reports of such observations.

Gynecologists recognize that women suffering from Trichomonas vaginitis have impaired fertility. The treatment for Trichomonas vaginitis can be found in any standard textbook of gynecology. Massage the prostate gland and search the prostatic fluid for the trichomonads, and, if any are present, clear up the infection by prostatic massage twice a week.

## GASTROENTEROSTOMY FOR EPILEPSY

To the Editor—For some time I have been hearing about an occasional cure of epilepsy as a result of a gastroenterostomy being done by an osteopathic surgeon. Have you any record of treatment of that kind being authentic?

M. F. Smith, M.D. Baton Rouge La.

ANSWER—Gastroenterostomy by any kind of surgeon is not a recognized or authentic form of treatment for epilepsy. Almost all epileptic patients have fatigue postures and suffer from chronic constipation. Any procedure which will correct either of these conditions will improve elimination and therefore will have an indirect beneficial effect on the epilepsy. Peterman has reported that occasionally the administration of an anesthetic, particularly chloroform, will stop convulsions for long periods. He has attributed the reported cures following circumcision to the effect of the anesthetic. Dr. John Howland reported such a case. If there is a large redundant loop of colon or a so-called Lane kink there might be some indication for surgery on the intestine. However, since Carman proved that there is no such thing as gastroenteroptosis, there could be no justification for gastroenterostomy as a treatment for epilepsy.

## SULFAPYRIDINE IN TREATMENT OF EPIDERMOPHYTOSIS

To the Editor—Is sulfapyridine in powder form of any value in the treatment of epidermophytosis?

L. Edward Giovine M.D. Woodside N. Y.

ANSWER—Observations to date do not indicate that sulfapyridine powder is of any value in the treatment of epidermophytosis, from either the clinical or the experimental point of view.

## CONTROL OF NARCOTIC ADDICTION

To the Editor—Will you kindly send me or tell me where I can get access to the latest and best methods of treating morphine addiction?

Milton E Robbins, M D, Laurelfon, L I

ANSWER—According to recent authoritative pharmacologic sources the therapy of morphine addiction is a highly specialized problem which, to be successful, requires combined medical, nursing and psychiatric management. Withdrawal treatment is undertaken as a rule only by those with special training in this field, and this medical phase of management of morphine addiction revolves round the use of several routine systems of treatment which are best adapted to meet the need of the individual case. The systems proposed for withdrawal treatment which are employed most frequently are those by G E Pettay (The Narcotic Drug Addictions, Etiologic Factors, Principles Involved in Treatment, Reasons for Possible Failures, *Memphis M Monthly* 29 337, 1909), Alexander Lambert (The Obliteration of the Craving for Narcotics, *THE JOURNAL*, Sept 25, 1909, p 985, Treatment or Drug Addiction, *ibid*, March 14, 1931, p 825) and C E Sceleth (A Rational Treatment of the Morphine Habit, *ibid*, March 18, 1916, p 860). These systems have in common the free use of intense purging and full doses of the belladonna alkaloids, although the evidence reported by Lambert casts some doubt on the value of atropine and scopolamine. Sedation appears to be the sheet anchor of therapy during withdrawal of the narcotic, chloral hydrate being one of the most satisfactory drugs for this purpose. Information concerning recent advances in the treatment of morphine addiction may be obtained by directing an inquiry to the U S Health Service hospitals at Leestown Pike, Lexington, Ky, or Fort Worth, Texas, where the federal government maintains special institutions for the special care of narcotic addicts. The important medical and social aspects of narcotic addiction may be reviewed by reference to the following:

## VITAMIN B IN TREATMENT OF EPILEPSY

To the Editor—Would you be good enough to let me know whether there is any evidence to support the use of any of the elements of the B complex, more specifically thiamine hydrochloride, in the treatment of epilepsy?

M D, New York

ANSWER—Fits develop in animals deprived of vitamin B<sub>6</sub>, but according to some unpublished work administration of this and other vitamins does not raise the threshold for convulsions. Some favorable results with thiamine hydrochloride have been reported by Schinder in human cases, but they are not striking. Vitamin B<sub>1</sub> has been used in large doses by Williams and Spies, but without conspicuous success.

## MEMBRANOUS CONJUNCTIVITIS

To the Editor—A girl aged 2 has a membranous conjunctivitis of six months' duration which has resisted local treatment, vitamins and foreign protein. The cornea is not involved, the general condition is good. Microscopic examination showed some polymorphonuclear leukocytes in the adherent exudate and some pneumococci. Please discuss the treatment of this condition.

M D, Montana

ANSWER—Cases of membranous conjunctivitis are exceedingly persistent and resistant to usual methods of treatment. Some cases due to the pneumococcus and streptococcus have responded to sulfanilamide and sulfapyridine in full oral dosage and a trial of one of these drugs seems indicated in this case, if they have not already been tried. If pneumococci are constantly found in the membrane, it would seem best to try sulfapyridine both locally and systemically. For local use the

3 per cent solution of sodium sulfapyridine five to six times a day with a 5 per cent ointment of sodium sulfapyridine at night would be advisable. Sulfathiazole might be as efficacious. The systemic dosage should be guided by the weight and general condition and after three to four days of full dosage (1 grain per pound of body weight daily) smaller doses should be continued for two to three weeks unless toxic symptoms are noted. It is usually best not to remove the membrane too frequently, as it reforms rapidly and will disappear when the infection is under control.

## PREMENSTRUAL MIGRAINE

To the Editor—Please outline treatment for a woman dentist aged 34, married, nulligravida, who since the age of 30 has been subject to attacks of left temporal migraine, particularly premenstrually. There is considerable premenstrual tension, moodiness and a desire to cry. The rest of the history is negative. Physical examination was negative except for a blood pressure of 90 systolic, 60 diastolic.

M D, Ohio

ANSWER—Recently a claim has been made for the efficacy of ammonium chloride in this type of condition. Ammonium chloride is taken orally for a few days before the menstrual period. Its modus operandi is presumably modification of the edema which is thought to be responsible for migraine during the premenstrual period. In some instances, claims have also been made for the effectiveness of endocrine preparations in these cases. Since aggravation of allergic symptoms is rather common in the premenstrual period, it is important not to overlook the possibility of allergy in such a case. The usual routine cutaneous tests or elimination diet may have to be tried in this instance.

## DIFFUSION OF SPINAL ANESTHETIC SOLUTION

To the Editor—Of what significance is the specific gravity of a spinal anesthetic with respect to the level of anesthesia desired? I was recently informed that such anesthetics, when introduced into the third or fourth intervertebral space in sufficiently high concentration, would produce cervical anesthesia. My informant also stated that the important factor concerned was the diffusion of a sufficient amount of anesthetic and that specific gravity had no role in obtaining desired levels of anesthesia (i.e., specific gravity of anesthetic, position of patient, and so on). May I have the benefit of your opinion?

M D, Pennsylvania

ANSWER—It must be assumed that, when reference is made to the space between the third and fourth vertebrae, the vertebrae in question are the lumbar vertebrae. It is possible to obtain anesthesia in the neck if the volume of solution injected into the lumbar interspace is large enough (that is, 8 to 10 cc). The concentration of the solution (procaine hydrochloride) should be 1.5 per cent. The alternate method, which is not so safe, is to depend on gravity and thus to inject a solution that is lighter in weight than the spinal fluid, to raise the patient's shoulders and to allow the anesthetic solution to move to the level of the thoracic curve. Another method (a gravity method) is to inject a solution heavier than spinal fluid and lower the patient's shoulders until the anesthetic solution reaches a sufficiently high point. The gravity method is not considered to be as safe as the method first mentioned.

POSSIBILITY OF INOCULATION WITH SYPHILIS  
BY A PRICK FROM A NEEDLE USED IN  
INJECTING A SYPHILITIC PATIENT

To the Editor—Two weeks ago I stuck my finger with a needle with which I had just given an injection for syphilis. Would it be possible for me to become infected without a chancre or sore?

M D, Virginia

ANSWER—It is not stated what kind of an injection had been given to this patient nor is it stated in what stage of syphilis the patient was. It would make a great deal of difference whether the patient had an old syphilis or whether it was a recent syphilis.

This is a common occurrence, and the chances are probably slim of one's contracting any disease, even if the patient has early syphilis.

It is true that if this was an intravenous injection and one stuck the finger with a needle immediately after the injection and if the patient had early syphilis there might be more cause for concern. There have been instances of this contingency reported in the literature and in some of them the physician never developed a sore or a chancre.

Our advice would be not to start treatment for syphilis for it one does this one must treat oneself the same as if one had actually contracted syphilis and should take the same therapy.

The recommendation would be to have a serologic test once a week for a period of twelve weeks after the needle prick. If the serologic test is consistently negative, one may forget it.

## CULTURAL EDUCATION OF A PHYSICIAN

WILLIAM W. ROOT LECTURE OF ALPHA OMEGA  
ALPHA HONOR MEDICAL SOCIETY

MORRIS FISHBEIN, M.D.

Editor The Journal of the American Medical Association  
CHICAGO

In an address delivered at the commencement of the Medical School of Harvard University at the Medical College in Boston March 9 1870 the Honorable Preston Peabody<sup>1</sup> spoke to the graduating class. He stressed particularly the importance of general culture.

To your professional knowledge you need to add general culture as wide and thorough as your special studies and labors will permit. You owe this to yourselves, to your brethren, to your calling. You owe it to yourselves for the man who confines himself to a single department however noble it may be, sacrifices his own intellectual manhood; moves not in a self-returning circle, but in a constantly diminishing spiral, and from year to year becomes less, and not beautifully less. You have a vital interest in poetry, literature and art—in all that is beautiful and grand in the works of God and man. You need them for recreation, solace, growth. You need them to bring you into due relation with the cultivated minds around you. You need them even for the highest professional success and reputation. No man can be great in his own profession who has not a vigorous intellectual life outside of it, beyond it, above it.

Since the time when medicine began to evolve from mysticism into science, educators have been concerned by the possibility that the trend toward pure science would lose for the physician that art which made him a humanitarian. The search continues still somewhat aimlessly for a test of character that will admit to medical schools or to medical practice only men of undoubted integrity, idealism and charitableness. As yet aptitude tests are in an "early experimental stage." Certainly there is as yet no method of determining the attributes of character or mentality that stamp the man who, on entrance into the study of medicine, will persist through the demands of the modern curriculum now speeded and intensified. Scientists hint vaguely of the scientific type of mind, but they recognize it by its results and not by any established standards useful for measurement before the results are achieved.

The educators have sought to aid the process of development of the ideal physician by attention to the

premedical curriculum hopefully attempting, by compulsory courses in English letters and composition in language in biology, even in sociology, philosophy, political economy, music, appreciation art and the drama, to implant the seeds of culture. The feeling persists that a cultural background is a necessity for the physician.

The report of the Commission on Graduate Medical Education<sup>2</sup> published in 1940 emphasizes the importance of appreciation of those beauties and delights that are to be found only in cultural subjects. The report says:

Medicine is one of the learned professions and this fact presupposes that each physician has acquired a broad cultural as well as scientific background and that because of this he is able to take his proper place in the community, both as a wise counselor to his patients and as an informed and active citizen. Too frequently the heavy schedule required in the college and medical school years which becomes even more exacting during the internship and residency, and the large proportion of the practitioner's time that he must devote to study and attendance at professional meetings in order to keep abreast of medical advances make it almost impossible for a physician to nourish his cultural interests. The man who neglects these interests lacks one important part of his preparation for life. The truly great physician somehow finds enough time, in spite of his busy practice, to develop various interests that add to his richness and depth. Medical educators should set aside time in the curriculum for cultural opportunities and should encourage students to take advantage of these opportunities even though they make no direct contribution to their knowledge of medicine. By this means, they will doubtless stimulate in many men a lasting interest in these broader fields, an interest that will carry over into their years of active practice.

Some medical educators have accepted as students in the medical school a few outstanding candidates who have majored in the humanities, hoping that these men will bring new viewpoints to bear on many of the problems of medicine. Other medical educators might follow this example. While it is realized that this need of broader cultural education for physicians is not strictly speaking a problem of graduate medical education nevertheless it is important to any complete concept of graduate and postgraduate training.

The report emphasizes, moreover, the need of culture for the intern who has passed from the stage of concentration on wholly medical subjects to a field in which he is partially engaged in medical practice. It says:

Equally important is the opportunity for the intern to continue his interest in the humanities and in cultural activities. The intern who has a real appreciation of music, philosophy or first editions should be able to find at least a few minutes each week to pursue these avocations.

<sup>1</sup> Read before the Alpha Omega Alpha Honor Medical Society, Atlantic City, N. J., June 11, 1942.

<sup>2</sup> Peabody, Andrew Preston. What the Physician Should Be. An Address Delivered at the Commencement of the Medical School of Harvard University, Medical College, Boston, March 9, 1870, published by request of the Faculty. Cambridge: Welch, Bigelow and Company. Printed for the University, 1870.

<sup>2</sup> Graduate Medical Education. Report of the Commission on Graduate Medical Education. University of Chicago Press, 1940.

These quotations indicate concepts of cultural education. The Oxford Dictionary refers to culture only as "the training and refinement of mind, tastes and manners, or the intellectual side of civilization." In his witty work on "Modern English Usage," Fowler<sup>3</sup> calls attention to what has happened to German *kultur* by referring the reader simply to the word "frightfulness." Many a distinguished colleague with whom I have spoken has indicated his concept of a cultural education as one which involves emphasis on Latin, Greek, English letters and similar subjects.

Thomas Henry Huxley,<sup>4</sup> in his essay on "Science and Culture," said

I hold very strongly by two convictions. The first is, that neither the discipline nor the subject matter of classical education is of such direct value to the student of physical science as to justify the expenditure of valuable time upon either, the second is, that for the purpose of attaining real culture, an exclusively scientific education is at least as effectual as an exclusively literary education.

But for those who mean to make science their serious occupation, or who intend to follow the profession of medicine, or who have to enter early upon the business of life, for all these, in my opinion classical education is a mistake, and it is for this reason that I am glad to see "mere literary education and instruction" shut out from the curriculum, seeing that its inclusion would probably lead to the introduction of the ordinary smattering of Latin and Greek.

Nevertheless, I am the last person to question the importance of genuine literary education, or to suppose that intellectual culture can be complete without it. An exclusively scientific training will bring about a mental twist as surely as an exclusively literary training.

French and German, and especially the latter language, are absolutely indispensable to those who desire full knowledge in any department of science. But even supposing that the knowledge of these languages acquired is not more than sufficient for purely scientific purposes, every Englishman has, in his native tongue, an almost perfect instrument of literary expression, and, in his own literature, models of every kind of literary excellence. If an Englishman cannot get literary culture out of his Bible, his Shakespeare, his Milton, neither in my belief, will the profoundest study of Homer and Sophocles, Virgil and Horace, give it to him.

At the same period the subject of cultural education was disturbing many a leader in the field of medicine. Sir Thomas Clifford Allbutt,<sup>5</sup> who gave the introductory address at St. George's Hospital in 1889, took as his subject "The Need for a Liberal Education." He spoke of a university as "a permanent embodiment of the ideal of wisdom as opposed to technical furniture—of the ideal of mental culture as opposed to the collection of tips and devices in memory." Then, in an address given in 1892, he said

It is sad to hear it commonly said that the day of the learned physician is past, that they are gone with periwigs and bric-a-brac. And I have had already to observe to my pain that the Cambridge medical student of today is by no means "learned", that too he often thinks loosely, and that he does not always write even the English of the gentlemen who do the *Fires* and the *Murders* for the country journals.

Largely as a result of this lecture the question of introducing an essay into the tripos examination in order to improve the facility of writing English was discussed at length throughout England.

An important defender of literary education as opposed to pragmatic studies for cultural purposes is Bertrand Russell.<sup>6</sup> Writing of "The Place of Science in a Liberal Education," he said

From the point of view of training the mind, of giving that well informed, impersonal outlook which constitutes culture in the good sense of this much misused word, it seems to be generally held indisputable that a literary education is superior to one based on science. Even the warmest advocates of science are apt to rest their claims on the contention that culture ought to be sacrificed to utility. Those men of science who respect culture, when they associate with men learned in the classics, are apt to admit, not merely politely, but sincerely, a certain inferiority on their side, compensated doubtless by the services which science renders to humanity, but none the less real.

After the Civil War medical education reached an exceedingly low level in this country. President Eliot of Harvard, quoted by Florence Sabin<sup>7</sup> in her life of Franklin P. Mall, pointed out that "There were no requirements for admission to our medical schools. To secure admission a young man had nothing to do but to register his name and pay a fee. In consequence hundreds of young men joined the medical schools who could barely read and write." President Eliot described them as young medical practitioners who were "uncultivated men with scanty knowledge of medicine and surgery, who had had opportunity for but a small amount of observation by the bedside and but little experience in hospitals."

In 1905 the creation of the Council on Medical Education of the American Medical Association and the searching investigation of medical education by Abraham Flexner led to renewed emphasis on basic education as part of the preparation of the student for medical studies. The leadership of Dr. Franklin P. Mall, eminent anatomist, and of William Henry Welch of the Johns Hopkins group, who have recently reflected those years in their autobiographies, came to be widely recognized throughout American educational circles. But the essays of Sir William Osler were probably more significant than many other contributions in directing the trend of basic education into sound cultural lines. In his essay "The Master Word" Osler<sup>8</sup> wrote

Professional work of any sort tends to narrow the mind, to limit the point of view and to put a hall-mark on a man of a most unmistakable kind. On the one hand are the intense, ardent natures, absorbed in their studies and quickly losing interest in everything but their profession, while other faculties and interests "rust" unused. On the other hand are the bovine brethren, who think of nothing but the treadmill and the corn. From very different causes, the one from concentration, the other from apathy, both are apt to neglect those outside studies that widen the sympathies and help a man to get the best there is out of life. Like art, medicine is an exacting mistress, and in the pursuit of one of the scientific branches, sometimes, too, in practice, not a portion of a man's spirit may be left free from other distractions, but this does not often happen. On account of the intimate, personal nature of his work, the medical man, perhaps more than any other man, needs that higher education of which Plato speaks—"that education in virtue from youth upwards which enables a man eagerly to pursue the ideal perfection."

# THE CULTURAL EDUCATION OF MEDICAL LEADERS OF THIS GENERATION

Since the views of leaders in American medicine on the subject of cultural education obviously must have been conditioned largely by the type of cultural education which they themselves had I have referred to some of the biographies and autobiographies which have recently become available as a form of literary research which might yield data leading toward a scientific conclusion. The study has been one of enjoyment, stimulation and inspiration. Many of these great leaders I have known personally, with others I have corresponded at various times. The record of their lives is varied and fascinating.

In "The Life of Sir William Osler" by Harvey Cushing<sup>9</sup> appears this brief note about a teacher of Sir William Osler to whom Osler himself credited much of the cultural education that he had. The head prefect of the school called Weston, some fifty years after the period in which he had been a favorite teacher of Sir William Osler wrote

As a boy I had the common experience of fifty years ago—teachers whose sole object was to spoonfeed classes, not with the classics but with syntax and prosody, forcing our empty wits, as Milton says to compose "Theames Verses and Orations" wrung from poor striplings like blood from the nose, with the result that we loathed Xenophon and his ten thousand, Homer was an abomination while Livy and Cicero were names and tasks. Ten years with really able Trinity College, Dublin, and Oxford teachers left me with no more real knowledge of Greek and Latin than of Chinese and without the free use of the language as keys to great literatures.

## WILLIAM HENRY WELCH

William Henry Welch influenced profoundly the cultural education of many an American physician. From the distinguished biography by Simon and James Thomas Flexner<sup>10</sup> we learn

In his later years Welch ascribed the sudden flowering of his interest in medicine not so much to the studies he pursued as to the personality of his teachers. "One can decry the system in those days," he said, "but the results were better than the system. The College of Physicians and Surgeons stood then, as it has always stood, in the front rank of American medical schools. Our teachers were men of fine character, devoted to the duties of their chairs; they inspired us with enthusiasm, interest in our studies and hard work, and they imparted to us sound traditions of our profession; nor did they send us forth so utterly ignorant and unfitted for professional work as those born of the present, greatly improved methods of training and opportunities for practical study are sometimes wont to suppose."

## J. M. T. FINNEY

The recent death of Dr. J. M. T. Finney took from American medicine one of its most cultured leaders, a man of broad vision, recognized skill and wide associations. Of his early training he<sup>11</sup> said

It is interesting to look back now and try to evaluate the most potent influences and their effect upon my character. What stands out in my mind after all these years is not so much what I learned from my studies but what I gained from more or less intimate personal contact with real human men who were sufficiently well educated themselves to appreciate true values in education and to stimulate in the minds

of their students the desire to attain those values. We are all in a measure "copy cats." How often do we see reflected, unconsciously perhaps, in students certain idiosyncrasies of their teachers—it may be methods of thought, modes of expression, mannerisms, poses or what not.

## WILLIAM SYDNEY THAYER

The views of William Sydney Thayer, a former president of the American Medical Association, a student of the classics and himself a poet of no mean ability, should be significant. Thayer was a natural linguist and scholar. Besides the ancient languages he read and spoke and could think in French, German, Italian and Russian. Of his cultural education, he<sup>12</sup> said

I am one of those who believe earnestly that a broad general training, not only in the natural sciences, but in ancient as well as in modern languages and mathematics, is important for him who would study medicine if he is to be a broad-minded and scholarly man.

## CHEVALIER JACKSON

Known as a scholar, a distinguished inventor, an artist of recognized ability and as a recipient of the Distinguished Service Medal of the American Medical Association, Chevalier Jackson's record of his own cultural education is especially interesting. In his autobiography he says<sup>13</sup>

Next to drawing my greatest interest in school work was in physiology, geography, Latin, Greek, English and mathematics, about in the order given. History, telling about what the kings, dictators, rulers and politicians did, was uninteresting.

## VICTOR C. VAUGHAN

Turning to the West, I submit a few selections from the autobiography of Victor C. Vaughan<sup>14</sup>

While nominally I had my schooling at Hazel Hill, I received the better part of my education at home. My wise mother did not pretend to dictate my instruction. She simply placed the books she desired me to read within my reach and supplied no others. Scott, Dickens, Thackeray.

Poor training! a present day educator would say for one whose adult life was to be devoted to science. This may be true but I am reciting facts. I cannot deny that my scientific work might have been more productive had my early training been different.

In 1917 Dean West of Princeton University held a day for glorification of the classics. He wished to see these studies restored to their former position in the curricula of our colleges and universities, and I was in sympathy with him in this particular.

Although my adult life has been given to the sciences, I wish to testify that the first author to stimulate the pyramidal cells of my cerebral cortex was old Virgil, and even now in my old age when I seek mental recreation there is only one book which I prefer to Virgil and that is Dryden's translation, which I read with less effort.

## BERKELEY MOYNIHAN

Americans who for many years admired the skilful oratory of Sir Berkeley Moynihan should enjoy particularly these sections from the recent biography by Donald Bateman,<sup>15</sup> which are more than explanatory of the Moynihan technic in public address.

Of extramural reading he did little. He had no time for it. His love of literature developed later. Yet though his taste

was still unformed, its scaffoldings were visible. In Shakespeare's sonnets he unearthed a sympathetic mirror of his thoughts, in them he found a satisfaction that communion with his friends did not promote. To memorize them was easy, to repeat them delicious. He saw the spring in them, and not as yet the autumn they concealed—that was for the future.

He had, even in those early days, an ardent love of words. Dulcet phrase and mellifluous adjectives entranced him. They matched the sweet depths of his voice. No less for their music than their meaning did he cherish them. Except within the confines of his home he had no chance for recitation, his family were the only audience he could then command. But, from his first encounter with the sonnets, his devotion was sealed, he became the acolyte before the shrine of words.

The only other seas of his literary voyaging were the varied oceans of the Bible. It was lovely English of the Bible that excited him, he did not then explore its philosophic content. But those words, velvet and resonant—how he loved them. In them he had the artist's apprehension of beauty—painful, intangible, etheral.

For music, strangely, he had but little ear.

In pictorial art he had no interest, nor such have medical students as a rule.

When he could afford it he went to the theatre.

#### ARTHUR E. HERTZLER

Consider a brief statement by the eminently pragmatic Arthur E. Hertzler,<sup>16</sup> author of the widely read "Horse and Buggy Doctor."

The course of study in those days consisted chiefly of Latin, Greek, mathematics and English.

All I remember about Greek is that you learn one verb, all the rest are irregular, that Darius had three huge sons and that buzzard meat tastes like venison only sweeter. Nevertheless were I to begin the study of medicine again I should choose the same courses in Latin and Greek as a preliminary. For though, like Shakespeare, I had small Latin and less Greek, they made terminology more interesting and intelligible.

Four years in the academy equaled what is about the first two years of the colleges of today. Better training in literature than most college graduates (three years of English composition and rhetoric—our English teacher was a Canadian who had the idea that English was a good language to learn), mathematics as far as differential calculus, German, most grammar and time spent in the utterly futile attempt to read Wallenstein and several other works of the same kind—everything except what I would need in the future. I never could understand poetry or drama even in English and the German was a nightmare.

#### LEWELLYS F. BARKER

While Lewellys Barker<sup>17</sup> tells us in his recently published "Time and the Physician," an autobiographic work, little of his own cultural education, he gives us some thoughts on the subject in his book on "The Young Man and Medicine"<sup>18</sup> which are definitely apropos to our purpose.

Another fundamental human need is connected with the activity of the aesthetic judgment. Man has a desire for the beautiful. He loves to create beautiful things himself, and he derives satisfaction, also, through the enjoyment of beauty in nature and in man, beauty in his own works, or beauty in the works of others.

The young man in medicine in his student days can scarcely fail to do better work, if in that work he strive not merely to acquire knowledge but also to satisfy his aesthetic sense. As a teacher in the medical school I soon learned to look with favour upon the student who in the anatomical laboratory

made a "beautiful" dissection, or who, in the pathological institute, stained his sections of tissue so perfectly that they delighted me, or who, in the clinic, made physical examinations so skilfully and kept records with such order and accuracy that they charmed the observer. There are exceptions, of course, but, in general, it will be found to be true that the pupil who works in the spirit of the true artist, who knows how to delight in the work that he does for its own sake, who, besides being interested in content, loves perfection of form, is likely to go far. But even though he go not far, he has experienced on his way satisfactions of his need of beauty that are not to be despised.

And the same considerations apply to the work of the medical man after graduation from the medical school. The art of medical practice, the art of medical teaching, the art of medical discovery, and the art of medical writing are likely to be best promoted and to be most greatly enjoyed by those who pursue them in compliance with the urge of their aesthetic motives.

#### HANS ZINSSER

Among the most cultured of American investigators scientists and physicians was Hans Zinsser. In his intimate and revealing biography "As I Remember Him" Zinsser<sup>19</sup> gave much of the credit for his cultural education to some of his teachers in the letters and in science who had had a tremendous effect on his personality. Among the most revealing are the following paragraphs.

George Edward Woodberry was at that time best known for his poetry. I say "at that time" because, as I judge him now, I believe that his ultimate place—a high one in American letters—will rest on his prose writings, his critical essays, and his *Taormina*, all of which combine distinction and color of style with great learning and a sensitiveness to beauty which mark him as a poet writing prose. Woodberry was of the tradition of Shelley, Wordsworth and Coleridge. His mind was deeply saturated with European culture and the art of Greece and of Italy.

Whatever may be the eventual position of Woodberry in American letters—an estimate which I am not competent to make—he was unquestionably one of the greatest teachers this country has seen, inspiring with his own passionate sincerity and sensitive perceptions a large and diverse group of young men, few of whom, whatever their subsequent occupations, ever lost entirely the imprint of his personality.

The destinies of man are guided by the most extraordinary accidents. In my sophomore year, while in the Woodberryan poetic exaltation, and feeling much of the time like a young Shelley, I threw a snowball across the campus at a professor emerging from the Natural Science Building. It was a prodigious shot, a good hundred yards, I think. I hit him in the ear, knocked his hat off, and had time to disappear around the corner. I had nothing against him. It was an impulse, and a happy one, because I became guiltily conscious of him, thereafter, and eventually I took one of his courses as a sort of apologetic gesture. He happened to be both an anthropologist of note and a philosopher, and it was he who awakened in me the realization of the philosophical implications of scientific fact. There were great teachers of science at Columbia in those days, and the junior year—largely owing to the inspiration of the man whom I had hit in the ear—found me, without cutting loose entirely from the Department of Comparative Literature, feeling as though I had suddenly entered a new world of wonders and revelations on the top floor of Schermerhorn Hall under the reign of Edmund P. Wilson and Bashford Dean.

My college education, to make a long story short then consisted of Woodberry, Wilson and Dean—thus again affirming the truism that one is trained by men and not by curriculum. The remark about the superb educational value of sitting on

a log with Mark Hopkins on the other end of it is quite correct in principle—though from what I have read of that gentleman's philosophical views and information, I should have picked some one else for my log

#### DIRECTED READING

Hardly one of the counselors who would guide us to culture but recognizes the importance of properly directed reading for the continuous improvement of culture. Thus Sir William Osler<sup>20</sup> in his "Aequanimitas and Other Addresses," published in Philadelphia in 1904, wrote

For the general practitioner a well used library is one of the few correctives of the premature senility which is so apt to overtake him. Self centered self taught he leads a solitary life and unless his every day experience is controlled by careful reading or by the addition of a medical society it soon ceases to be of the slightest value and becomes a mere recreation of isolated facts without correlation. It is astonishing with how little reading a doctor can practice medicine, but it is not astonishing how badly he may do it.

Osler had, of course his favorites among the writers of all time. For medical students he suggested a bedside library saying

A liberal education may be had at a very slight cost of time and money. Well filled though the day be with appointed tasks to make the best possible use of your one or of your ten talents rest not satisfied with his professional training but try to get the education if not of a scholar at least of a gentleman. Before going to sleep read for half an hour and in the morning have a book open on your dressing table. You will be surprised to find how much can be accomplished in the course of a year. I have put down a list of ten books which you may make close friends. There are many others, studied carefully in your student days will help in the inner education of which I speak.

- I Old and New Testament
- II Shakespeare
- III Montaigne
- IV Plutarch's Lives
- V Marcus Aurelius
- VI Epictetus
- VII Religio Medici
- VIII Don Quixote
- IX Emerson
- X Oliver Wendell Holmes (Breakfast Table Series)

Sir Thomas Browne's "Religio Medici" and Rabelais were his special favorites. In the library at McGill, a memorial to Osler, one may see his great collection of various editions of these two literary masterpieces.

Again in "The Alabama Student and Other Biographical Essays" published in 1908, he<sup>21</sup> emphasized his devotion to these writings.

For the student of medicine the writings of Sir Thomas Browne have a very positive value. The charm of high thoughts clad in beautiful language may win some readers to a love of good literature but beyond this is a still greater advantage. Like the "Thoughts of Marcus Aurelius" and the "Enchiridion of Epictetus" the *Religio* is full of counsels of perfection which appeal to the mind of youth still plastic and unhardened by contact with the world. Carefully studied from such books come subtle influences which give stability to character and help to give a man a sane outlook on the complex problems of life. Sealed early of this tribe of authors, a student takes with him as *compagnons de voyage* lifelong

friends whose thoughts become his thoughts and whose ways become his ways. Masters of self conscientious devotion to duty, deep human interest in human beings—these best of all lessons you must learn now or never and these are some of the lessons which may be gleaned from the life and from the writings of Sir Thomas Browne.

Innumerable suggestions have been made as to the type of reading that the physician should use for the improvement of his cultural education. An earnest student once asked the great Sydenham for advice as to what he should read to lay a sound foundation in medicine. To this request Sydenham replied "Don Quixote."

As a protest against a wholly technical education, Raymond Pearl in his selected list of reading for cultural education of the scientist also emphasized the lack of reading as one of the reasons for our failure to produce culture in our medical students. Raymond Pearl<sup>22</sup> said

In consequence of the widely prevailing pedagogical theory that needlework, jig-sawing, salesmanship and many other kindred academic disciplines are of at least equal cultural and intellectual value in the training of our youth to the study of Greek or Latin or mathematics or chemistry, coupled with the permission if not active encouragement to the undergraduate to specialize during the state of his mental infancy it results that when the young things begin serious graduate work a solidly grounded general background upon which to build a sound specialism is precisely what, generally speaking they most completely lack.

President Robert M. Hutchins of the University of Chicago and Mortimer Adler and many others have prepared lists of the books that should form the basis of culture. President Eliot of Harvard had his five foot shelf. The American Library Association developed a list and presented a set especially bound to the President in the White House. The average physician will be amazed on personal consultation to discover how slender an intimacy he has with most of the volumes that are included in these selections. From this point of view alone, the cultural education of the modern physician is lacking.

#### THE BASIS OF A CULTURAL EDUCATION

I have indicated by these few citations the belief of practically every distinguished leader who has approached the subject that directed reading is a vital part of a cultural education. The list prepared by Sir William Osler includes books to which we turn again and again and which provide new values with reading and rereading. The writings of Mark Twain, particularly "Huckleberry Finn" the diaries of Samuel Pepys, Walpole and Evelyn, the Elizabethan dramatists and poets specially Dryden, the startling wisdom of Samuel Johnson, the essays of Emerson have been emphasized so frequently by so many guides to that which is best in cultural reading that reemphasis is hardly necessary. And I would recommend personally for stimulation and inspiration the famous biographies and autobiographies that I have already mentioned. Add to them Vallery-Radot's "Life of Pasteur," Sir Rickman Godlee's "Life of Lister," the biography of Metchnikoff by his wife Olga, the essays of Stephen Paget, of Harvey Cushing and of John Chalmers DaCosta. You will find in these more that is thought provoking and beautiful than ever you have dreamed of.

## PERSONAL ASSOCIATION

First in importance in cultural education, and as a factor that makes for success in medicine and in life, is early and intimate association with preceptors and teachers who have the ability to inspire. Men of the type of William Henry Welch, Halstead, Ludvig Hektoen, Victor C. Vaughan, Frank Billings, Hans Zinsser and Sir William Osler have had this quality.

Many years ago I studied the records of the graduating classes of three of our greatest universities at a period twenty years after graduation. The number of men who had attained medical fame, either international, national, state or local, could be definitely related to the inspiring teachers with whom they worked and to the kind of contact that they had had with such teachers. Those who associate with preceptors who have achieved fame and leadership secure direction and guidance not only to the scientific techniques and methods that they have developed but also, provided the contact is sufficiently intimate, to music, the drama, sport, art, recreation and even training in the art of writing. This is what Zinsser meant by his reference to Woodberry. This too is what made Thayer say ultimately "I have a passion to use the perfect word, the inevitably right sentence." This, it has been noted, is what stamped every pupil of Harvey Cushing with many a mannerism and habit of thought and speech that on occasion out-Cushings the great Cushing himself. These men were not necessarily first in their studies and examinations. Occasionally as with Thayer and Paul Ehrlich they triumphed over recognized failure.

Looking back on his own education, Sir James Mackenzie deprecated the type of education that places emphasis on memory rather than on the power of reasoning. He condemned the trend in our medical education which leads toward the type of teacher who merely repeats what his own teachers taught him and whose pupils merely repeat what he teaches them. Mackenzie<sup>23</sup> said:

There are two very distinct qualities of the human mind, memory, and the power of reasoning. The earliest to be developed is that of memorizing, and this can be cultivated with great ease. The power of reasoning is quite different, although, no doubt, memory takes a part. When we look at a great number of students, we discover that this power of memory is greatly developed in a few, and that all our educational methods are devoted to its cultivation. Examinations are specially contrived for the purpose of discriminating those with the best memories, and to them all the honours and prizes are given.

The individuals who, on the contrary, possess more of the power of reasoning than their fellows receive no consideration. There are minds which have a difficulty in remembering isolated facts, but if these facts are related in some consecutive manner, they can not only remember them, but also appreciate their bearing on one another. But this type of mind is slow in acquiring knowledge and in our present day methods of education less and less encouragement is given to this type of student.

## GAMES, SPORTS AND CULTURE

In Finney's recent autobiography he says all that can be said of games and sports in just a few lines:

One important lesson that one learns from athletics, especially football, is how to take hard knocks, and when occasion requires, how to give them too. Self restraint along all lines

so hard to acquire is a "sine qua non" in order to be successful in any form of athletic sport. The qualities necessary to insure success in athletics are quite as necessary in positions of responsibility in after life: courage, brains, agility of mind and body, ability to think on one's feet, thoroughness, application, diligence, honesty, determination—all of which are summed up in that good old English word "guts."

There are students and physicians who find over the bridge table and on the golf course assets for building character. Invaluable to me have been many of the lessons learned and the associations acquired by these pleasant pathways. They are inordinate consumers of time, but, having tried, as Arnold Bennett suggested, to live always on twenty-four hours a day, it has seemed to me that those whose production is greatest are usually least pressed for time to be spent in cultural pursuits.

## WRITING AS A CULTURAL MECHANISM

Previously I have referred to the production of an essay as a part of cultural education, and of Sir Thomas Clifford Allbutt's comment. In his own book, entitled "Notes on the Composition of Scientific Papers," he<sup>24</sup> said that it was his custom to make at least four drafts of a manuscript before it could be considered ready for the printer. His first draft was compiled from notes. Then redundant words, phrases, sentences and paragraphs were deleted. Sentences out of position were removed to better positions, coherence and logical development of thought were tested. In the next revision new thoughts, sentences and paragraphs were inserted and all doubtful meanings were eliminated. In this revision also simplicity was sought and ornamental passages were removed. Finally, after a few weeks, Sir Clifford would read the entire manuscript and make a final revision.

Those who have envied Sir William Osler his beautiful command of English should see the collection of his manuscripts in the Osler room of McGill University. One stage followed closely on another in the preparation of his papers. First were notes of various kinds, written here and there and collected at opportune moments. The first draft was an outline written in long hand. Next came the first typewritten copy with interlineations, transpositions and deletions. Then came a second typewritten copy with evidence of many additional modifications, and finally a third typewritten copy which could be sent to the printer. Even this last copy provided for final corrections.

Quite recently Sir Robert Hutchinson<sup>25</sup> found cause to castigate medical writers for the extraordinary dullness of their productions.

In considering the quality of medical literature distinct from its quantity one has to distinguish between its content and its form. As regards the content, one is struck by the great excess of facts and the comparative absence of ideas, generalizations and hypotheses, there is, in short, too much observation and recording and too little reflection. Hence much of it is like a heap of bricks without any mortar to hold them together. The power of wide generalization, of course, is very rare, but medical writers might at least show greater imagination, and the lack of this has the sad consequence that much medical literature is deplorably dull. This dullness is the more curious considering that the subject matter is so interesting. It may be contended in reply to all

<sup>24</sup> Allbutt, Thomas Clifford. *Notes on the Composition of Scientific Papers*, ed. 3. London: Macmillan Company, 1923.  
<sup>25</sup> Hutchinson, Sir Robert. *Annotations*. Dulles, Va.: Literature Bull. Minnesota M. Foundation 26 (Feb.) 1941.

<sup>23</sup> Wilson R. Macnair. *The Beloved Physician*. Sir James Mackenzie, New York, Macmillan Company, 1926.

this that the style of medical writing is not of much importance because these are read primarily for their matter. Unquestionably this is too superficial a view for, as Allbutt said, "The man of science ought best to know that style and matter can no more be dissociated than skin and bone, but if we write clumsily, loosely or disjointedly our thoughts are accordingly."

#### SIGNIFICANCE OF A CULTURAL EDUCATION

I have been more and more impressed of recent years with that trend in medical education which holds the young man strictly in the field of technical study until he has reached the middle years or the ultimate of what Herbert Spencer called the prolongation of infancy. This concentration on technical education which carries young physicians through internship, a residency or assistantship, extra training in anatomy, physiology, pathology and other basic medical sciences and at least two years of additional study and practice before they can be certified has tended to withdraw the interests of young physicians from most of those aspects of life and work which might be included in cultural education.

The physician of an earlier day assumed a position of leadership as a citizen in his community, as a member of medical organizations concerned with public health, the economics of medical practice, general education and similar problems. Today there is a notable lack of young men in the midst of such activities, so that the charge is being made again and again that leadership in American medicine is chiefly by the elders. The elders, because of their social and economic positions, it is charged, are too conservative to lead in a world confronted by tremendous social changes. Recently a talented novelist made one of her characters say that it is about as much use to give advice to an old man as to give a tonic to a corpse. Emphasis on certain types of cultural education prerequisite or associated with education in medicine might serve as a wholesome corrective of this tendency.

#### CONCLUSION

The prescription for a perfect formula for a cultural education, even if based on an analysis of the considerations that have been here set forth, is difficult to concoct. Obviously the product may be offered in the future, after thorough trial in the laboratory and in the clinic. However, I can suggest some of the ingredients and leave to the physician the determination of the proportions in which they are to be used in the individual case. The menstruum of this prescription will be a literary background, composed of directed and required reading in an emulsion with enjoyable fiction, tales of mystery and poems. The active ingredient must be the classics, associated in a synthesis or perhaps a symbiosis with history, ethnology and anthropology. Golf, bridge and certainly football in excessive doses can be toxic to culture, whereas in homeopathic quantities they may be exceedingly beneficial. For color and flavor add measured quantities of art, music, drama and travel. The preceptor who prescribes will give to the ailing student that intimate personal relationship which breeds confidence, faith and understanding. And on the label write "Take frequently throughout life and at the approach of death!" for this mixture will permit those who have developed an addiction to face the ultimate dissolution with equanimity.

## THE TEACHING OF ANESTHESIOLOGY IN THE ARMY

STEVENS J. MARTIN, PH.D., M.D.

Major, M. C. U. S. Army, Chief of Sections of Anesthesia and Operating Pavilion, Resuscitation and Oxygen Therapy,  
Tilton General Hospital

FORT DIV., NEW JERSEY

It is now a well established fact that inadequate anesthesia was responsible for much of the surgical morbidity and mortality of the last war. Such costly lessons must not and will not be repeated in the present conflict. Anesthesiology has progressed tremendously in the last two decades and has been recognized as an indispensable department in the organization of leading university<sup>1</sup> and other civilian<sup>2</sup> hospitals. Its recognition in army hospitals<sup>3</sup> has begun with the designation of a special section for anesthesiology. The organized didactic and clinical instruction by the Army of its personnel in the science of anesthesiology constitutes a further advance. The plan of instruction at Tilton General Hospital is now presented to the medical profession for the first time.

Aside from the mobilization of combat units for the successful prosecution of this war, the various services of the Army have been augmented tremendously by specially trained personnel. This task has been greatly facilitated by the work of the Medical Science division of the National Research Council<sup>4</sup> and its committees, representing the scientific resources of our nation. The Subcommittee on Anesthesiology, consisting of leading anesthesiologists (Drs. Ralph M. Waters, chairman, E. A. Rovenstine, secretary, John S. Lundy, Ralph M. Tovell and Lewis S. Booth) was requested, among other things, to propose a teaching program in this specialty for army, navy and public health officers. It was suggested that "refresher courses" for medical officers of these forces might be conducted with the aid of a prepared manual<sup>5</sup> at selected locations throughout the country. The Research Council Advisory Committee has already designated six civilian centers for special courses in anesthesiology. These will begin functioning on or about July 1. In this way the need for trained anesthesiologists for our expanding forces might be alleviated. The demand now for such personnel in the Army is admittedly acute. It appeared that, until the program of the subcommittee in anesthesiology got under way, the problem of providing anesthetists at this and nearby posts might be partially met by offering instructions in anesthesia. Accordingly, a course in the fundamental principles of anesthesiology was begun last July at Tilton General Hospital<sup>6</sup>.

During the past year, four courses of three different types were given in anesthesiology.

Type A. Officers of station or general hospitals. The first two courses were presented to medical officers of

this post, the Station Hospital and the 210th General Hospital, Fort Dix, N J, and the Station Hospital, Fort Monmouth, N J

Type B Officers of evacuation hospitals The third course was given to officers of the 7th Evacuation Hospital

Type C Enlisted men of the Medical Corps on mobile auxiliary, surgical teams The last course was prepared for enlisted men and a nurse of Tilton General Hospital, who were placed on casualty or auxiliary surgical teams

TABLE 1—Schedule of Lectures for Officers of General and Station Hospitals

| Date        | Subject Matter  |
|-------------|---|
| 1st Week    |   |
| July 21 Mon | —Introduction purpose, history, scope of anesthesia, records            |
| 22 Tues     | —Cardiovascular system—pertinent normal physiology                      |
| 23 Wed      | —Cardiovascular system—pathologic physiology—shock                      |
| 24 Thurs    | —Central nervous system—relation to anesthesia                          |
| 25 Fri      | —Autonomic nervous system—relation to anesthesia                        |
| 2d Week     |   |
| July 28 Mon | —Respiratory system—physical principles involved, gaseous exchange      |
| 29 Tues     | —Respiratory system—chemical and nervous control                        |
| 30 Wed      | —Respiratory system—pathologic physiology, asphyxia                     |
| 31 Thurs    | —Miscellaneous topics—acidosis, heat stroke versus exhaustion           |
| Aug 1 Fri   | —Traction reflexes, liver and kidney malfunction                        |
| 3d Week     |   |
| Aug 4 Mon   | —Chemistry and pharmacology—volatile agents ether, vinylene, chloroform |
| 5 Tues      | —Chemistry and pharmacology—gases nitrous oxide, ethylene, cyclopropane |
| 6 Wed       | —Chemistry and pharmacology—local anesthetic agents                     |
| 7 Thurs     | —Chemistry and pharmacology—barbiturates                                |
| 8 Fri       | —Chemistry and pharmacology—opium derivatives                           |
| 4th Week    |   |
| Aug 11 Mon  | —Chemistry and pharmacology—alcohols, paraldehyde, inorganic salts      |
| 12 Tues     | —Chemistry and pharmacology—non-narcotic drugs and gases                |
| 13 Wed      | —Premedication—purposes, principles and technique                       |
| 14 Thurs    | —Regional anesthesia—principles, techniques for upper body              |
| 15 Fri      | —Thoracic, abdominal and inguinal regions                               |
| 5th Week    |   |
| Aug 18 Mon  | —Regional anesthesia—perineal and sacral regions and lower body         |
| 19 Tues     | —Regional anesthesia—diagnostic and therapeutic blocks                  |
| 20 Wed      | —Spinal anesthesia—subdural and epidural                                |
| 21 Thurs    | —Rectal, subcutaneous and intravenous anesthesia                        |
| 22 Fri      | —Stages and signs of anesthesia   |
| 6th Week    |   |
| Aug 25 Mon  | —Inhalation anesthesia the theories and methods employed                |
| 26 Tues     | —Resuscitation and oxygen therapy } Demonstration of                    |
| 27 Wed      | —Resuscitation and oxygen therapy } iron lung                           |
| 28 Thurs    | —Problems in the care and transport of patients                         |
| 29 Fri      | —Common anesthetic considerations and emergencies                       |

gical teams In all courses, the following five basic subjects were discussed

- 1 Introduction purpose, definitions, records, and so on
- 2 Pertinent basic sciences
- 3 Anesthetic techniques and stages
- 4 Complications recognition and treatment, asphyxia, shock, airways, artificial respiration, inhalation and fluid therapy
- 5 Operating room hazards fires, explosions, transport of patients

The general plan of instruction consisted of a series of (a) lectures of one to two hours' duration, (b) demonstration of various techniques with the aid of films

or slides and (c) practical instruction in various anesthetic procedures The extent of instruction was necessarily limited by the status of the student and particularly by the function of the unit to which he was assigned

Thus, in table 1 may be seen the outline of a six weeks lecture course given to medical officers of general or station hospitals Since specialists in surgery are assigned to such posts, the services of a competent anesthesiologist are indispensable The outline was designed to cover the field rather broadly Mimeographed lecture outlines were passed out before each session to serve both as a stimulus for class discussion and also as a guide for future reference and reading outside While the schedule appears to have covered the subject intensively, only the significant and practical aspects of anesthesiology were emphasized The subsequent practical work extended for two to ten months Students were assigned to operative schedules and made the customary preoperative and postoperative rounds on their patients Pertinent data taken during such rounds or during the interval of anesthesia were recorded on special charts as well as on Form 55-0-1 Such charts were filed after they were used for group discussions of errors, complications and sequelae

Table 2 shows the lecture outline employed in the instruction of assigned officers of the 7th Evacuation Hospital Only twelve conferences with demonstrations were held and practical instruction continued for only three weeks As these officers were members of a mobile surgical unit in which surgery and anesthetic equipment would be of a different character than that found at a station or general hospital, particular emphasis was given to inhalation (open system), intravenous and some regional anesthesia and the technique of endotracheal intubation

Table 3 shows the lecture outline prescribed for the instruction of seven enlisted men of the Medical Detachment and one nurse assigned to casualty units In addition to the twelve sessions and demonstrations, personal supervision of the administration of anesthetic agents continued for twelve weeks Open drop anesthesia was the only technique taught, with emphasis being given to the methods of introducing artificial airways and of detecting and treating respiratory and circulatory complications

#### COMMENT

During the course of this teaching adventure there were many trying, encouraging and instructive experiences These may be briefly summarized as pertaining largely to (1) the students, per se, their initial approach to anesthesia and subsequent development, and (2) the shortcomings and merits of the plan of instruction Most of the officer students appeared to have the preconceived idea that modern anesthesia was still concerned only with the mastering of techniques This notion was not forgotten until lectures were given on pertinent basic sciences, pathologic physiology and the applications to clinical anesthesia A more wholesome respect for anesthesia was then assumed as well as a more interested and mature approach to the field It appeared obvious many times that the lack of knowledge of the fundamental sciences was largely responsible for their inability to appreciate the changing physiology of an anesthetized patient Because of this the basic sciences were emphasized with added fervor in subsequent

courses. This procedure eliminated one of the many important shortcomings of the first course of instruction. The emphasis on pathologic physiology, its direct clinical application and the elimination of controversial subjects and finer but seldom used techniques greatly improved the later courses.

It has been the experience at this post that inhalation anesthesia more than any other method was particularly instrumental in illustrating and emphasizing not only anesthesia and its stages per se but also the basic pathologic physiology underlying some of the significant respiratory and circulatory complications. Because of this fact and particularly because some of the students will be called on in combat areas to resuscitate injured patients showing similar complications, inhalation anesthesia was stressed more than any other technique.

While the number of students who attended lectures in the four courses exceeded seventy-one, only eleven officers and seven enlisted men were given practical instruction. Four medical officers were from Tilton General Hospital and remained on the anesthesia staff after their formal instruction. One each came from the 210th General Hospital and Station Hospital at Fort Monmouth, N. J., and Station Hospital Fort Dix, N. J. The officer at the last named post is now chief of the Section on Anesthesia and is conducting a course in anesthesia at his post. The remaining ones are now on foreign duty. It will be interesting to learn of their experiences and of their continued development as anesthesiologists.

Mimeographed lecture outlines of the course prescribed for officers of station and general hospitals have been requested by many anesthesiologists contemplating instruction of their assigned army or navy personnel. Thus far, sets have been sent to nine medical officers in charge of anesthesia at general hospitals and to twenty-one colleagues in civilian practice at various institutions. It is hoped that these anesthesiologists have similarly enjoyed the pleasant task of instructing officers to safeguard our armed forces by providing safe and satisfactory anesthesia and avoiding its complications and hazards.

TABLE 2—Schedule of Lectures for Officers of Evacuation Hospitals

| Date        | Subject Matter  |
|-------------|---|
| Feb 18 Wed  | —Introduction, purpose, history, scope of anesthesia, records                               |
| 20 Fri      | —Pertinent normal physiology of the cardiovascular, respiratory and central nervous systems |
| 21 Sat      | —Pertinent pathologic physiology: shock, cyanosis, asphyxia, hypoxia                        |
| 23 Mon      | —Local anesthetic agents: spinal anesthesia   |
| 24 Tues     | —The barbiturates: intravenous anesthesia   |
| 25 Wed      | —Opium derivatives: premedication   |
| 26 Thur     | —Stages and signs of anesthesia   |
| 27 Fri      | —Gases and volatile anesthetic agents: inhalation anesthesia                                |
| 28 Sat      | —Common complications of anesthesia: resuscitation and oxygen therapy                       |
| March 2 Mon | —Operating room hazards: fires, explosions  |
| 3 Tues      | —Regional anesthesia: general principles, operative blocks                                  |
| 4 Wed       | —Regional anesthesia: operative blocks (continued)  |

All seven enlisted men of the medical detachment assigned to the Section on Anesthesia had previous training in the biologic sciences. Three finished the first year of medicine, three were professional biologic chemists and the last was a premedical student. Their background proved to be very helpful in their training.

Their development as anesthetists in open drop ether or inhalation techniques was surprisingly rapid and satisfactory. Enlisted men with such qualifications are desirable students and their selection for training in anesthesia might be encouraged at other posts to conserve not only nurse but officer personnel as well.

TABLE 3—Schedule of Lectures for Enlisted Men of Medical Detachment Assigned to Auxiliary Surgical Teams

| Date        | Subject   |
|-------------|---|
| March 9 Mon | —Introduction, purpose, definitions, records, pertinent biology |
| 10 Tues     | —Stages and signs of anesthesia                                 |
| 11 Wed      | —Open drop anesthesia: ethyl chloride, ether, vinylcaine        |
| 12 Thur     | —Open drop anesthesia: technique in detail                      |
| 13 Fri      | —Open drop anesthesia: advantages, disadvantages, airways       |
| 14 Sat      | —Complications—respiratory: recognition and treatment           |
| 16 Mon      | —Complications—circulatory: recognition and treatment           |
| 17 Tues     | —Complications—other systems: recognition and treatment         |
| 18 Wed      | —Operating room hazards: fires, explosions, precautions         |
| 19 Thur     | —Problems in care and transport of operative patients           |
| 20 Fri      | —Review   |
| 26 Thur     | —Written examination  |

It has been my good fortune to be assigned to a post staffed with highly trained and academic minded officers. Their patience and interest have materially aided the plan of instruction. However, to Col S. Jay Turnbull, commanding officer, and to Col Hertel P. Makel, chief of the surgical service, I am particularly indebted for their kind permission to present the first organized didactic course in anesthesiology in the history of the Army and for their suggestions and whole hearted cooperation throughout this teaching adventure.

#### ABSTRACT OF DISCUSSION

DR HENRY S. RUTH, Merion Station, Pa. Major Martin has prepared an outline for instruction of anesthesiology in a branch of the armed forces. His emphasis on the fundamental sciences is, as we know from our experience in civilian instruction, a sound principle and a proved one. It will be interesting to observe however to just what degree this aspect can or should be emphasized under the duress of war. Many factors such as the time element and the necessity for rather rapid changes in personnel should help to determine this for us shortly. In the meantime I feel certain that Major Martin is not neglecting the all important clinical phase. Our medical military forces will be called on to apply certain anesthetic agents and techniques under all sorts of situations and conditions and to be able to do this at all efficiently they must receive as much instruction and practice on the technical side as it is possible to give in the allocated time. Major Martin has mentioned the nonphysician aide. In this group there appear to be available a relatively large number of noncommissioned personnel with some training in the biologic and other related sciences. These men welcome an opportunity to be of service in a branch even remotely related to their previous training as compared to a duty requiring complete dislocation from and contact with their civilian activities. The services in anesthesia already provided by this type of individual appear to be very satisfactory, according to the information gathered from reliable and competent sources. The utilization of such a non-commissioned group would greatly relieve the present great strain on nursing personnel. It is true that military hospital patient material is increasing in numbers, and therefore instruction in military hospitals is a valuable adjunct to civilian instruction. In spite of this change I believe for several reasons that civilian instruction is as acutely indicated at the present

time as it was in 1940. Civilian instruction would do much to provide an increasing number of anesthetists definitely needed for this type of service in the armed forces. The efficiency of instruction given in established centers of anesthesiology does not suffer by comparison with that given in the more recently formed military hospitals. Moreover, the physical status of civilian surgical cases more nearly approximates, it would seem, that of those encountered in combat service, for civilian practice includes anesthesia for patients of lowered physical status, while that in the service, excluding combat zones, deals mainly with individuals with acute surgical conditions, otherwise in excellent physical status, and in the age group possessing a high resistance. Practice on civilian patients should therefore be valuable training for the future care of combat patients, many of whom are in poor physical status as the result of shock, pain, hemorrhage and trauma, and the unavoidable delay of surgical care frequently encountered. Instruction in anesthesia for military application will be placed on a sound basis when a list of the agents and methods available in the field is known. This, I believe, has not as yet been determined or at least not as yet been made public.

DR SIDNEY C WIGGIN, Boston. Major Martin is to be congratulated for accomplishing in a short time what was thought to be impossible—an organized department of anesthesiology to supply modern methods of civilian practice for pain relief for the military casualty. He has established an anesthesia teaching center for medical officers and enlisted men. My thought is that too few physician anesthetists have been trained in civilian practice, so this program is of vital importance to supply the special operating teams to be organized at the different hospital stations in the line of evacuation. I should like to emphasize the importance of empowering the medical officer in anesthesia with the same authority as the surgical officer in the operating units, so that he may carry out the practices in which his special training has fitted him.

DR STEVENS J MARTIN, Fort Dix, N J. I fully agree with Dr Ruth that the time won't be long distant before we shall have to resort to the training of the nonmedical but biologically trained men to fill in the gaps in various units that are being sent out to do anesthesia and operative work in the field. This problem, I believe, will become more and more acute as the war progresses. I thank you for your kind remarks and I hope that we shall have the fortune of seeing other institutions resort to the training of personnel in anesthesia to relieve the rather grave shortage of anesthetists in the armed forces.

**The Common Good of Mankind**—The profession of medicine, having for its end the common good of mankind, knows nothing of national enmities, of political strife, of sectarian dissensions. Disease and pain the sole conditions of its ministry, it is disquieted by no misgivings concerning the justice and honesty of its client's cause but dispenses its peculiar benefits, without stint or scruple, to men of every country and party and rank and religion and to men of no religion at all. And, like the quality of mercy, of which it is the favorite handmaid, "it blesseth him that gives and him that takes", reading continually to our own hearts and understandings the most impressive lessons, the most solemn warnings. It is ours to know in how many instances, forming indeed a vast majority of the whole, bodily suffering and sickness are the natural fruits of evil courses, of the sins of our fathers, of our own unbridled passions, of the malevolent spirit of others. We see too the uses of these judgments, which are mercifully designed to recall men from the strong allurements of vice and the slumber of temporal prosperity, teaching that it is good for us to be sometimes afflicted. Familiar with death in its manifold shapes, witnessing from day to day its sudden stroke, its slow but open siege, its secret and insidious approaches, we are not permitted to be unmindful that our own stay also is brief and uncertain, our opportunity precarious, and our time, even when longest, very short, if measured by our moral wants, and intellectual cravings.

## THE USE OF HUMAN PLASMA IN SPINAL ANESTHESIA

E M PAPPER, MD

AND

E A ROVENSTINE, MD

NEW YORK

During the relatively short history of spinal anesthesia, attention has been focused on two problems in designing technic for placing drugs into the subarachnoid space. The first of these has been to produce the desired extent of anesthesia in a manner predictable and with minimal dangers, the second, to secure the required duration of anesthesia with doses of the agent that provide a wide margin of safety. The latter problem has been approached in several ways. Recently, nupercaine and pontocaine, drugs more toxic but more potent than procaine, have been given in relatively smaller amounts and act for longer periods of time. Retarding the absorption of anesthetic drugs has been attempted by dissolving them in various foreign substances of higher osmotic tension than spinal fluid. Finally, prolonged spinal anesthesia is being accomplished by the repeated administration of relatively small doses of the drug.

The problem of obtaining predictable levels of spinal block has exposed the literature to violent argument. Labat<sup>1</sup> and his school were the chief proponents of the principle of diffusion of drugs (procaine) in the spinal fluid increased as needed by appropriate barbotage. He was able to increase the extent of anesthesia by withdrawing and reinjecting the solution of drug in spinal fluid. Labat criticized the gravity control method of attaining desired levels of anesthesia as unphysiologic and dangerous. On the other hand, the gravity control method has had many advocates, for the use of anesthetic drug mixtures both lighter and heavier than spinal fluid. As early as 1907, Barker<sup>2</sup> described the use of 10 per cent stovaine solution in distilled water to which had been added dextrose in 5 per cent concentration. This solution is heavier than spinal fluid, having a specific gravity of 1.030. He demonstrated with the use of glass tubes shaped according to the natural spinal curves that such a solution obeys the physical laws of fluids and seeks the most dependent parts of the spinal canal. The anesthetic levels obtained clinically corresponded to those observed with the models. Barker pointed out that the viscous properties of this solution restricted the anesthetic drug to definite predictable areas, depending on the position of the patient, where it remained undiffused for a definite period of time.

In 1928 Pitkin<sup>3</sup> described his heavy and light anesthetic solutions. The heavy solution first studied and recommended contained starch and later gliadin, and finally amyloprolamine was used. The latter substance prevented diffusion of the anesthetic drug for two hours. Pitkin's light solution owed its properties to the presence of alcohol. The level of anesthesia was obtained by appropriate postural adjustment of the patient.

More recently dextrose has been the substance commonly employed for gravity control and to prolong anesthetic action using the single dose method for spinal anesthesia. It has been advocated for storvane by Barker<sup>4</sup> for pontocaine by Sise<sup>5</sup> and for procaine by one of us.<sup>6</sup> Finally, blood serum taken from the patient to be anesthetized was used as the solvent for procaine by Bower, Clark and Burns<sup>6</sup> in 1933. This mixture was employed for anesthesia that was not to extend above the umbilicus by taking advantage of the increased specific gravity compared with spinal fluid for gravity control. Motor power remained intact in many patients especially when the levels of anesthesia did not include areas over the umbilicus.

The present preliminary report deals with the use of pooled human plasma as the solvent for procaine employed in spinal anesthesia. The pooled plasma was obtained by centrifugation of refrigerated citrated whole blood with due regard to complete aseptic precautions. The plasma was collected in small rubber capped vials (20 to 50 cc) and stored in the blood bank. Since pooled plasma has a specific gravity of 1.028 it was used as a heavy solution in the gravity control method for spinal anesthesia. Since Barker<sup>4</sup> had previously demonstrated that duration of anesthesia is dependent on the 'viscid' properties of the anesthetic mixture, experiments on man were carried out to determine whether plasma with its high osmotic tension prolonged the anesthetic action as compared with a solution of procaine in spinal fluid.

#### METHOD

Five volunteer normal men who had not been operated on were used in the preliminary investigation. All experiments were performed three hours postprandially at the same time of the day. All had rested in bed for twelve hours prior to the test. Each subject was anesthetized twice, once with procaine dissolved in spinal fluid and then with the same dose of procaine in plasma. Thus each subject acted as his own control. Tests were conducted forty-eight hours apart. Three subjects were given 100 mg doses and 2 were given 50 mg doses of procaine. The technic was standardized as far as possible. A level table was used. Lumbar puncture was performed in the fourth lumbar interspace with the subject lying on his left side. The dose of procaine selected was then dissolved in 2 cc of spinal fluid or 2 cc of plasma, and injection was completed in exactly ten seconds. The subject was turned gradually and gently to the supine position. The sensory level of anesthesia was noted at frequent intervals by response to pinprick, and motor power of the lower extremities was observed at the same time. Two end points with regard to sensory anesthesia were noted: the beginning of recession from the maximum height and the ability to perceive painful stimuli at the level of the twelfth thoracic vertebra. The return of motor power was indicated by any motor activity of the lower extremity.

#### RESULTS

The accompanying table summarizes the observations made. It will be noted that the maximum height of anesthesia obtained by the use of the technic described

was the same for all subjects whether plasma or spinal fluid was the solvent used. In 3 of the 5 subjects the duration of anesthesia at the maximal level was definitely increased by the use of plasma. In the other 2 there was no difference. The total duration of anesthesia, as judged in this report by perception of pain at the level of the twelfth thoracic vertebra, was prolonged in the plasma experiments from 18 to 85 per cent of the control value in 4 of the 5 subjects. The fifth subject exhibited no difference in duration. Anesthesia of the motor nerves was greater in intensity and duration if spinal fluid rather than plasma was used as the solvent for procaine. In 2 subjects the duration of motor anesthesia was less with plasma than with spinal fluid. In one experiment there was no motor anesthesia with either solvent, in another the duration was the same, and finally, there was one subject with motor paralysis for twenty-two minutes when spinal

fluid was used and no motor paralysis when plasma was the solvent. At no time did plasma increase the duration or intensity of motor paralysis. There was no appreciable effect on blood pressure, pulse or respiration in these experiments.

One possible explanation for the potentiation of procaine anesthesia by the use of plasma as a diluent lies in its protein content. Human plasma has an average of 7.0 Gm of protein per hundred cubic centimeters, as compared with 0.02 Gm in spinal fluid.<sup>7</sup> It has been determined that proteins may act synergistically with local anesthetic drugs,<sup>8</sup> but this fact has not been utilized for clinical anesthesia. Other possible mechanisms for synergistic action, which include an increased  $pH$ , increased concentration of potassium sulfate, epinephrine and the addition of purine derivatives, play no part in the phenomena observed. However, the increased duration of sensory anesthesia and decreased motor paralysis may be due largely to retarded absorption of the drug from the plasma solution because of

the presence of relatively large amounts of protein. The whole effect may be influenced to a great extent simply by the difference in specific gravity of the solutions.

#### CLINICAL DATA

After studies on men who had not been operated on were completed, 5 and 10 per cent solutions of procaine in plasma were used for clinical anesthesia for 70 patients. The standard technic of administration using appropriate postural adjustments was employed to attain the desired level of anesthesia with procaine in plasma. The majority of these were subjected to surgical procedures in the lower part of the abdomen and lower extremities. There have been no untoward manifestations during surgical therapy or postoperatively that might be attributed to the plasma. Observations of these few cases have left the impression that dose for dose the duration of procaine spinal anesthesia is prolonged when plasma rather than spinal fluid is the diluent. Predominantly, motor or sensory anesthesia can be obtained easily and as desired by appropriate adjustments of the position of the patient.

### THE CAUSES AND PREVENTION OF SUDDEN DEATH IN CORONARY DISEASE

O. P. J. FALK, M.D.  
ST. LOUIS

Aside from the mounting mortality toll that would appear inevitable with the generally increased incidence of coronary disease, the problem of minimizing the occurrence of fatal complications of myocardial infarction resulting from coronary occlusion, as far as they are subject to control, presents a clinical challenge that can be met only by a careful analysis of the actual immediate causes of death following the occurrence and during the recovery stage of myocardial infarction.

Acute myocardial infarction may occur in the course of coronary atherosclerosis as a consequence of any one of the following circumstances:

1. Thrombosis of a narrowed atherosclerotic coronary vessel.
2. Intramural hemorrhage in a coronary vessel producing closure.
3. Rupture of a subintimal lipid abscess with plugging of the lumen.
4. Infarction occurring without complete organic occlusion of a coronary vessel.

The last mentioned circumstance might be induced by prolonged coronary insufficiency, such as a protracted anginal seizure, resulting in a sufficiently sustained ischemia to produce an area of infarction in a myocardium already undernourished from coronary sclerosis. In contrast with this, one occasionally encounters a situation in which the obliterative process of a coronary vessel has evolved so gradually over a period of years that channels of collateral circulation may have developed to an extent sufficient to prevent infarction even when the partial coronary closure does eventually become complete.

In any event it is the myocardial ischemia and ensuing infarction consequent on acute coronary occlusion that plays the dominant role in the clinical picture and presents the important implications in the prognosis and management of the attack. The outstanding indications for therapeutic management include (1) prompt and effective relief of pain, (2) control of shock, (3) efforts directed toward limitation of regional coronary vasoconstriction and (4) the problem of bringing to bear what influences one can to offset certain critical and oftentimes fatal complications attendant to the period of recovery.

#### PROMPT RECOGNITION

Any comprehensive discussion of the management of the sudden attack would be incomplete without emphasizing the signal importance of prompt recognition of an impending occlusion. One's clinical perception must ever be on the alert not only for the atypical attack, often without pain, but also to interpret the significance of increasing frequency, severity and duration of anginal attacks in a subject with coronary disease, particularly when brought on by ever diminishing degrees of stress or even perhaps during rest.

#### MANAGEMENT OF THE ATTACK

Confronted with a clinical picture of coronary occlusion, one's first consideration should be the relief of pain. Intravenous injection of papaverine followed by morphine, if necessary, not only accomplishes this objective promptly but appears to minimize shock and may even serve to limit coronary vasoconstrictor reflexes, with all the implications that such action may have on the extent of the resultant myocardial infarction. Attenuation of vagus vasoconstriction by the use of atropine would likewise appear a sound measure to employ, even when no more than a well founded suspicion of threatened occlusion or infarction exists. The antifibrillation effect of papaverine hydrochloride, as shown by Lindner and Katz<sup>1</sup> in experiments on dogs, appears to justify the clinical use of this opium alkaloid in conditions which are apt to lead to ventricular fibrillation. These investigations have shown that papaverine hydrochloride, in addition to being a powerful coronary vasodilator, makes it much more difficult to induce ventricular fibrillation by faradic stimulation. It would appear that the protection of uninvolved areas of myocardium from vasoconstrictive reflexes which might either extend the area of infarction or induce fatal ventricular fibrillation would constitute the rationale for the prompt use of vasodilatory drugs in acute occlusion.

The work of Manning, McEachern and Hall<sup>2</sup> on coronary artery reflexes accompanying experimental coronary ligation in the dog showed that occlusion of a coronary artery is often followed by a reflex spasm of collateral coronary vessels. Their experiments further suggested that this regional spasm produced an area of ischemia and resultant infarction appreciably larger than would be anticipated from ligation of the particular vessel itself. They conclude that reflex spasm in the regional arterioles following acute occlusion enhances myocardial ischemia and subsequent infarction.

In the purely anginal attacks of coronary atherosclerosis constriction of the regional arterioles is thought to

From the Department of Medicine, St. Louis University School of Medicine.

2. Manning, G. W., McEachern, C. G. and Hall, G. F. I. Coronary Artery Spasm Following Sudden Occlusion of One of the Branches. *Arch. Int. Med.* 64: 661 (74) (Oct.) 1937.

and responds to nitrites or to alcohol. In the event of sudden permanent occlusion the same regional vasoconstriction appears to take place, the effective control of which may have a signal effect on the size and immediate outcome of the impending infarction. LeRoy and Snider demonstrated that after coronary ligation in dogs there is a generalized coronary vasoconstriction subsequent to the myocardial infarction. This seemed to be the factor bringing about ventricular fibrillation which appeared to be the immediate cause of death in animals succumbing to the experiments. In a large group of their animals the average mortality following ligation of the circumflex branch of the left coronary was 75 per cent. This mortality was reduced to 35 per cent with intravenous atropine sulfate and to 30 per cent with atropine sulfate and aminophylline together.

The accepted clinical management of acute coronary occlusion with morphine given hypodermically rest and oxygen when immediately available, all too frequently entails distressing delay in the control of pain and anxiety. This protracted distress undoubtedly influences the degree of resultant shock aside from the possibility of influencing the ultimate area of infarction. Based on Allen's<sup>3</sup> suggestion in 1935 that papaverine given intravenously be tried in coronary occlusion because of his observations on its effect in controlling widespread regional arteriolar spasm in sudden occlusions in the leg and also McLachlan's<sup>4</sup> observations that intravenous injection of papaverine lowered by one third the mortality of dogs following coronary ligation I have been giving from  $\frac{1}{2}$  to 1 gram (0.03 to 0.06 Gm.) of papaverine intravenously in all coronary attacks more severe than the transient anginal type responding to nitrites. When papaverine does not induce adequate relief from pain it can be followed up with a very slow, careful intravenous injection of from  $\frac{1}{8}$  to  $\frac{1}{4}$  gram (0.01 to 0.016 Gm.) of morphine (diluted with 2 cc. of sterile water). Aside from the possibility of some control of regional vascular spasm the prompt relief of pain, as compared with the agonizing delay so many physicians have witnessed while waiting for the protracted response to two or three successive hypodermics of morphine should tend to minimize the shock, to say nothing of the anguish attendant on the seizure.

#### CAUSES OF SUDDEN DEATH

Among the immediate causes of sudden death whether in the throes of the coronary attack or during the period of recovery are such complicating factors as ventricular fibrillation, myocardial failure and pulmonary embolism.

#### VENTRICULAR FIBRILLATION

The occurrence of ventricular fibrillation at the moment of death in sudden fatalities following myocardial infarction has been reported by several observers who happened to be taking electrocardiograms at the time of death. Autopsies in these cases failed to reveal any other sufficient cause.<sup>5</sup>

The occurrence of frequent ventricular extrasystoles following myocardial infarction is conceded to be an ominous sign. It has been observed that the more frequently they occur the greater is the probability of sudden fatal termination. It is the opinion of several observers that infarcted areas of myocardium are hyperirritable and constitute the foci of ectopic beats which by their summation might lead to ventricular fibrillation. Woods and Barnes<sup>7</sup> report that groups of patients having more frequent premature contractions have a higher mortality rate. Of the patients who had one premature ventricular beat in every ten 14 out of 17 died, whereas all of the group who had but one in twenty or more survived.

With the mechanism of sudden death from ventricular fibrillation in mind, Borg<sup>8</sup> in view of the rather general opinion that ventricular fibrillation is considered a frequent cause of sudden death in arteriosclerotic heart disease attempted to reduce the tendency to this fatal rhythm by giving all patients admitted to the Ancker Hospital with degenerative heart disease (including hypertensive coronary and aortic valvular types) 3 grams (0.2 Gm.) of quinidine sulfate three times a day. Before the institution of this routine among 22,490 admissions over a two year period there had occurred 42 sudden deaths, 80 per cent of the patients who died suddenly had degenerative heart disease. The following year when quinidine was given in such cases routinely, Borg reported only 5 sudden deaths. This observation at least suggests that all patients with degenerative heart disease are in danger of sudden death which is apparently minimized by the routine use of quinidine sulfate and it would seem to justify such a measure in the treatment of acute myocardial infarction, more particularly when there are frequent premature systoles, which circumstance appears to present greater danger of fatal ventricular fibrillation. The prophylactic administration of quinidine sulfate soon after the onset of myocardial infarction to prevent ventricular tachycardia and fibrillation has been advocated by several writers.<sup>9</sup> As a myocardial depressant quinidine seems a better prophylactic agent against ventricular fibrillation than a curative one.

#### MASSIVE PULMONARY EMBOLISM

Another immediate cause of death which occurs in an important percentage of cases following acute coronary occlusion with myocardial infarction is massive pulmonary embolism. These pulmonary emboli do not usually come from mural thrombi in the heart but apparently from thrombi originating in the iliac veins. Such massive pulmonary embolism accounted for 6 of the 60 deaths occurring in the series of 128 cases of acute myocardial infarction reported by Woods and Barnes<sup>7</sup> in 1941. Hines and Hunt<sup>10</sup> report that 30 per cent of 161 autopsies on arteriosclerotic heart disease subjects showed pulmonary infarction. This high incidence should be kept in mind in the management of certain

types of cardiac disease. During the convalescent period of myocardial infarction, circumstances would appear favorable for the formation of thrombi in the iliac veins consequent on the lowered blood pressure and the necessarily prolonged period of bed rest.

In this connection the observations of Potts<sup>11</sup> are of interest. He became convinced many years ago that venous stasis was the most important factor in venous thrombosis and accordingly since 1928 has used the following routine in all surgical cases under his care, beginning twenty-four hours after operation: "Have the patient take fifteen deep breaths morning and evening and with each deep breath passively or actively flex the legs." Potts uses this routine among adults not too weak or too seriously ill to carry out the order, which of course would be the condition in the immediate post-infarction stage of most attacks of coronary occlusion. In the years during which this routine has been carried out, among 518 adult surgical patients Potts<sup>11a</sup> reports not a single instance of pulmonary embolism or even thrombophlebitis, except in fractures of the upper leg in which immobilization rendered flexion of the leg impossible. Among this group he has had 5 patients with pulmonary embolism. Deep inspiration, elevation of the leg and muscular contraction obviously assist in sweeping out the pelvic and femoral veins, thus reducing the venous stasis which is conceded to be such an important contributing factor in the formation of thrombosis and subsequent embolism. The value of leg exercises in the prevention of postoperative embolism is also emphasized by Welch and Faxon<sup>12</sup> in a recent report. That this precautionary measure might be worth utilizing in the relative venous stasis following in the wake of myocardial infarction would appear logical, particularly in the light of Woods and Barnes's observation that 10 per cent of their coronary deaths were attributable to massive pulmonary embolism.

This routine in convalescent coronary management has been established in my service beginning on the fourth or fifth day, the number of exercises being varied from eight to ten according to the patient's condition. For the first few days the legs are flexed passively by the nurse or attendant, the patient folding his hands behind his neck for the deep breathing exercises.

#### MYOCARDIAL FAILURE

Another cause of fatality within the immediate recovery period following acute myocardial infarction is myocardial failure associated with severe pulmonary edema and occasionally with acute hepatic congestion. Indications for management of this complication include the judicious and careful use of digitalis, parenteral aminophylline and adequate oxygen therapy. The use of aminophylline as a routine measure in myocardial infarction is a debatable question. Aside from its parenteral use in the prodromal or early stage of an infarction complicated by signs of congestive failure,

I do not use aminophylline until after the first week of convalescence, when it is given by mouth, along with quinidine and phenobarbital.

#### MYOCARDIAL INFARCTION AS A SURGICAL COMPLICATION

Coronary occlusion is not infrequently the cause of sudden death in arteriosclerotic subjects during surgical anesthesia and the early postoperative period. The reduction in blood pressure occurring in that period presents an ideal situation for an already impaired coronary vessel to develop complete occlusion. This possibility would appear to justify a painstaking preoperative appraisal of coronary efficiency and a clinical estimate of myocardial and coronary reserve, by a careful inquiry into the middle aged or older patient's apparent ability to meet the demands of his everyday life, as well as a comprehensive evaluation of the objective clinical, x-ray and electrocardiographic findings.

Naturally the proper choice of anesthetic and careful observation and management during anesthesia and the immediate postoperative period is imperative. It would appear good judgment to reduce the time of any surgical procedure to a minimum in the presence of suspected coronary insufficiency. One must continue to bear in mind the danger of medical and surgical shock as an immediate precipitating factor in the production of coronary thrombosis in cases in which evidence suggests that disease already exists in the coronary vessels.

#### SUMMARY AND CONCLUSIONS

The syndrome usually termed coronary thrombosis or coronary occlusion, consisting of prolonged substernal pressure or pain and accompanied by a fall in blood pressure, shock, pallor, characteristic electrocardiographic changes, fever, leukocytosis and increased sedimentation rate is in reality the result of the myocardial ischemia and ensuing infarction that follows acute coronary occlusion. This is particularly significant since it is recognized today that myocardial infarction may develop and produce classic symptoms without actual permanent structural occlusion of a coronary vessel. Such a circumstance may follow a severe, prolonged, anginal seizure and be associated with all the symptoms described, resulting from prolonged insufficiency of the blood supply to a particular myocardial sector and consequent protracted local myocardial anoxemia. Such coronary failure may result in myocardial infarction, which under certain circumstances might be averted by prompt intravenous administration of papaverine or morphine, with atropine and perhaps aminophylline, along with absolute rest and oxygen. When sudden complete occlusion makes myocardial infarction inevitable, it would appear within the realm of possibility that such measures might minimize the ensuing shock, if not the area of myocardial infarction, and possibly avert fatal ventricular fibrillation.

The mortality of acute coronary occlusion with myocardial infarction might well be favorably influenced by the early recognition of impending infarction and the institution of adequate protective therapy without delay. Furthermore, the dangerous complications that often characterize the immediate or later recovery period of an acute coronary attack should be borne in mind and adequate protective measures instituted in our therapeutic management of the episode.

## Clinical Notes, Suggestions and New Instruments

### ANEURYSM OF THE ANTERIOR CEREBRAL ARTERY

WALTER E. DANDY, M.D., BALTIMORE

During the past decade intracranial aneurysms have been added to the group of lesions that are curable by operation. I now have cured 15 patients with aneurysms of the internal carotid artery arising in the cavernous sinus and along the intracranial course of this vessel. The treatment of aneurysms of the internal carotid artery is relatively simple, it being necessary only to isolate the aneurysms between ligatures or silver clips or to clip the neck of the aneurysms when they lie within the cranial chamber.

Herewith is a report of an aneurysm of the anterior cerebral artery. As it is one of the most common aneurysms of the brain and one with a fairly easy approach, the hope is entertained that the surgical attack will become increasingly more frequent. Up to the present aneurysms of other arteries in the brain have not been cured, but doubtless with time the list will be increased.

#### REPORT OF CASE

A well nourished normal looking woman aged 45 was referred by Dr. Robert Sullivan of Murfreesboro, Tenn., Dec. 1, 1941, because of defective vision.

Her only complaint was loss of vision which began two months before and had steadily increased. There had been no headaches.

Dr. Alan C. Woods examined the patient's eyes and found (1) visual acuity to be 15/200 in the right and 20/70 in the left eye; (2) loss of all color vision in the right eye; (3) central scotoma in the right eye; (4) suggestive altitudinal hemianopsia for form in the right eye; (5) some pallor of the right optic disk; (6) central scotoma for color in the left eye; and (7) only a small field for colors remaining in the left eye.

The blood pressure was 120 systolic and 85 diastolic. The Wassermann reaction of the blood was negative and roentgenograms of the head were negative.

The diagnosis was a tumor in the suprasellar region; an aneurysm was not suspected.

An operation was performed on December 3. A right hypophysial approach was made with a concealed incision. There was no increased intracranial pressure. Less than 0.5 cm. from the optic foramen the optic nerve began to show a brownish red discoloration and was increased in size. My first thought was that this was a glioma of the optic nerve and chiasm. The internal carotid artery lay alongside for a distance of probably 3 cm. was free of any attachment and looked perfectly normal. The space between the artery and the nerve was inspected but extension of the tumor was not seen. On further withdrawal of the frontal lobe for inspection of the chiasm a large mass was seen extending upward into the base of the brain. It was smooth and well rounded and was certainly not a glioma. Suspecting that it was a tumor, I incised the capsule and made an attempt to curet the interior, but the content was so hard that the curet made no impression on it. Since it was firmly attached to the right optic nerve and a line of cleavage could not be found, I cut away the upper half of this nerve, freeing the presumed tumor just before the chiasm was reached. The incised bed of the nerve was about 0.75 cm. long, approximately the upper half of the optic nerve had been excised. With very slight traction on the incised capsule the mass was lifted slowly and with no apparent point of fixation. After a little progress, however,

the wound suddenly filled with blood. I suspected that the internal carotid might have been torn and promptly passed a silver clip through the blood and closed it. The blood was then aspirated and it was seen that the bleeding had completely stopped. With gentle dissection the tumor was separated from the optic chiasm and lifted out of its bed; no further bleeding resulted. The tumor was then recognized to be an aneurysm. An opening in the wall as large as the end of a lead pencil was the source of the sudden hemorrhage. The aneurysm could have arisen only from the right anterior cerebral artery. However, at no time was this vessel actually seen and curiously no bleeding appeared from it subsequently, although only the internal carotid artery had been ligated.

The aneurysm was about the size of a bantam's egg. It was the shape of a dumbbell and the upper part was about

A drawing of aneurysm. B upper half of optic nerve excised at point at which aneurysm was firmly attached. C sketch showing the approximate location and relative size of aneurysm, also the relative thickness of the thrombus and size of the cavity. D drawing of aneurysm after its removal. The opening where it was attached to the right anterior cerebral artery is shown.

twice as large as the lower part. The constriction between the two parts was at the level of the optic chiasm, behind which it lay.

The upper portion protruded upward between the two frontal lobes and the lower portion passed back of the optic chiasm and must have rested on the sella turcica. There was only a small cavity in the aneurysm, this connected with the opening on the exterior, at which point the attachment to the trunk of the anterior cerebral artery had been torn off. The larger upper subdivision of the aneurysm was white and the lower half was black, the striking difference in color was due to the age of the contained thrombus, the upper part being quite old and very firm and the lower part being fresh and softer. The cavity in the aneurysm was entirely in the upper part. The weight of the aneurysm was 16 Gm.

Fortunately the Matas test had been made before the operation and was negative. This test is now routinely performed on every patient whose lesion is in the environs of the sella, because a number of aneurysms have been encountered when tumors were suspected. Without a prior knowledge of the adequacy of the collateral circulation through the circle of Willis, closure of the carotid artery would be taking a serious risk, although in this case the risk was inescapable. There can, I think, be no doubt that the cerebral circulation on the right side of the brain is now maintained solely through the posterior communicating artery.

On coming out of the anesthesia (about two hours after the operation was concluded) the patient had half a dozen convulsions on the left side, but there was no weakness of that side of the body then or at any time subsequently. The following day she was in excellent condition, quite alert, happy and apparently normal in every way. Nine days later when asleep she apparently had a convulsion and broke open the wound, this was immediately closed, no one was in the room at the time of the convulsion. There was no subsequent weakness of the left side, but she was disoriented and less alert for three or four days thereafter. I assumed that the convulsion and the after-effects were the result of necrosis of the brain from loss of the anterior cerebral artery. This may or may not be true, but it appears to resemble a similar state that at times follows the operation of Freeman and Watts in prefrontal lobotomies.

The patient left the hospital December 21, eighteen days after the operation. Mentally she was as well as before the operation. A complete third nerve paralysis has persisted since the operation, doubtless owing to an injury sustained when the internal carotid artery was closed, this was entirely unexpected, since bleeding was controlled quickly and seemingly without trauma.

Vision in the right (affected) eye was practically unchanged, the same visual field with a central scotoma and altitudinal hemianopsia remained, and visual acuity was 20/400. I was prepared to believe that vision would have been lost after excision of at least the upper half of the nerve with the firmly attached aneurysm. The vision in the left eye was definitely improved, the visual acuity was 20/20, the central scotoma had disappeared and the color fields, which were barely present alongside the central scotoma, were normal (examination of the eyes was done by Dr Woods). On Jan 15, 1942 (six weeks after the operation) she was reported to be in excellent health, and her vision was good.

Johns Hopkins Hospital

#### MALIGNANT MELANOMA

R. H. RULISON, M.D., NEW YORK

Mrs. L. A. S., a red haired, freckled housewife aged 24, referred to me by Dr. L. J. Perenyi on Sept 13, 1930, had had four nonhairy, brown moles in the interscapular region since infancy. These lesions were separate and were grouped in an area of skin no larger than a silver dollar (38 mm). All were slightly raised. The mole farthest to the right was darker and more prominent than the other three. During the preceding two months this mole had become still darker, was raised about 1 cm above the skin level, had bled after slight scratching, and a small ulceration had developed which did not heal. There had been no change in the three other moles.

A consultation with Dr. Howard Fox was arranged on the same day. It was decided that the entire group of moles should be removed by electrodesiccation, the removal to be wide and deep.

On September 13, under procaine hydrochloride anesthesia, the entire group of moles was removed *en masse*, the full thickness of skin and considerable subcutaneous fat being included. The excised tissue was submitted to Dr. J. Frank Fraser for microscopic examination. On September 24 he reported as follows: "Section of the tumor which you sub-

mitted for microscopic examination show anaplastic cells infiltrating the epiderm and lymphatic vessels of the corium. Histologic diagnosis, malignant melanoma."

The wound healed by granulation. On November 11 it was entirely healed. On March 17, 1931 there was a satisfactory, smooth, soft scar. On Sept 14, 1931, one year after operation, there was no sign of recurrence. On June 29, 1932 the patient returned, worried about a blackhead at the edge of the scar. The comedo was expressed and the patient reassured.

In 1935 the patient gave birth to a daughter, her only child.

In January 1940 the patient noticed an enlarged gland in her left axilla. On March 9 she consulted Dr. Julius Gottesman, who found a mass of glands in the left axilla which suggested a primary cancer of the breast. Careful examination of the breast, however, did not reveal any abnormality. The patient failed to tell Dr. Gottesman of the operation on her back in 1930 or of the pathologic diagnosis made at that time, which she and her husband both knew.

Dr. Gottesman operated on the patient at the Sydenham Hospital on March 14, 1940 for removal of axillary glands. A pathologic report by Dr. Arthur Ginzler of the Sydenham Hospital showed metastatic melanocarcinoma.

The axillary growth recurred. Definite pulmonary metastases were demonstrated by roentgenograms. The patient died in November 1941.

This report is of interest because of the long interval (nine years and three months) between removal of a malignant melanoma and the appearance of metastatic growths.

147 East Fiftieth Street

### Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT  
HOWARD A. CARTER, Secretary

#### FARIES SUNLAMPS, MODELS 2434, 2435, ACCEPTABLE

*Manufacturer* Faries Manufacturing Company, Decatur, Ill.

The Faries Sunlamps, Models 2434 and 2435, employ the Council accepted Westinghouse Mazda RS Sunlamp Bulb (THE JOURNAL Dec 6, 1941 p 1979). This bulb incorporates a sealed-in reflector, no transformer is required.

Following is a description of Faries Sunlamp, Model 2434.

Lamp Mazda RS type bulb  
Finish Shade, base and standard, gray ripple flexarm and trim satin nickel  
Base Diameter 10½ inches height 2½ inches, contains switch  
Reflector Diameter 9¼ inches depth 4 inches  
Overall Height Height 52 inches  
Extension 34 inches to 50 inches from bottom of shade to floor  
Flexible arm extends 11 inches to center of shade  
Wiring Ten feet of approved rubber covered cord with approved socket and unbreakable rubber plug

Following is a description of Model 2435.

Lamp Mazda RS type bulb  
Finish Shade and base rippled bronze, standard and arm statutory bronze  
Base Diameter 11½ inches height 5 inches Contains switch  
Height Overall 60 inches To bottom of shade 50 inches  
Adjustable Bottom of Shade to Floor From 38 to 54 inches  
Reflector Diameter 9¼ inches depth 4 inches  
Arm Extension Ten inches to center of shade  
Adjustment Ratchet joint at top of vertical shaft permits various adjustments  
Wiring Ten feet of approved cord with approved socket and unbreakable plug

A minimum perceptible erythema is obtained with the Westinghouse RS type bulb in approximately five minutes at 24 inches.

The Council found that Model 2435 was mounted on a more stable base than Model 2434.

The Council voted to accept the Faries Sunlamp Models 2434 and 2435, for inclusion on its list of accepted devices.

## MEDICAL EDUCATION AND THE WAR

### A SERIES OF ARTICLES BY FEDERAL AUTHORITIES RESPONSIBLE FOR MEDICAL SERVICE IN CONNECTION WITH THE WAR

#### UNITED STATES ARMY

Major General James C. Magee  
Surgeon General Medical Corps

The inventions and scientific discoveries of the machine age placed at man's disposal powers not alone to build but also to destroy with an insensate fury beyond the imaginings of his forebears. Armed conflict has ceased to be an affair reserved to the professional soldier but instead has become the pitiless total war of the modern day, which affects the life and destiny of every citizen of a belligerent state.

The increasing complexities of modern warfare have evolved armies intricately organized and precisely coordinated, which are created welded and steered for a single end. The problems confronting an army, including those relating to medical science differ widely from the problems of a civil population. The evolution of highly trained general and special staff officers for the management of these issues has inevitably resulted. Among the special staff officers there has appeared, in all the armies of the great powers, a medical specialist—the military surgeon—to meet the changing situations. Unless this new development is clearly appreciated, the problem of the medical welfare of the army will be viewed in terms only of the medical and surgical treatment of the sick and wounded.

The duty specifically charged to the Medical Department of the Army is the conservation of the manpower of the military forces. Such a coldly factual statement presents no concept of the far flung organization which is in active operation to fulfil the task. Unseen is the agency endowed with special powers which reaches into the nation's industrial centers to take the vast quantities of materials needed for the professional care of the Army, whether on the battlefield or in the large modernly equipped military hospitals in the homeland.

Unsuspected is the corps of experts specially trained in preventive medicine and sanitation who have visited and studied unheralded and frequently secretly, regions often remote and strange, where history may decree that the fate of the nation shall be irrevocably decided. Likewise there is no suggestion of the many research projects which are being conducted by or at the behest of the Medical Department, to the solution of which the nation's most prominent medical scientists are devoting their attention. These examples suffice to emphasize the fact that the military service presents outlooks and issues which have no counterpart in civilian practice and which necessitate specialized knowledge in the field of medicomilitary practice.

From the inception of mobilization to the completion of demobilization, the Medical Department is intimately concerned in every factor which affects the health of the Army. Furthermore, the Medical Department is the only organization which is represented in every echelon of the combat organization from the attack wave at the forefront of the battle through all the intermediate steps to the zone of the interior. This is due to the fact that medical service must be continuous from the moment and place at which the soldier falls to his final destination and disposition.

The duties specifically charged to the Surgeon General by regulations fall under three main headings

1 The selection of the prospective soldiery to make sure that only those are accepted who are physically fit to endure the rigors of warfare

2 The preservation of the health of the able bodied in the military service.

3 The restoration to health of those who become sick or are injured and wounded. This duty includes all the facilities (installations, supplies, vehicles) and aid (medical field units, location, collection and transporting wounded) necessary for the evacuation and hospitalization of military personnel.

Brief as such an outline of functions may be, it is at once apparent that it includes responsibilities and activities far beyond the scope of medical practice in civil life. The Army is invested with incomparably greater power to control its component elements and the environmental surroundings than civil communities. This power operates at the very outset to establish the characteristics of the group—the nature, composition, size and functions. It then selects from the civil population the desired number of individuals who appear to meet these basic requirements and even fixes their status and relative standing in the group as a whole. In the process of selection the Medical Department naturally takes one of the leading roles, since health and vigor are indispensable attributes of those who must serve in the armed forces.

This work is therefore of great importance. Clearly before an Army itself exists, its nature and health are already partially determined by the standards of quality prescribed and the effectiveness of the selective process put into operation. Planning and devising an efficient system of selection consume months, later to be followed by the enormous labor of conducting the physical examination of millions of men.

Infectious diseases have decisively influenced the entire course of history. Civilizations have waned or vanished for lack of knowledge of the methods to control the plagues which, throughout generations, destroyed millions of human lives without check. The scientific investigations of the past century, however, completely altered the outlook. The vital importance of the new science of preventive medicine was early recognized by the armed forces of all world powers, as a matter of course. No modern army would be able to carry out its mission successfully or indeed to survive for any length of time under combat conditions without the protection from disease which it enjoys in great measure by the unrelenting campaign directed against the outbreak and spread of infectious disease.

An immense amount of study has been devoted to preventive medicine by military surgeons, for whom it occupies a position of paramount importance in the maintenance of the armed forces at maximum physical efficiency. The United States Army has played a leading role in this field of investigation from the earliest days, and, as a result, some of the greatest advances in medical knowledge in preventive medicine have been contributed by medical officers of our army. The work of the immortal Walter Reed on yellow fever, which made possible the building of the Panama Canal, is a particularly brilliant example. A recent example, interesting because of its contribution to the problems of national defense, is the research work conducted by the Medical Department of the Army in Trinidad involving a tiny mosquito of peculiar habits which lives in the air plants growing in the high branches of the giant *immoitelle* trees used to shade cocoa plantations. In 1941, proof of its role in the transmission of malaria resulted from a special study. Now a program of control is under way.

Every member of the United States Army is now vaccinated against typhoid and the paratyphoid fevers, smallpox, tetanus and yellow fever. Immunization to the latter two diseases has been made possible only by

recent advances in medical science. In fact, the United States Army is the first in history to put into effect universal vaccination against the much dreaded yellow fever. The Medical Department is also fully prepared to immunize troops against typhus fever, bubonic plague and cholera, should these measures be indicated.

The infinite variety and complexity of problems attached to the physical selection of individuals which are to compose the Army and the preservation of the health by every means possible of those accepted are matters which are not common to the experience of the civilian practitioner. Special knowledge and training are requisites to the undertaking of responsibilities of such vital importance to a nation whose very existence is committed to the physical welfare of the men under arms, who must withstand hardships to the limit of human endurance.

The professional services rendered in army practice do not differ materially from civilian practice. The Army is operating a huge system of hospitals with an immense total number of beds distributed over half the globe. Some of these hospitals have a bed capacity of two thousand. There is ample clinical material to provide experiences ranging from obscure tropical diseases to those of the arctic zone, from those on the surface of the earth to those occurring in the stratosphere, and from those on the surface of the body to those inside the peritoneal cavity.

A unique feature of the professional work is the fact that for the most part it deals with a selected population of vigorous young males. Naturally, this has certain disadvantages as well as its great advantages. Acute medical and surgical conditions predominate. The astonishing recuperative powers of the body are naturally brought to the fore, and recovery is the rule. As evidence, note the fact that the death rate has been extraordinarily low in the expanded army. The knowledge of human nature gained by contact with the American soldier is worthy of some emphasis. His uniqueness is something an officer never would wish to forget.

However great may be the professional eminence of the doctor in uniform, it avails nothing to the wounded soldier lying unattended where he fell on the battlefield. How can the wounded receive the fullest benefits of the physician's art? This problem is the specific responsibility of the medical officer to solve. Between medical skill, however, and the utmost need it must serve lies the shattering tumult of the conflict and roads urgent with forward moving troops and weapons pressing hard against the supreme hour of decision.

To reach and evacuate a wounded soldier amidst this chaotic devastation of the battlefield is one of the most difficult tasks which confront the military surgeon. It can be achieved effectively only by those who are brave and resourceful and are versed in the tactics of warfare. As in every other field of human activity, only the well informed are competent to undertake the grave responsibility. It is this special military knowledge and training which distinguishes the competent military surgeon in the armies of the world from the doctor who is wearing a uniform but who possesses no other attributes of a medical officer. The purpose and plan of the Reserve Officers Training Corps in the curriculum of a university is precisely to impart the education in military art and tactics indispensable to the performance of duties of the military surgeon. On account of the service they perform in this connection the War Department has every intention of continuing the R. O. T. C. training.

The planning, creation and operation of the vast organization required for the evacuation and professional care of the wounded is in itself an undertaking of greatest magnitude. As late as the sixteenth century no provision was made for the medical care of military casualties. Commonly they were put to the sword by the able bodied friend or foe alike or were left to suffer at the hands of ghouls. Not until the American Civil War was an effective system devised for the orderly evacuation of wounded from the battlefield and early treatment behind the lines. The organization set up at that time by an army surgeon Jonathan Letterman, has become the basic pattern on which is constructed the field medical service of all the great powers. The first world war demonstrated anew that this function is one of the most important phases of the medical service of the theater of operations. Identification of the wounded, immediate first aid by trained personnel, treatment of shock during the evacuation and arrival at an evacuation or surgical hospital in the best operative condition greatly reduced the battlefield mortality, saved many from disabling after results and cleared the forward areas of unattended wounded.

The fact that military medicine has made great advances since 1918 was dramatically portrayed by the phenomenal results obtained in the medical and surgical care of the wounded after the attack on Pearl Harbor. Carefully planned methods of evacuation, the employment of drugs of the sulfonamide group and the administration of blood plasma were the chief features. Wounds healed rapidly and cleanly. Massive infection, which was the rule in World War I, was conspicuous by its absence. Less than 4 per cent of the cases of extensive wounds, including compound fractures, became infected even to a mild degree. The mortality from perforating wounds of the abdomen, which previous experience had demonstrated to be 80 per cent of all cases, was practically nonexistent. Many men have already returned to duty who would be facing the prospects of long continued hospitalization if they had not been afforded the benefits of the newest methods of treatment.

The morale of troops in combat is profoundly affected by the quality and promptness of the medical service rendered to them. The key man in this heavy responsibility is the battalion surgeon, who serves with the front line troops and is the first physician under whose

administrations the wounded come. It is his high mission to rescue them from the furious inferno. If he fails, the morale of the troops falters and fails. More, the entire organization of medical evacuation from front to rear ceases to function. The task requires physicians of stout heart and deep understanding.

The question of occupational classification and deferment from the draft is, naturally, one which is of great concern to premedical and medical students. A program has been devised to defer, until completion of one year of internship, students who meet all qualifications.

Premedical students in universities and colleges with acceptable standards may be enlisted in the Enlisted Reserve Corps under the "Pre-induction Training Plan" by passing a qualifying examination. The details of this plan are obtainable from the Dean of the educational institution or from the Commanding General of the Corps Area in which the student is pursuing his course of instruction.

On graduation from the premedical course those who have been enlisted in the Enlisted Reserve Corps may, upon application, be discharged from their enlistment and commissioned as Second Lieutenant, Medical Administrative Corps, Army of the United States, when they have been matriculated in an accredited school of medicine and can produce the certificate of the dean of the school to that effect. This commission may be held in force throughout the period of medical education so long as it is successfully and continuously pursued. In the last year of instruction in the course of medicine, application may be made for a commission as First Lieutenant in the Medical Corps, Army of the United States, and upon certification of the dean, three months prior to the date of graduation, to the effect that the student is expected to graduate he may be granted the commission for which he applies. Following this change in status, the student may be permitted to pursue an internship of twelve months' duration which must commence immediately after graduation.

Those who have been afforded the protection of this preinduction training plan should not anticipate continued deferment if they fail to enter upon an accredited internship very shortly after graduation. It is not to be expected that exemption will be continued in the case of those who unduly delay commencement of an internship, and are, therefore, not engaged in occupational or educational pursuit for which this entire plan was conceived.

## UNITED STATES NAVY

Rear Admiral Ross T. McIntire

Surgeon General Medical Corps

In preparing for a medical education it has been considered good practice for the premedical student to have four years' college work, which includes certain definite subjects considered necessary as a groundwork in the study of medicine. There is a very definite doubt in our minds whether it is right or desirable at this time to say that a young man who wishes to study medicine must spend four years in a college, four years in medicine and one year as an intern before he may enter one of the military services. Our educators can give this very serious consideration.

Since we must look to our premedical students to provide the bulk of the personnel in our colleges of medicine throughout the country, it has become necessary to find some means to protect these boys while

they are in school. Here again a great deal of common sense has been used in allowing us to work out a sensible program. The Navy is enlisting first and second year premedical and pre dental students in Class V-1 of the U S Naval Reserve. These men are eligible for transfer to Class V-7 on completion of their second year and, on acceptance for admission to an accredited medical or dental school, are eligible for appointment to Class H-V (P) U S Naval Reserve. Should he fail to qualify in medicine, he still retains his Reserve status as an enlisted man in the Navy and is eligible to serve at once in that organization. In this way the boy has had an opportunity to continue his college work, and the service has a potential candidate at all times.

In our opinion it is a fine thing to interest the young man in the Navy while he is a premedical student, for by so doing he will increase his interest in certain branches of medicine, such as tropical diseases, preventive medicine and military medicine. It is the observation of competent officers in the Army and in the Navy that the average medical student, coming into the services, is not well grounded in any of these three subjects. The medical educators of this country recognize this and are taking vigorous steps to see that this defect in our educational system is corrected and some uniformity applied.

It had been the plan of the Navy, when this Special Class, Ensign H-V (P), U S N R, was organized, to call the medical student to active duty during the vacation period and give him an opportunity to see active service in a naval hospital, on a hospital ship or on a combatant ship. Now that the accelerated program has been put into effect, this cannot be done, but should we find that they go back to a more orderly system, whereby we have a certain vacation period, the Navy plans to put this practice into action at once.

Very naturally the Army and the Navy will commission in the Special Class Reserve more medical students than they can give internships to. The excess, however, can be given internships in civil institutions and that can easily be worked out by the Procurement and Assignment Service. The intern in the Navy is given a rotating service that will prepare him for active duty in the field. This war is a young man's war and we in the Navy are finding it necessary to put young doctors who are just out of school on our smaller ships, which are extremely active. It is necessary then for us to see that the young intern is given plenty of opportunity to do emergency surgery. He is also given intensive instruction in minor surgery and first aid. It is our practice to see that, in addition to the indoctrination these young men receive in naval customs and naval medicine, they are given special instruction in newer methods of naval hygiene, field sanitation and the diagnosis and treatment of tropical diseases. The fine spirit of cooperation that is being shown between the services and the medical educators of the country insures us in the matter of keeping the present teaching current with the advances that are being learned in actual warfare. In other words, the medical student will now get the latest information on the treatment of shock, the use of the sulfonamide drugs and the methods used in the treatment of burns and war injuries. The services will see to it that the information they get from the hard experience of treating casualties is put to use at once in the instruction of our young men.

Medicine has never been an easy subject to master, and any man who completes four years in medicine has achieved something. To the medical student today I should like to bring this thought: "Give serious attention to the study of pathology." It is a difficult subject and one of the most important with which we all have to deal. With a war on it will teach you, more than any other subject, methods to decrease our morbidity and mortality.

The medical student will be interested to know what the service offers to the graduate in medicine. What can he look forward to? I have said before that a medical officer in the Navy can do the best work of which he is capable, for he is given an opportunity to do just this. When he finishes his internship he will

be sent to sea on a combatant ship. Here he will undoubtedly see active service in the handling of war casualties. He has a responsibility, however, that goes well beyond the simple treatment of wounds. The medical officer on board ship occupies a singular position, for he has a definite mission and that is to keep our men well. It is no compliment to a doctor on a ship to have a large sick list. So to the young graduate in medicine again let me say that should you join the Navy you will find that your practice of medicine always approaches your problems from the preventive side. You must learn to plan to keep your crew well. This means you must know something about ventilation, you must know something about food inspection, you must realize that you will be the adviser to the commanding officer in all matters that pertain to keeping the crew well. There is no question that you must be a good doctor. That means you must be able to diagnose and treat disease as you find it. But we would expect you to do that. The medical officer of a ship must be a good, practical psychologist—that is, he must understand the psychology of the sailor.

It has been our practice in the past to keep the young medical officer who is entering the service on his first cruise at sea for a period of two years. During this time he finds out how we live in the Navy. He will meet many surprises, but he will be only too glad to enter into the spirit of life on board ship, for he will soon find that he plays a most important part in a huge machine. He will visit ports in many parts of the globe. He will face all kinds of new conditions in life. At the end of this tour, when we bring him ashore, we make it a point to send him to a hospital where he can again pick up the intense side of the practice of medicine. It is during this time ashore that we expect him to make up his mind as to the field of medicine in which he might care to specialize. Since we in the Navy have a specialty, which is naval medicine, we can never allow ourselves to specialize too highly in any of the other branches to the detriment of our real one. When a doctor shows promise in surgery, urology, x-ray or some of the other specialties, he is given an opportunity to go under instruction in one of our larger hospitals, where he has a tour of one year. At the end of that time if he has shown real promise he is ordered to a civil institution for further work in his specialty. As the years go on, each time he comes ashore a real attempt is made to see that his duty is such that his specialty can be put to use. We have found that this system works very well, and it does furnish an incentive for the young man to go on in the service.

The field of aviation is one that is extremely inviting to young medical officers. Here is a branch of the service that calls for an isolated specialty which we term "Aviation Medicine." Since flying is a young man's game, we are encouraging our younger medical officers to enter this field at the end of their first sea cruise. The course we offer in the training of young doctors for this special field is an excellent one and is made up of two parts—the didactic and the practical. On the didactic side, all of the newer methods are taught in the way of selecting and examining personnel. On the practical side, theories are put into practical application and in addition the doctor is taught to fly so that he may better understand the problems of the men with whom he must live.

In a more limited field we find the young officer entering the specialty that has to do with submarines and diving. While not so spectacular as aviation it is just as important. It is rather interesting to note at this point that the problems that face a pilot who flies in an altitude of 35 000 feet are not dissimilar to those of an officer who commands a submarine and submerges it to a depth of 250 feet.

To the officer who is interested in the scientific side of medicine we now have intensive courses in the field of epidemiology and trained teams are under instruction for duty in all parts of the world wherever the Navy or Marines may go. No matter what the disease may be whether it is malaria, yellow fever or plague, these men will be able to cope with conditions as they find them. It is no wonder the Navy emphasizes the great need for special preparation in premedical days, so that the graduate in medicine will have laid his groundwork and can easily qualify in these isolated specialties which are so necessary and so pressing at this time.

So to the young man entering the Navy let me briefly summarize the points which we should like to see him follow in his premedical course:

1 He should acquire a sound groundwork in science and mathematics.

2 He should place emphasis, while in medical school, on military medicine and tropical diseases. An extraordinary attempt should be made to get as much additional work in pathology as his school hours will permit.

3 He should adopt the attitude that his medical school is the instrument that provides him with all the necessary tools with which to practice medicine. He should make an early decision that he will not attempt to specialize until he has had a full opportunity to put into practice the fundamentals that he has been taught in school.

4 During intern days, he should keep abreast of all that is new in medicine, surgery and research that applies to these subjects.

5 To those who are responsible for the instruction of the intern should come the given responsibility that they are preparing this young man for immediate duty in the field where hundreds of lives may depend on their teaching.

One last word to the premedical student. You have a responsible job to do for your country as has the young man who is enlisting in the Army or in the Navy. Should you not then do your best to prepare yourselves for a commission in the services? If not, it would be better for you to enlist in one of the services now. However, medical education must go on—the Army, the Navy, the Public Health Service and the civil communities must have doctors throughout this war and after the war—so common sense among the medical educators is the most important single thing in the field of medical education today.

## UNITED STATES PUBLIC HEALTH SERVICE

Thomas Parran, M D

Surgeon General

The ancient phrase of the Hippocratic Oath "into whatsoever houses I enter" has taken on new and larger meaning today, for the "houses" which open their doors to the young physician are now as wide as the entire world. To his country a medical graduate's skill and knowledge are indispensable, to himself his training is the hub of many radiating lines of questioning about the future.

The answers which the medical graduate makes to these questions are largely determined by his understanding of what he is prepared to give his profession and what he wants to secure in return. The young physician reasonably expects certain fundamental satisfactions in his professional life. He wants to serve his nation, to begin productive work while he is still young and to earn a living. He wants to be assured of increasing experience and responsibility. He wants continuous and stimulating contacts with other professional men. And he seeks an opportunity for progress in some special field wherein his interests and abilities strongly lead him.

The United States Public Health Service is an organization in which the young physician may find these basic satisfactions. The Service is the principal agency of the government whose functions are primarily concerned with medicine and allied sciences. Its various activities are coordinated under the administration of doctors of medicine who are members of the commissioned medical corps of the Public Health Service.

The responsibilities of the Service demand the application of knowledge and skill in the three broad fields of clinical medicine, research and public health practice.

## CLINICAL MEDICINE

To become an able clinician is the one ambition of most medical students. The realization of that goal implies access to a wealth of clinical material, collaboration with competent, experienced practitioners, and the physical facilities requisite for the practice of modern medicine. These essentials are provided for the young service physician in thirty hospitals, one hundred and nineteen dispensaries and twenty-seven medical units in federal penal institutions.

The total bed capacity of the thirty service hospitals is over sixteen thousand, in which more than half a million patients are treated annually for diseases and conditions representing every specialty in medicine. In addition, physicians of the Service give medical and psychiatric care to some twenty thousand inmates of federal penal institutions and treat more than two thousand indigents in the Venereal Disease Medical Center, Hot Springs, Ark.

Twenty-six of the thirty service hospitals are operated by the Division of Marine Hospitals and Relief. In our hospitals the diagnostic and pathologic laboratories, the x-ray department, dental clinic, physical therapy department, the eye, ear, nose and throat clinics, the genitourinary and venereal disease clinics make available to the physician important contributory services necessary for thorough study and successful management of his cases. The general hospitals maintain outpatient departments.

The staff of a marine hospital is headed by an experienced medical officer whose duty it is not only to study the progress of patients but also to guide the progress

of the young physicians under his direction. As in the great university hospitals, the principle of group practice is applied in the hospitals of the Service. In frequent staff meetings, experiences are shared and individual problems discussed. Moreover, prompt access to a large consultant staff, drawn from the active medical profession of the community in which the hospital is located, affords continuous contact with experienced private practitioners.

The responsibility of rendering complete medical service to a large heterogeneous group of patients demands that the Public Health Service develop able practitioners of the highest skill and knowledge in the art and science of medicine.

#### SCIENTIFIC RESEARCH

The program of scientific research carried on by the National Institute of Health, a major administrative unit of the Service, is one of the most extensive of its kind in the world. Special divisions are devoted to toxicology, control, cancer, chemistry, chemotherapy, industrial hygiene, infectious diseases, pathology, public health methods and zoology.

Industry, public health and private medicine alike look to the National Institute of Health for the continuation of research necessary in the prevention of occupational diseases. Technologic changes in industry demand prompt and authoritative investigation of the effect of new substances and new processes on the human organism. New methods of prevention and control must be developed and applied. The importance of the industrial hygiene work of the Public Health Service has been greatly enhanced by the program of war production.

Although engineering and chemical control of industrial hazards is of first importance in the prevention of occupational disability, industrial health must be under the supervision of physicians. Thus a comparatively new specialty—industrial medicine—little known to medical students is opened to those who elect a career in the Service.

Testing, improving and demonstrating the effectiveness of public health methods are other essential investigatory functions of the Public Health Service. The collection and analysis of mass data on general and specific aspects of national health are carried on so that health problems of public importance may be accurately defined and related to their epidemiologic factors.

The Division of Pathology in the National Institute of Health, like the pathologic clinic in the medical school, has the last word on many of the investigations initiated in other divisions. In this unit the results of animal experimentation and of clinical research are subjected to the scrutiny of the pathologist and await his final diagnosis. The expanding research of the Service has increased the work of this division by leaps and bounds in recent years. It is here that junior officers receive training in pathologic diagnosis and description.

The foregoing summary of a few of the Institute's investigations and attainments can only serve to suggest the nature and extent of the manifold research activities of the Public Health Service.

#### PUBLIC HEALTH PRACTICE IN THE SERVICE

It would be misleading, however, to call the Service, as personified by its officers, a clinical or research agency alone. The Service is also adviser and helper of 1,824 official territorial, state and local health agencies.

When the President proclaimed a national emergency in 1940, federal and state health authorities were better prepared than ever before to cope with the many problems which arise from sudden concentrations of population in industrial and military mobilization areas. The pattern of technical and advisory aid at the request of state and local authorities, a long standing basic public health policy of the Service, had provided the nation with a corps of well experienced public health physicians, flexible and mobile enough to meet the demands of the emergency.

Today, the pattern of cooperative public health work, evolved by the Service and state authorities, forms the basis of an effective federal-state program for the expansion and constant strengthening of health services throughout the United States. The Public Health Service administers the allocation of federal funds made available annually to the states through the provisions of title VI of the Social Security Act. The Service also administers the federal-state program for the control of venereal diseases, made possible by the provisions of a special act of Congress in 1938.

The great task of making efficient full time health services available in all parts of the United States is only begun. More than ever, the need for trained public health physicians is paramount.

Foreign quarantine, always a major activity of the Service, has taken on new peaks of emphasis under the shifting pressures of war. It is significant that the United States Public Health Service was able to say in its last annual report to the Congress for the fiscal year 1941 that despite the war—always conducive to the spread of disease—not a single patient with quarantinable disease had entered the United States during the year.

In addition to the provision of medical and hospital service for the beneficiaries of the Public Health Service, the organization provides supervisory personnel and consultant service in the administration of medical care programs in other federal agencies. Such agencies include the Bureau of Indian Affairs, the Bureau of Prisons, the Farm Security Administration of the Department of Agriculture, the Pan American Sanitary Bureau and the Office of Civilian Defense, and numerous other war agencies and federal committees established to guide health defense activities.

In 1902, when Congress gave the Service the responsibility of standardizing and controlling the manufacture of biologic products, the death rate from diphtheria was 25.3 per hundred thousand. Today it approaches the vanishing point—mainly due to toxoid and antitoxin.

The solution of a number of medical problems seems simple today, yet when the medical student asks himself "What is the answer to arthritis, to heart disease, to cancer?" he will experience the same challenge as was offered by typhoid and diphtheria to students of an earlier day.

#### THE REGULAR COMMISSIONED MEDICAL CORPS

The Public Health Service is one of the "career" branches of the federal government and is organized to permit the recruitment of young officers and to guarantee the capable recruit permanent employment, in-service training, consistent promotion, disability benefits and retirement with pay without any cost to the officer.

The regular commissioned medical corps of the Service is organized along the same lines as are the medical corps of the Army and Navy. This medical corps now includes 439 officers on active duty, of whom

102 rank as Assistant Surgeon 186 as Passed Assistant Surgeon 54 as Surgeon 41 as Senior Surgeon, 46 as Medical Director 8 as Assistant Surgeon Generals, 1 as Assistant to the Surgeon General, 1 as Surgeon General. The great majority of these officers are on duty in the Hospital Division, the Divisions of States Relations Foreign Quarantine Venereal Disease, Mental Hygiene, the Public Health Service districts and the National Institute of Health.

The pay allowances and promotion schedule in the Army Navy and Public Health Service medical corps are the same. Commissions to the Public Health Service are granted by the President of the United States by and with the advice and consent of the Senate. The initial grade of commissioned medical officers in the Public Health Service is Assistant Surgeon. The successive higher grades are Passed Assistant Surgeon, Surgeon Senior Surgeon and Medical Director. These grades correspond to the grades ranging from First Lieutenant to Colonel in the Army Medical Corps.

Candidates for appointment in the initial grade of Assistant Surgeon must have the following qualifications. They must be citizens of the United States, they must be graduates of an approved medical school, they must have completed one year's internship in an approved hospital or its equivalent in experience, and their age at the time of examination must not be less than 23 nor more than 32 years.

Applicants for appointment to the commissioned corps of the Service are invited to appear before an examining board composed of commissioned officers of the Service. They must pass physical written and oral examinations given by the board.

Candidates who have passed the tests of the National Board of Medical Examiners are credited with the minimum passing grade for the written part of the professional examination. They must appear before the examining board of the Service for the physical, academic general fitness and oral examinations.

Examinations for appointment in the initial grade in the Public Health Service are held each year, usually in the early spring, and advance notice is published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.

#### THE RESERVE MEDICAL CORPS

The Public Health Service has authority by law to appoint for training, or in times of emergency, physicians who have completed their internships. Such appointments within the Reserve Corps are now being made. The rank to which a Reserve officer is appointed depends on his age and experience.

Three hundred and forty-nine Reserve officers are now on active duty, 184 of whom rank as Assistant Surgeon, 104 as Passed Assistant Surgeon, 40 as Surgeon, 20 as Senior Surgeon and 1 as Medical Director. The majority of Reserve officers are on duty with the Hospital Division, the Maritime Service and the Coast Guard in critical industrial and military mobilization areas. There is a distinct need for more personnel in these activities, which are closely coordinated with the war effort. Reserve officers receive the same rank, pay and allowances as Regular officers. Commissions are issued for five year periods, and there is a 5 per cent increase in pay every three years. The requirements for a commission in the Reserve are the same as for the Regular Corps, except that no written examination is required. Such appointments are recommended by the board of examiners on the basis of the applicant's qualifications and the report of his physical examination.

#### INTERNSHIPS

Although a Reserve commission in the Public Health Service does not insure deferment from induction into the Army or Navy, the Selective Service System is encouraging medical students to complete their training and internship before the question of recruitment and assignment arises. This year the Service has the opportunity to offer up to eighty internships. A person offered such an internship is also eligible for a reserve commission (inactive), provided, of course, he does not already hold such a commission in the Army or Navy.

First year interns are paid \$1,440 a year. After a deduction of \$630 for quarters and subsistence, provided by the government at the hospitals, where they must reside, this compensation amounts to \$67.50 a month.

Nine of the marine hospitals of the Public Health Service have been approved for intern training by the Council on Medical Education and Hospitals of the American Medical Association. First year internships are patterned on the standard system of rotating services.

Appointments to first year internships are announced annually on November 15. Applications from third and fourth year medical students will be given consideration when received. Students desiring further information regarding application for an internship should write the Surgeon General of the United States Public Health Service, Washington, D. C.

First year interns usually appear before the examining board of the Service to qualify for appointment in the commissioned corps just prior to the completion of their internship.

Candidates for a commission in the Regular Corps of the Public Health Service who pass the examination are placed on the Merit Roll in the order of their grades and receive appointments as Assistant Surgeons in that order.

Physicians who have passed the examinations and for whom no vacancy in the Regular Corps exists at the time may be commissioned in the Reserve Corps for active duty during the interim.

Officers in the initial grade of Assistant Surgeon after three years of service in the regular commissioned corps and after qualifying, under examination, are eligible for promotion to the grade of Passed Assistant Surgeon. Passed Assistant Surgeons are eligible for promotion to the grade of Surgeon after twelve years of service from the date of their commission as Assistant Surgeon. Promotion to the grade of Senior Surgeon is made after twenty years of service, and Medical Directors must have completed twenty-six years.

Physical examinations are given before promotion to each grade. Promotion to the grades of Passed Assistant Surgeon and Surgeon is preceded by written professional examinations before a board of commissioned officers. When Surgeons and Senior Surgeons become eligible for promotion to higher grades, such promotion is based on passing the physical examination and on a satisfactory record.

The United States Public Health Service calls for the physician with imagination, skill and determination. Wherever and whatever his activities may be, the public health physician's duties reach beyond the individual bedside to touch the lives of all the people. Into whatsoever houses he may enter, he is a direct representative of the more abundant life for which our nation is fighting.

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

HAROLD S. DIEHL, M.D.

Member, Directing Board, Minneapolis

The war is creating a greatly increased demand for young physicians. The only sources of supply of such physicians are the medical schools of the nation. All the male students of these schools now hold, or should hold, commissions in the medical corps of either the Army or the Navy. On completion of one year of internship those who qualify physically are subject to call to active duty. This means that for the duration of the war medical schools are essentially training institutions for medical officers. Obviously such institutions must continue to function to capacity and at maximum efficiency. To be able to do this they will require a continuing supply of qualified students, adequate support and competent and adequate teaching staffs.

Unless the age for military service is reduced it should be possible to accept for admission to medical school most of the desirable applicants before they are subject to induction by Selective Service. Quality rather than quantity of premedical work is of paramount importance. It is essential, however, that those students who have a real aptitude for the study of medicine be convinced that they can serve best by continuing their medical training. Premedical students who are of draft age may be removed from the jurisdiction of Selective Service by joining the recently authorized Enlisted Reserve Corps for college students of the Army or the V-1 or V-7 program of the Navy. On acceptance by an accredited medical school, such students may be discharged from their enlisted status to accept appointment as commissioned officers in the medical corps of the service to which they are obligated.

The financial problems of medical students occasioned by the accelerated program are being greatly eased by generous grants for loan funds which the Kellogg Foundation recently made to medical schools and by the recent appropriation by Congress making \$5,000,000 available through the United States Office of Education for loans to students in technical fields, including medicine. To be eligible for the latter loans students must be in the last two years of the medical course.

The effect of the accelerated program on medical school budgets is not yet entirely clear. In some schools increased income from tuition fees is sufficient to cover the increased cost of instruction. In others unless additional funds are provided the quality of instruction will inevitably suffer.

The most acute problem which medical schools are facing today is that of maintaining adequate and competent teaching staffs. On July 1 the Procurement and Assignment Service requested that the deans of medical schools prepare revised lists of their faculties with indications as to which individuals they consider available for military service and which are essential for the continuance of effective teaching programs in their schools. It was pointed out that in the preparation of these lists the deans have a dual responsibility: one to retain an adequate and efficient teaching staff, the other to release as many young men as possible for service with the armed forces. During the war emergency the teaching ordinarily done by the young men should be delegated so far as possible to those who because of age, sex or physical defects are not available for service with the armed forces. On the other hand, many of the most effective teachers in medical schools are well trained

young men who are making teaching their careers. It is fallacious to assume that such men can be satisfactorily replaced by busy practitioners who have had little or no experience as teachers. If the quality of medical training suffers, the results may not be immediately apparent, but they will be far reaching in the form of inferior medical service rendered by the thousands of physicians educated during the war. The quality of medical education dare not be sacrificed, and not only should those young men who are effective key teachers be declared "essential" but they should be advised that it is their patriotic duty to remain in their teaching positions. An analysis of the lists of "essential" teachers submitted by the deans is being made by the Procurement and Assignment Service, the results of which will be transmitted to the respective schools and to the appropriate committees of the Procurement and Assignment Service.

Internships are insisted on by the medical departments of both the Army and the Navy. During the war emergency both services, however, limit the length of the internship to one year for all interns who are under their jurisdiction. The directing board of the Procurement and Assignment Service recently enunciated a similar policy, stating that "physicians who have completed one year of internship shall be considered available for service unless they have been appointed to 'essential' positions."

Graduate training in the specialties of medicine is being greatly curtailed, because of the urgent needs of the armed forces for young physicians. In fact, the only grounds for deferment of military service for physicians to pursue graduate training is when such training is incidental to "essential" service as a hospital resident. In certain hospitals a resident staff is necessary for the adequate care of the patients. Recognizing this, the Procurement and Assignment Service has authorized the listing of certain residents as "essential." The period during which any individual may be so listed is not, after July 1, 1942, to exceed two years beyond the internship, the number of residents listed as "essential" is to be kept to a minimum, this minimum is not to exceed 50 per cent of the number of residents which the hospital has ordinarily had, and, as far as possible, essential residencies are to be filled with individuals who do not meet the requirements of the armed forces for commissions.

After March 1943, however, there may be serious difficulties in securing physicians to fill even "essential" hospital residencies. At that time all physically qualified male interns will be under the jurisdiction of the Army or the Navy and so cannot be appointed to residencies unless given deferment of call to active duty. Some "essential positions" can be satisfactorily filled by women or by men not physically qualified for military service. To fill others will require the deferment from active duty of a limited number of interns who are desired for appointment to essential residencies. Failing this there will be in certain hospitals a serious reduction in the quality not only of the care of the patients but also of the training of interns and medical students. The Procurement and Assignment Service has presented this problem to both the Surgeon General of the Army and the Surgeon General of the Navy, but as yet no satisfactory solution has been assured.

# FORTY-SECOND ANNUAL PRESENTATION OF EDUCATIONAL DATA BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

H. G. Weiskotten, M.D., Secretary

The Council presents, in this annual compilation of data pertaining to its educational activities, statements from authentic sources regarding medical education and war. Changes of major importance have occurred in the programs both of medical schools and of hospitals and an attempt has been made to present a concise and accurate account of current activities. In the following pages also is given the usual review of preliminary and undergraduate medical education, a description of the approved medical schools, comments on internships and residencies, the newly revised Essentials of an Approved Internship, and revised lists of approved internships and residencies and fellowships in the specialties. A summary of the activities of the various agencies interested in continuation courses for practicing physicians is here given. Finally are included the official requirements of each of the fifteen approved examining boards in medical specialties together with a statement of the policies adopted by these boards regarding allowances of credit for military service.

The Council and THE JOURNAL express thanks and appreciation to the military officials, the officers of the institutions mentioned, and others for their cordial cooperation in supplying the material submitted in this presentation and for other records furnished throughout the year to the office of the Council and the members of its staff on inspection or visitation, enabling the Council to maintain its medical student and hospital registers efficiently, to carry on its activities as outlined by the House of Delegates of the American Medical Association and to serve the profession.

The Educational Number of THE JOURNAL has proved to be of inestimable value to the medical profession and of particular interest to medical educators, hospital officials, students, interns, residents and those concerned with specialty certification and the promotion of graduate and postgraduate medical education. It is in frequent demand by governmental agencies. Reprints of the entire study, as well as an equal number of reprints of the lists of hospitals, are made available and are widely distributed.

## THE ACCELERATED PROGRAM

Medical schools of the United States have recognized that the national war emergency has created the need for a larger number of well qualified physicians. All but four medical schools have initiated an accelerated program to increase the supply of physicians for the Army, the Navy and the civilian population. The plan provides for the utilization of the long summer vacation as a teaching period, and, by continuing the schedule throughout the calendar year, the four year medical course is completed in three years. It should be possible for medical schools to maintain the quality and quantity of instruction which they have given in the past. The eligibility requirements for admission to medical schools have not been lowered from the present minimum standards set by the Association of American Medical Colleges and the Council on Medical Education and Hospitals of the American Medical Association.

Fifty-three schools have adopted the accelerated curriculum involving both the acceptance of entering students and the graduation of a class every nine months. Ten schools will graduate a class every nine months

during the next three years but will admit entering classes on an annual basis. The University of Tennessee College of Medicine will continue to operate on the four quarter plan, which provides for the admission of students at any quarter and the graduation of students quarterly. Eight schools of the basic medical sciences

September 1942 and the latter two in August 1942. In another school the entire four year curriculum is being offered for the first time, and a class will graduate in December 1943.

The details of the programs now in operation in the various medical schools are outlined in table 1. Similar data for the schools of the basic medical sciences are given in table 2. Listed also are the schools which plan to accept an entering class and graduate students every nine months, as well as those which, while graduating students every nine months during the next three years, will admit entering students once a year.

Licensure requirements in forty-one states, the District of Columbia, Alaska and Puerto Rico permit the granting of licenses, or have been so modified as to permit admission to licensure, to graduates who have completed the accelerated course of training in recognized medical schools. In seven states, Georgia, Illinois, Kansas, Michigan, Nebraska, New Jersey and South Carolina, existing statutory provisions require modification, probably by legislative action, before licenses can be granted to graduates who have completed the accelerated course of medical education.

Another difficulty will be that of correlating or integrating the graduation of medical students every nine months with the customary one year internship. As pointed out elsewhere in this issue of THE JOURNAL, certain hospitals are planning special programs.

#### SUPPLY OF PHYSICIANS

With the adoption of accelerated programs by most of the medical schools in this country, an attempt has been made to estimate the number of physicians who will be graduated from these schools during the next three years. These figures are shown in table 3 and are based on the student enrolment in each class and the particular program of each individual school.

Due allowance has been made for losses due to failures or discontinuance for other reasons. Losses are

estimated at 16.2 per cent for first year students, 5.1 per cent for second year students and 1 per cent for third year students. These percentages were based on the actual experience figures of all medical schools for the years 1937-1941 inclusive.

Included as "graduates" in this tabulation are those students who will have completed their formal undergraduate program in those schools requiring the internship before the granting of the M.D. degree.

Under normal conditions and without the adoption of the accelerated program, the number of physicians graduated during this same three year period would be approximately 15,947. If the estimates shown in this table are correct—and they are considered to be very conservative—21,029 students will actually be graduated during this period, or 5,082 more than would have graduated without the adoption of the accelerated programs. There are in addition approximately 220 students from the United States in the medical schools of Canada. With the adoption of the accelerated programs by these institutions it is anticipated that practically all of this group will also be graduated by June 30, 1945.

Never before in the history of this country have as many as 21,000 physicians been graduated from its medical colleges within a three year period.

In a previous issue of THE JOURNAL<sup>1</sup> it was estimated that the total number of deaths of physicians in the United States during 1941 was 3,460. It is difficult to determine what the over-all effect of the war will be on the annual deaths of physicians. However, the estimated number of graduates of the approved medical schools during the next three years, based on the annual deaths of physicians during recent years, provides more than two graduating physicians for every death.

TABLE 3—Estimated Number of Graduates of the Approved Medical Schools in the United States, July 1, 1942-June 30, 1945

| Dates of Graduation   | Estimated No. of Graduates |
|-----------------------|----------------------------|
| 1942                  |                            |
| July 1-December 31    | 275                        |
| 1943                  |                            |
| January 1-March 31    | 4,180                      |
| April 1-June 30       | 681                        |
| July 1-September 30   | 255                        |
| October 1-December 31 | 4,444                      |
| 1944                  |                            |
| January 1-March 31    | 399                        |
| April 1-June 30       | 541                        |
| July 1-September 30   | 4,578                      |
| October 1-December 31 | 380                        |
| 1945                  |                            |
| January 1-June 30     | 5,296                      |
| Total                 | 21,029                     |

It is comforting to realize that, rather than permit this war to interfere with the education of physicians, the federal authorities in cooperation with medical schools have adopted programs which will increase the output of physicians and at the same time retain the normal curriculum without any material lowering of standards.

Furthermore, the acute need of the Army is for young physicians for assignment to duty with troops. This need must be met, and there is here offered to recent graduates who have just completed internships

<sup>1</sup> Deaths of Physicians in 1941 editorial J. A. M. A. 119:565 (June 13) 1942

an unusual opportunity for service. Reports indicate that there are still many qualified graduates of 1941 who have not yet applied for commissions in the Medical Corps.

AFFILIATED ARMY HOSPITAL UNITS

One of the contributions of medical education to the war has been the organization of affiliated hospital units by the medical colleges of this country. The various medical colleges participating in this program are providing for the Army fully organized hospital staffs composed of unusually competent men in the various specialties, accustomed to working together and prepared to assume the medical responsibilities incident to the conduct of an army hospital.

As shown in table 4, forty medical schools have organized such hospital staffs. Of these, four schools have each organized two such staffs. These affiliated units are of three types, general hospitals, evacuation hospitals and surgical hospitals.

to this program at the present time and has announced its intention of continuing it. Medical students who hold commissions in the Medical Administrative Reserve Corps are urged to take this course if it is given in the colleges which they are attending. The schools which have such R O T C units are listed in table 5.

LOAN FUNDS AND SCHOLARSHIPS FOR STUDENTS IN ACCELERATED PROGRAMS

The accelerated program adopted by the medical schools has presented many new problems to the medical student. Prominent among these is the financial problem of the student with limited means. The long summer vacation period during which many students earned sufficient funds to permit them to continue their educational program has been eliminated.

As recently reported in THE JOURNAL, the W K Kellogg Foundation, recognizing the desperate situation facing these students, offered each of the medical schools an immediate grant of \$10,000 to be used as scholarships and loans at the discretion of the individual medical school. Grants of \$5,000 were made to the schools of the basic medical sciences which offer only the first two years of the medical course. Similarly grants were made by the W K Kellogg Foundation to certain schools of dentistry, public health and nursing.

It is planned that payments on loans from these funds will be made directly to the schools, thus providing for all time a revolving loan fund for deserving students.

This action by the W K Kellogg Foundation undoubtedly represents the largest single contribution that has ever been made in this country to enhance the opportunities for deserving but financially handicapped medical students to complete their medical education.

Sponsored chiefly by the American Council on Education, a program was recently initiated to secure federal funds in the form of loan funds which might be made available not alone to medical students but to certain other technical and professional students following an accelerated program. Congress voted favorably on the proposal, and \$5,000,000 has been made available for this purpose.

The regulations under which the law will operate were not available at the time this issue of THE JOURNAL went to press. The language of the law which was passed June 30, 1942 as provided by the U S Office of Education, is as follows:

PROVISION FOR LOANS TO STUDENTS IN CERTAIN ACCELERATED PROGRAMS

Language in the 1942-43 appropriation act for the Federal Security Agency, passed June 30, 1942

Loans to students in technical and professional fields (national defense). To assist students (in such numbers as the Chair of the War Manpower Commission shall determine) in the

In table 4 is shown opposite the name of the medical school the particular unit or units which it has assumed the responsibility for organizing.

R O T C UNITS IN MEDICAL SCHOOLS

For years the Army has believed that the Reserve Officers Training Corps program offered in medical schools provided a very desirable type of experience for medical students who might later be called to serve as officers in the medical corps of the army. The Surgeon General's Office is especially enthusiastic in regard

parting in accelerated programs in degree granting colleges and universities in engineering physics chemistry, medicine (including veterinary), dentistry and pharmacy, whose technical or professional education can be completed within two years, as follows:

**Loans.** For loans to students whose technical or professional education can be completed within two years to enable them to pursue college courses who attain and continue to maintain satisfactory standards of scholarship who are in need of assistance and who agree in writing to participate until otherwise directed by said Chairman in accelerated programs of study in any of the fields authorized hereunder and who agree in writing to engage, for the duration of the wars in which the United States is now engaged, in such employment or service as may be assigned by officers or agencies designated by said Chairman, such loans to be made by such colleges or universities or public or college-connected agencies from funds paid to them upon estimates submitted by them as to the amounts necessary therefor \$500,000. *Provided* That in case it shall be found that any payment to any such college university, or public or college-connected agency is in excess of the needs thereof for the purposes hereof, refund of such excess shall be made to the Treasurer of the United States and the amount thereof credited to this appropriation. Loans hereunder shall be made in amounts not exceeding tuition and fees plus \$25 per month and not exceeding a total of \$500 to any one student during any 12-month period said loans to be evidenced by notes executed by such students payable to the Treasurer of the United States at a rate interest at 2½ per cent per annum. Repayments of such loans shall be made through the colleges universities, or other agencies negotiating the loans and covered into the Treasury as miscellaneous receipts. *Provided* That indebtedness of students who before completing their courses, are ordered into military service during the present wars under the Selective Training and Service Act of 1940, as amended or who suffer total and permanent disability or death, shall be canceled. The foregoing loan program shall be administered in accordance with regulations promulgated by the Commissioner of Education with the approval of the Chairman of the War Manpower Commission.

#### DEVELOPMENTS IN MEDICAL EDUCATION

In the United States sixty-six approved four year medical schools and ten approved schools of the basic medical sciences carry the responsibility for the professional education of the physicians of this country. In times of war these heavy responsibilities are multiplied manyfold. The facilities of the medical schools have been taxed to the utmost by approximately a 10 per cent increase in the size of entering classes and by the institution of the accelerated programs. The loss of many faculty members through active service with the military forces and hospital units and the decrease in the resident personnel of the teaching hospitals have placed even further burdens on the permanent teaching staff.

No basic changes have been made in the established medical curriculum because of the accelerated programs now in operation, although courses have been surveyed and an attempt has been made to eliminate duplication of work and to insure better correlation of subject matter. Innovations have been introduced which are designed to increase the practical value of medical school programs.

Certain subjects peculiar to war have been added to the curriculum. Prominent among the subjects which are being given special attention are military medicine, first aid, tropical medicine, the study and treatment of war wounds and industrial medicine.

Much of the research being conducted in the various departments of the medical schools is directly related to the war effort and is of the utmost importance in

connection with the successful prosecution of the war. Such research is demanding an ever increasing amount of time and attention from already greatly depleted faculties.

The budgets of twelve schools have been materially increased. An aggregate annual increase of \$424,874 has been allotted to these schools ranging from \$1,090 to \$95,886. Eight of these schools have received increases in excess of \$22,000 and five over \$50,000.

Noteworthy improvements in preclinical departments have been made by six schools, providing more satisfactory facilities for both teaching and research.

Improvements affecting clinical teaching were reported by eight schools. These changes include closer affiliation with teaching hospitals increase in available teaching beds, a new clinic building and other noteworthy developments. Of special significance was the completion of the Western State Psychiatric Hospital, which is the mental teaching unit of the University of Pittsburgh School of Medicine. This hospital will provide about two hundred and fifty beds, which will be available for the instruction of students in psychiatry. The new neuropsychiatric institute at the University of Illinois College of Medicine was dedicated on June 6. Clinical facilities at Boston University School of Medicine were greatly improved as a result of the opening of the new Robert Dawson Evans Memorial building on May 12. This building contains nine floors and is equipped to house the Robert Dawson Evans Memorial for Clinical Research and Preventive Medicine.

The provision for these improvements, as well as many others not reported here, is commendatory in that they reflect continued effort on the part of medical educators of the country to progress in spite of the difficulties under which they are operating at the present time. Every effort is being made to maintain present standards in the training of physicians. The Council on Medical Education and Hospitals of the American Medical Association is gratified by the efforts being made and as always is anxious to be of any assistance possible in the further development of the medical schools.

#### CURRICULUM

The standard curriculum recognized by the Council on Medical Education and Hospitals and contained in its Essentials of an Acceptable Medical School consists of from three thousand six hundred to four thousand four hundred hours distributed as from nine hundred to one thousand hours per academic year and grouped under nine headings: anatomy, including histology and embryology, physiology, biochemistry, pathology, bacteriology and immunology, pharmacology, hygiene and sanitation, general medicine, general surgery, and obstetrics and gynecology. A certain percentage of the whole number of hours is devoted to each of these groups.

In the present emergency medical schools are conforming to these minimum requirements, although there may be slight deviation as a result of the institution of accelerated programs.

#### APPROVAL OF SCHOOLS IN CANADA

Following the survey of undergraduate medical schools<sup>2</sup> of the United States and Canada made during 1934-1936 by the Council on Medical Education and

<sup>2</sup> Weiskotten H. G. Schwittalla A. M. Cutter W. D. and Anderson H. H. Medical Education in the United States. Chicago: American Medical Association, 1940.

Hospitals, the secretary was instructed to inquire as to the policy to be adopted in the future regarding the faculties of medicine of Canada, that is, whether the American Medical Association should continue the approval of medical schools in Canada or whether they would prefer that the medical schools themselves or some other body take over this task. The problem was referred to the Canadian Medical Association, which at its annual meeting in June 1938 brought in a report which reads in part as follows:

In the event of the Council on Medical Education of the American Medical Association publishing a list of approved schools, those Canadian schools wishing their inspection and approval could request this inspection. This would leave each school free to deal directly with the Council on Medical Education of the American Medical Association and thus obviate misunderstandings. There seems to be a fairly uniform opinion expressed by the various medical schools in Canada that the Canadian Medical Association should share some responsibility in this country so far as medical education is concerned. The majority of the schools, however, feel that the aims and purposes of the Canadian Medical Association are not primarily those of undergraduate medical education, which is largely a problem of the schools themselves. However, it was recommended that if the Council on Medical Education and Hospitals of the American Medical Association in the future conduct similar surveys at five or ten year intervals, such as the recent survey, the Canadian schools take advantage of and be included in this survey. Those schools which are members of the Association of American Medical Colleges could have a representative from this association included in the personnel of the inspection. The remaining schools which are not members of the Association of American Medical Colleges could ask to have a member of the Association of American Medical Colleges included in the inspecting personnel or some representative from the Committee on Medical Education of the Canadian Medical Association.

It would appear from the foregoing that continued approval of the medical schools of Canada by the Council on Medical Education and Hospitals is a decision which rests with the schools themselves. By resolution, May 13, 1939, the Council voted to include the Canadian medical schools in the lists of approved schools maintained by it only at their request. The Council is willing as in the past to serve the medical schools of Canada.

#### PRELIMINARY EDUCATION

The Council on Medical Education and Hospitals in setting up its minimum subject requirements for admission to approved medical schools does not specify the number of hours required but rather refers to satisfactory courses in biology, physics and chemistry, including organic chemistry. Some of the medical schools still require a specific number of semester hours in these subjects. However, the general trend is to avoid rigidity and to deal with the subjects in terms of satisfactory courses. While the minimum requirement of collegiate credit advocated by the Council is two years of college training, which include English and theoretical and practical courses in physics, biology and general and organic chemistry, three years or more in college is recommended.

As a guide to medical schools in the selection of students and also to assist the prospective medical student in choosing a college for his premedical training, the Council publishes a compilation of approved colleges of arts and sciences. This list comprises colleges approved

by the following national and regional educational associations:

- Association of American Universities
- North Central Association of Colleges and Secondary Schools
- Middle States Association of Colleges and Secondary Schools
- New England Association of Colleges and Secondary Schools
- Southern Association of Colleges and Secondary Schools
- Northwest Association of Secondary and Higher Schools

Seven hundred and nineteen colleges are approved by these agencies, as follows:

|                                      |     |
|--------------------------------------|-----|
| Association of American Universities | 314 |
| North Central                        | 257 |
| Southern                             | 210 |
| Middle States                        | 128 |
| Northwest                            | 60  |
| New England                          | 45  |

All but nineteen of those approved by the Association of American Universities are also recognized by their district agency. This dual approval of two hundred and ninety-five institutions is thus apportioned:

|               |     |
|---------------|-----|
| North Central | 119 |
| Middle States | 69  |
| Southern      | 58  |
| New England   | 31  |
| Northwest     | 18  |

The five regional associations of colleges referred to cover among them the entire United States with the exception of the far Southwest.

Junior colleges are approved by these agencies but are omitted from the Council's compilation, because the Council itself recommends three years of college preliminary to entrance into medical school and because all but a negligible percentage of medical students have actually obtained three years or more in college.

In connection with the matter of acceptance by a medical school this list of approved colleges has been found useful, but the regulations of state departments of education and the rules of individual schools usually form a basis for accreditation of premedical work.

TABLE 6—Requirements for Admission to Medical Schools, 1936-1942

|           | Degree | Years |        |       |                  |     |
|-----------|--------|-------|--------|-------|------------------|-----|
|           |        | Four  | Three* | Three | Two and One Half | Two |
| 1936-1937 | 4      | 1     | 3      | 36    | 1                | 32  |
| 1937-1938 | 5      | 1     | 4      | 39    | 1                | 27  |
| 1938-1939 | 5      | 1     | 5      | 45    | 2                | 19  |
| 1939-1940 | 5      | 1     | 5      | 55    |                  | 11  |
| 1940-1941 | 6      | 1     | 5      | 56    |                  | 9   |
| 1941-1942 | 5      | 1     | 5      | 58    |                  | 8   |
| 1942-1943 | 4      | 1     | 4      | 60    |                  | 7   |

\* Baccalaureate degree conferred in absentia at end of first medical year

For the session 1942-1943, sixty-nine medical schools in the United States have preliminary requirements in excess of the minimum. Of these four required a degree, one required four years, four schools will admit students with three years of college work if the baccalaureate degree is conferred in absentia at the end of the first year in medicine, and sixty schools required three years of college work. Only seven schools have a stated two year requirement. These schools are the Universities of Arkansas, Howard, Louisville, Harvard, Buffalo, Pittsburgh and Tennessee.

see In table 6 are presented for six years figures indicating the trend toward increasing admission requirements. George Washington University School of Medicine increased its prerequisite for the present session to three years.

The general trend toward a premedical program involving three or more years of college work is evidence of an appreciation of the importance of liberalizing preprofessional educational programs. Aside from

TABLE 7—*Freshman Students Admitted with Less Than Three Years of College Preparation*

|           | Number of Schools With Two Year Requirement | Percentage of Freshman Enrolment |
|-----------|---|----------------------------------|
| 1936-1937 | 32  | 12.5                             |
| 1937-1938 | 27  | 7.4                              |
| 1938-1939 | 19  | 3.5                              |
| 1939-1940 | 11  | 2.0                              |
| 1940-1941 | 9   | 1.4                              |
| 1941-1942 | 8   | 1.2                              |

including satisfactory courses in the specific subjects which are fundamental to the initiation of the study of medicine, premedical education should offer students an opportunity to do advanced work in subjects in which they are especially interested. The field of medicine is today so broad that it offers unusual opportunities for students who have a special interest and advanced training in a wide variety of subjects.

Actually but 1.2 per cent (table 7) of the entire freshman class of 1941-1942 was admitted with less than three years of college work. Of the eight schools with a two year requirement for this session, three admitted none on this basis, one admitted four, another five, one

| One Year of College                      |                |                |
| California                               | Connecticut    |                |
| High School Graduation or Its Equivalent |                |                |
| Massachusetts                            | Nebraska       |                |

accepted fifteen, another seventeen, while one school accepted thirty-four such students, a total of seventy-five. Thus seventy-five students were enrolled in five schools with two years of college work, although in each case they represent less than 50 per cent of the freshman class. In 1936-1937, 12.5 per cent of the entering class had only the minimum of preliminary education, but by 1938-1939 the number dropped to 3.8 per cent and in 1941-1942 to 1.2 per cent.

Entrance requirements have been progressively raised, and it is to be hoped that no institution will find it necessary to lower its requirements during the present emergency.

The faculties of medicine in Canada vary in their premedical requirement. Two require a collegiate degree, two have a six year medical course preceded by senior matriculation which is equivalent to the work of the first year in a college of arts and five, including one school offering courses in the basic sciences, require two years, while one school requires three years before beginning a four year course.

A table appears later in this study which records the number of graduates of 1942 holding baccalaureate degrees (table 24).

With but four exceptions, namely California, Connecticut, Massachusetts and Nebraska, the state licensing boards exact the two year requirement. These states, however, with the exception of Massachusetts and Illinois, do not license other than graduates of approved schools, all of whom in the last decade, at least, have required two years or more of college training. Table 8 records the preliminary training required by each state medical licensing board, the District of Columbia, Alaska, Hawaii and Puerto Rico.

#### MEDICAL SCHOOLS AND SCHOOLS OF THE BASIC MEDICAL SCIENCES

Medical schools and schools of the basic medical sciences approved by the Council on Medical Education and Hospitals of the American Medical Association during the session 1941-1942 are listed in tables 9 and 10, pages 1270, 1271 and 1272. In addition to the name and location of the school there is recorded the number of years of college training required for admission by each school for the session 1942-1943, the enrolment by classes for the session just closed including figures indicating the number of fifth year students interning or engaged in research, the total attendance, and the number of graduates receiving the degree of Doctor of Medicine during the period July 1, 1941 to July 1, 1942. The name of the dean or acting dean of each school is also given. Figures for the sixth year enrolment in Canadian schools are given in a footnote. The fifth year (internship) enrolment is not included in the column giving the total number of students by classes.

Changes in the classification of medical schools that have taken place since the publication of the educational statistics in 1941,<sup>3</sup> as well as those whose approval was formerly on a probationary status and has not been changed, can be noted in footnotes at the bottom of these tables and refer to those schools which are marked by asterisks preceding the name. Five medical schools are in this category.

The University of Chicago School of Medicine and Rush Medical College do not report their students by classes, and in this tabulation only the total enrolment is given.

The University of California Medical School has discontinued the internship requirement affecting the class of 1942 and awarded degrees to fifty-five students who completed the course in 1941 and served internships during 1941-1942 and to fifty-six who completed four years of work in 1942, a total of 111.

Undergraduate courses in the clinical years which have been taught at Rush Medical College, Chicago, since 1837 terminated in 1942. During 1940-1941 arrangements were entered into by the trustees of Rush Medical College, the trustees of the University of Chicago, the trustees of the University of Illinois and the board of managers of the Presbyterian Hospital whereby

Statistics of Recognized Schools of the Basic Medical Sciences will be found in table 10 page 1272

\* On probation since Dec 1 1930  
 \* Approval withdrawn 1 61 15 1912 without prejudice to the students enrolled as of Sept 1 1912 thus providing protection for all graduates up to and including June 1915  
 \* On probation since June 6 1912  
 \* Enrollment not on above table by classes for the two medical schisms of the University of Chicago  
 \* 14th year (internship) enrollment not included in total column  
 \* Fifth year internship discontinued beginning with the class of 1912  
 \* Two year internship required after graduation  
 \* Sixth year enrollment Alberta 17 Queen's 40 Western Ontario 38 Toronto, 116

(Continued from page 1269)

the University of Chicago returned to the trustees of Rush Medical College the property and funds belonging to the college. The Rush property, buildings and equipment were leased to the Presbyterian Hospital to be maintained by them for the purpose of medical education and research. The Presbyterian Hospital entered into an affiliation with the University of Illinois providing for the teaching of undergraduate students of the University of Illinois in the wards of the Presbyterian Hospital, the Central Free Dispensary and the Rush buildings. The staff of the Presbyterian Hospital joins the faculty of the medical school of the University of Illinois. A newly constituted board of trustees of Rush Medical College will continue to conserve the funds and property of Rush Medical College. This board retains the Rush charter and name and ownership of the Rush buildings, equipment, library and certain funds and the power to appoint a faculty as needed. Under this plan, Rush Medical College is at liberty to use its name with

of Chicago and Rush Medical College enrolled 109 and 269 students respectively. Altogether, 24,884 students were studying medicine in the medical schools of the United States and Canada during the session 1941-1942. Of the medical students shown in these tabulations, 22,031 were pursuing medical courses in the United States. Of this number 6,218 were enrolled as freshmen, 5,406 as sophomores, 5,087 as juniors, 4,942 as seniors and 378 were students at the two Chicago schools that have been mentioned. Including fifth or intern year students, the total would be 22,798. The enrolment in the schools of the basic medical sciences numbered 639, of which 344 were freshmen and 295 sophomores. The enrolment in the Canadian medical schools included first year 696, second year 586, third year 553, fourth year 503, fifth year 276 and sixth year 239, a total of 2,853. In the one school of the basic medical sciences in Canada there were 48 students, 24 freshmen and 24 sophomores.

\* On probation since May 13, 1939

any postgraduate or graduate project or research for which funds may be provided. Thus the name of Rush Medical College will be perpetuated. For more than a century Rush Medical College has made outstanding contributions in the field of medical education. Its thousands of graduates have been and are a distinguished group. The data presented in tables 9 and 10 constitute the basis for several of the subsequent tabulations. Historical information regarding all institutions on the approved list of medical schools maintained by the Council on Medical Education and Hospitals will be found beginning on page 1283. In table 9 are listed sixty-seven medical schools in the United States and nine faculties of medicine in Canada, in table 10, ten approved schools of the basic medical sciences in the United States and one in Canada. The freshman enrolment in eighty-five medical schools of the United States and Canada for the session 1941-1942 was 6,914, the sophomore enrolment numbered 5,992, juniors 5,640, seniors 5,445, and fifth and sixth year students in Canadian schools 276 and 239 respectively. The school of medicine of the University

The degree of Doctor of Medicine during the period July 1, 1941 to July 1, 1942 has been awarded to 5,702 students, 5,163 received the degree from medical schools in the United States and 539 from Canadian faculties of medicine. No school of the basic medical sciences had an enrolment over 100. The lowest enrolment among the schools offering the complete course was 114 students at the Woman's Medical College of Pennsylvania and the highest 804 at the University of Toronto Faculty of Medicine. The highest among schools of the United States was 638 at the University of Illinois College of Medicine. Dartmouth Medical School, a school of the basic medical sciences, enrolled the fewest number of students, 40, representing 23 freshmen and 17 sophomores. The Woman's Medical College of Pennsylvania likewise graduated the lowest number of graduates, 18, and the University of Illinois granted the greatest number of degrees, 165. Fourteen schools granted degrees to classes of fewer than 50, thirty-nine graduated between 51 and 100 each, twelve between 101 and 150 and two

more than 151. In Canada one school graduated more than 100 students, while in three schools each there were between 51 and 100 graduates, and five had fewer than 50 graduates.

A cursory review of those now administering the affairs of medical schools reveals that within the last few years many changes have taken place. Only twenty-five of the seventy-six deans have been in their present administrative positions for twenty years or more. Of those sixteen have similarly served for fifteen or more years. The oldest dean in point of service is Dr. Robert Wilson, who has served as dean of the Medical College of the State of South Carolina since 1908. Four medical school deans are now with the armed forces, and their duties have been taken over by men serving in an acting capacity. Other deans are making notable contributions by devoting a considerable amount of time as members of committees responsible for various aspects of the war effort. The Council regrets the loss from the list of deans of such names as Dr. Paul S. McKibben of the University of Southern California and Dr. L. L. Dames of the University of Utah, who died during the past year, those of Dr. Percy Magrin of the College of Medical Evangelists and Dr. William S. Ladd of Cornell University, who relinquished their duties because of ill health, and Dr. Lee E. Sutton Jr. of the Medical College of Virginia, who will continue in a professorial position. The Council welcomes to the administrative field of medical education those who have been appointed to deanships in the last academic year and offers to them and to those serving as acting deans its wholehearted support and cooperation.

#### ENROLLMENT 1942-1943

With most of the schools already in session under the accelerated program, the figures presented in table 11 giving the enrollment of students at the present time and estimated figures for those who will begin the study of medicine in September 1942 will be of interest. With allowance for failures and discontinuance of their studies for other reasons, figures were presented earlier in this study (table 3) estimating the numbers of these students who will be graduated within the next three years. There are at the present time, or will be by October 1942, 22,674 students enrolled in the medical schools of the United States, representing 6,382 freshmen, 5,836 sophomores, 5,326 juniors and 5,130 seniors. The medical schools which are not operating under an accelerated program are the University of Arkansas, University of North Dakota and Howard and Baylor universities.

#### BIRTH PLACE OF STUDENTS

In table 12 the birthplace of medical students of the United States and Canada in attendance during 1941-1942 is shown by schools. The state furnishing the greatest number of students according to state of birth was New York with 2,711 students followed by Pennsylvania with 1,934, Illinois with 1,268 and Ohio with 1,127. Every state and the District of Columbia is represented in this table. It should not be inferred that every medical student enrolled in a state other than that of his birth is still a resident of his natal state. Still less should it be assumed that every one of these students has become a legal resident of the state in which his professional studies are assumed. According to state of birth, in addition to those mentioned, there was from each of four states a student enrollment of between 701

and 1,000, from three states 501 to 700, from seven states between 401 and 500 and between 301 and 400, from eight states 201 to 300, from eleven states between 101 and 200 and from five states less than 100 each.

There were 231 born in the United States territories and possessions studying in fifty-one schools in the

United States and 1 each studying in two schools in Canada. In addition, 2,577 of Canadian birth were also studying medicine. 135 of whom were matriculated in forty-four schools in the United States and 2,442 in ten Canadian medical schools. Twenty students of Canadian birth were registered at the College of Medical Evangelists and 15 at Wayne University College of Medicine. Other schools registered fewer than 8.

of Students

[illegible]

(Continued from page 1273)

Students born in New York were enrolled in all but eight schools and in every state with the exception of Iowa, Mississippi, Missouri, Nebraska, South Carolina, South Dakota, Utah and West Virginia. Students from New York were registered in three of the provinces of Canada having medical schools. None were studying in Alberta, Nova Scotia or Saskatchewan.

From the twelve states in which no medical schools are located there were 1,890 students studying in at least sixty-eight schools. There were 745 students born in New Jersey admitted to sixty-eight schools, while 303 from the state of Washington enrolled in fifty schools. Figures covering the number of students who listed as their birth state one which has no medical school together with the number of medical schools in which they enrolled, are reported as follows:

|              | Enrolled | No. of Schools |
|--------------|----------|----------------|
| Arizona      | 54       | 27             |
| Delaware     | 15       | 22             |
| Florida      | 174      | 35             |
| Idaho        | 101      | 30             |
| Maine        | 105      | 35             |
| Montana      | 117      | 44             |

|              | 1,890    |                |

Students of foreign birth were enrolled in sixty-five of the seventy-seven medical schools of the United States and in every Canadian school. There were 699 such students so enrolled, 512 in the United States and 187 in Canada. Thirty-one were so registered at the College of Medical Evangelists and a like number at New York University College of Medicine, 27 at the University of Illinois and 23 at Harvard Medical School. Other schools registered fewer than 20. It may be presumed that many of these students are now citizens of the United States.

The medical school enrollment is further classified by birth place in table 13. This compilation reveals that 13,904 students are studying in the state or province of their birth and 10,980 elsewhere. It will be noted that, in Illinois, of the 1,848 students enrolled in five schools, 969 were born outside the state. While more than 1,000 born outside the respective states were enrolled in institutions in New York and Pennsylvania, the number of those born within and studying in these states was greater. Schools located in California, Connecticut, the District of Columbia, Kentucky, Louisiana, Maryland, Massachusetts, Missouri, New Hampshire, North Carolina, Oregon and Tennessee enrolled more students from outside the state than from within.

In the United States 11,462 students were attending school in the state of their birth, and 10,569, 48 per cent, were studying elsewhere. Eliminating the 1,890 students from states which have no medical school, there are still 8,679 students who, though born in a state which had a medical school, are studying elsewhere.

While a perusal of table 13 will show many instances wherein the number studying elsewhere far exceeds the number attending school in the state of birth, it also shows many states in which the contrary is the case, namely Alabama, Arkansas, Colorado, Georgia, Indiana,

Iowa, Kansas, Michigan, Minnesota, Mississippi, New York, North Dakota, Ohio, Oklahoma, Pennsylvania, South Carolina, South Dakota, Texas, Utah, Vermont, Virginia, West Virginia and Wisconsin.

In Canada 411 of the 2,853 students were born outside the dominion.

The tables which next follow tabulate the student enrollment according to their status as residents or non-residents and show slightly different data.

RESIDENT AND NONRESIDENT STUDENTS

Table 14 gives for each medical school in the United States the number of resident and nonresident students according to the individual school's definition of the word "resident." There is a wide variation in the definition of this term among both state universities and other schools. In some universities this is determined by the legal or permanent residence of the student, parents or guardian only, while in some schools continuous residence for from six months to one, two or three years just prior to the student's application for enrollment is required. Other schools require the student to be a voter, that the parents' home in the state be established prior to the beginning of premedical work, that the student be a taxpayer or a dependent of a taxpayer regardless of whether he resides in the state, while other schools require the student to be self-supporting. In a few schools each case is determined by an attorney after consideration of birth, citizenship, residence of parents, and so on. Most commonly resi-

TABLE 13—Students Classified by Birth Place

|                      | Schools | Attending School In State of Birth | Birth Place Elsewhere |
|----------------------|---------|------------------------------------|-----------------------|
| Alabama              | 1       | 78                                 | 20                    |
| Arkansas             | 1       | 197                                | 95                    |
| California           | 4       | 330                                | 622                   |

dence is determined by ascertaining whether the student's parents or guardian has been a bona fide resident for a period of not less than six months. Among medical schools of other than state universities a resident is defined for the most part by the home address of the student or the legal residence of the parents or guardian.

Seventy-three schools, including seven schools of the basic medical sciences, reported 13,676 resident and 8,355 nonresident students. The state university enrolling the greatest number of nonresidents was the University of Tennessee College of Medicine, which had 236 resident and 234 nonresident students, while at the

TABLE 14—*Resident and Nonresident Students*

|   | Resident<br>Students | Non-<br>Resident<br>Students | Totals |

| Totals  | 13,676               | 8,355                        | 22,071 |

Long Island, New York Medical, New York University, Syracuse, Western Reserve, Jefferson and Baylor. The enrolment in the three municipally controlled medical schools included 91, 287 and 55 per cent nonresident students. The state supported medical schools as a group had enrolled 15.6 per cent nonresident students as compared with 51.9 per cent in other medical schools. Municipal universities as a group enrolled 33.6 per cent nonresident students and state and municipal institutions as a group enrolled 17.4 per cent.

Figures indicating enrolment of resident and nonresident students for six years beginning with the academic year 1936-1937, are shown in table 15. The figures do not vary to any measurable extent.

The ten faculties of medicine of Canada, including one offering courses in the basic medical sciences, reported 2,036 residents and 817 nonresident students. The definition of a resident in these schools varied from students whose permanent address is within one of the provinces of Canada or the specific province in which the school is located, to home address on registration and taxpayers. The greatest number of nonresidents in any one of the Canadian schools was reported by McGill University Faculty of Medicine, 251. This school has always obtained a large portion of its student body from the United States.

TABLE 15—*Resident and Nonresident Students, 1936-1941*

|           | Resident | Nonresident | Totals |
|-----------|----------|-------------|--------|
| 1936-1937 | 14,026   | 8,069       | 22,095 |
| 1937-1938 | 13,518   | 8,069       | 21,557 |
| 1938-1939 | 13,418   | 7,884       | 21,502 |
| 1939-1940 | 13,292   | 7,979       | 21,271 |
| 1940-1941 | 13,275   | 8,101       | 21,379 |
| 1941-1942 | 13,676   | 8,355       | 22,031 |

The figures in tables 14 and 15 giving the number of residents and nonresidents and the preceding two tables classifying students by birth place show a divergence. Excluding Canadian registration given in tables 12 and 13, there were 11,462 attending school in the state of their birth and 10,569 elsewhere, as compared with 13,676 whose legal residence is in the state in which they are pursuing their medical courses, and 8,355 classified as nonresidents. The figures for Canada show 2,442 born in Canada and 411 elsewhere, while there were 2,036 reported as residents and 817 as nonresidents.

## SCHOOLS, STUDENTS AND GRADUATES BY STATES

Medical schools and schools of the basic medical sciences are located in thirty-six states and the District of Columbia. The number of schools, students and graduates by states are shown in table 16. These figures include sixty-seven medical schools and ten schools of the basic medical sciences.

The greatest number of medical schools in any one state (nine) are located in New York. This state likewise had the greatest number of students (2,782) and graduates (634). Pennsylvania, with six schools, had 2,443 students and 598 graduates, Illinois, with five schools, 1,848 students and 564 graduates, ranks third, while Massachusetts with three schools, 1,152 students and 275 graduates and California with four schools, 1,012 students and 294 graduates complete the group of states having an enrolment of more than 1,000. The foregoing five states, in which are located 35 per cent

Universities of Georgia, Mississippi, Missouri and West Virginia nonresidents were not registered.

Among other than state universities, it will be noted that there are many schools which select most of their students from among the residents of the state. This is particularly significant at the Universities of Southern California, Stanford, Emory, Tufts, Boston, Albany,

of the medical schools in the United States, had 41.9 per cent of the students and 45.8 per cent of the graduates.

Seven of the aforementioned thirty-six states had no graduates, as the medical schools located therein do not offer the complete medical course. Twelve others had less than 100 graduates, the lowest being 31, who received their degrees from the one medical school in Vermont.

In the seventy-seven schools, including those that offer courses only in the basic medical sciences, there were 22,031 students and 5,163 graduates. Students interning as a requirement for the degree, fifth year students, are not included in this tabulation. There were 767 students serving internships as a prerequisite to obtaining the M.D. degree during 1941-1942. Likewise excluded from this tabulation are part time, special and graduate students pursuing courses in medical schools not leading to the M.D. degree.

The status of two medical schools has changed since the session 1941-1942. Undergraduate courses at Rush Medical College terminated in June 1942. For the session 1941-1942 only senior students were enrolled. On Aug. 4, 1939 the board of trustees of Wake Forest College accepted the resources of the Bowman Gray Foundation in Winston-Salem. The medical school of Wake Forest College was moved to Winston-Salem, N. C., in the summer of 1941 and is known as the Bowman Gray School of Medicine of Wake Forest College. The school, which has offered courses only in the basic medical sciences, is planning to offer the complete medical

TABLE 16—Schools, Students and Graduates by States \*

\* Excluding fifth or intern year students

course, and instruction to juniors has been offered since July under the accelerated program. It is expected to offer senior instruction beginning in March 1943 and to have its first graduating class in December of that year.

REQUIRED INTERNSHIPS

The medical schools and licensing boards requiring a hospital internship for the M.D. degree and state licensure, respectively, are shown in tables 17 and 18. Nine schools in the United States and four in Canada require an internship for graduation. Several medi-

| University of Montreal Faculty of Medicine           |

cal schools will accept research or other clinical work in lieu of hospital service. The University of Minnesota Medical School in 1915 was the first school to adopt the internship as a basis for the M.D. degree. Since 1940 the requirement has been dropped by six schools in the United States and one in Canada. The last school to withdraw the requirement was the University of California Medical School. This school in 1942 awarded degrees to 55 students who completed their course in 1941 and served internships during 1941-1942 and to 56 who completed four years of college work in 1942, a total of 111. In 1942 the University of Alberta Faculty of Medicine added the internship to its requirement for the degree, but this requirement has not been added in recent years by any medical school in the United States.

Twenty-two states, the District of Columbia, Alaska, Hawaii and Puerto Rico require that all applicants for

TABLE 18—Internship Required by Medical Licensing Boards of All Candidates

Some states require the internship of graduates of medical faculties abroad and reciprocity or endorsement applicants.

licensure shall have served a hospital internship. The first state exacting this requirement was Pennsylvania in 1914. In addition, other states require the internship of graduates of faculties of medicine abroad and of reciprocity or endorsement applicants.

A few of the medical schools and licensing boards have their own list of hospitals acceptable for intern training, but the list of approved internships compiled by the Council on Medical Education and Hospitals is generally in use. A revised edition of the Council's list will be found beginning on page 1311.

There were 767 students in the United States and 145 in Canada, a total of 912, reported as completing the fifth or intern year requirement of the medical schools which exact the fulfillment of the internship as a requisite for the M.D. degree.

## DISTRIBUTION BY SEX

Students and graduates in the United States and Canada classified according to sex are shown in table 19. Sixty-eight medical schools in the United States had both men and women students of which fifty-seven

TABLE 19—Distribution by Sex

|  | Students |       | Graduates |       |
|--|----------|-------|-----------|-------|
|  | Men      | Women | Men       | Women |
| University of Alabama                        | —        | 2     | —         | 1     |
| University of Arkansas                       | —        | 9     | 100       | 11    |
| University of California                     | 250      | 13    | 72        | 5     |

| Totals                                       | 23 551   | 1 333 | 5 397     | 305   |

medicine of Canada had both men and women students, and six had women graduates during the session just closed.

Male students in the United States numbered 20,867 and included 4,884 graduates, female students numbered 1,164 and graduates 279. There were enrolled in Canadian schools 2,684 men and 169 women. Of these 513 were men graduates and 26 women.

There were 2,162 students enrolled in medical schools in the United States which are not coeducational, and of this number 488 graduated during the last session.

TABLE 20—Distribution by Sex in the United States and Canada, 1936-1941

| Year      | Students |        | Graduates |        |
|-----------|----------|--------|-----------|--------|
|           | Male     | Female | Male      | Female |
| 1936-1937 | 21 219   | 1 254  | 5 385     | 265    |
| 1937-1938 | 23 757   | 1 244  | 5 624     | 261    |
| 1938-1939 | 22 234   | 1 307  | 5 479     | 252    |
| 1939-1940 | 22 010   | 1 293  | 5 390     | 255    |
| 1940-1941 | 22 402   | 1 291  | 5 420     | 273    |
| 1941-1942 | 22 453   | 1 308  | 5 527     | 310    |
|           | 2 351    | 1 323  | 5 397     | 305    |

In the one school in Canada which does not admit women there were 226 students and 41 graduates.

In the one medical school for women in the United States there were 114 students and 18 graduates during 1941-1942.

The greatest number of women enrolled in coeducational institutions in the United States was 41 studying at the University of Illinois College of Medicine. In Canada, 64 were enrolled in the University of Toronto Faculty of Medicine.

Figures are given in table 20 showing this distribution for a seven year period. For the session 1941-1942 there has been a slight increase in the number of both men and women students.

## WOMEN IN MEDICINE

Elizabeth Blackwell was the first woman to receive the degree of Doctor of Medicine in the United States. She studied in and graduated at the Geneva Medical

TABLE 21—Women in Medicine in the United States

| Year | Women Students | Percentage of All Students | Women Graduates | Percentage of All Graduates |
|------|----------------|----------------------------|-----------------|-----------------------------|
|      |                |                            |                 |                             |
| 1905 | 1 073          | 4.1                        | 219             | 4.0                         |
| 1910 | 907            | 4.0                        | 116             | 2.6                         |
| 1915 | 392            | 4.0                        | 92              | 2.6                         |
| 1920 | 515            | 5.8                        | 122             | 4.0                         |
| 1925 | 910            | 5.0                        | 204             | 5.1                         |
| 1926 | 935            | 5.0                        | 212             | 5.4                         |
| 1927 | 964            | 4.9                        | 189             | 4.7                         |
| 1928 | 959            | 4.5                        | 207             | 4.9                         |
| 1929 | 925            | 4.4                        | 214             | 4.8                         |

College, now the Syracuse University College of Medicine, in 1849. The first medical school for women, the Woman's Medical College of Pennsylvania, was organized in 1850 with a class of 7 students. It is still functioning and is the only medical school in the United States which teaches women students exclusively. All but six of the seventy-seven medical schools in the

had women graduates. Women were enrolled in seven of the ten schools in the United States offering only courses of the basic medical sciences. Nine faculties of

United States admit women students. These six schools are Georgetown University School of Medicine, Emory University School of Medicine, Harvard Medical School, St. Louis University School of Medicine, Dartmouth Medical School and Jefferson Medical College. Two schools which have been coeducational since their organization had no women students in 1941-1942, namely the Universities of North and South Dakota. The Hahnemann Medical College of Pennsylvania accepted women students for the first time in 1941-1942 and admitted 10.

During the past year, as shown in table 21, there were 1,164 women studying medicine constituting 5.3 per cent of the total student enrollment. The enrollment of women in 1941-1942 was an increase of 18 over the previous session. There were 279 women graduates, or 5.4 per cent of the total number of graduates. Eighteen were graduates of the Woman's Medical College of Pennsylvania, while 261 secured their degrees from coeducational schools. Of the women students 114 were in attendance at the one medical school for women while 1,050 were students in sixty-eight other schools. In the eighteen years since 1925, 4,080 women have received degrees in medicine. It has recently been estimated that there are about 7,500 women physicians in the United States.

PART TIME, SPECIAL AND GRADUATE STUDENTS ENROLLED IN MEDICAL SCHOOLS

The various courses of the undergraduate medical curriculum are today so closely integrated that medical educators have recognized that it is only under unusual conditions that a student should be permitted to undertake the study of medicine on a part time basis.

Special and graduate students fall into a different category, and their acceptance as such depends on school policies and local conditions such as the relationships of the medical school to other departments of a university.

In addition to the regularly enrolled undergraduate medical students there were 1,035 part time, special and graduate students pursuing medical subjects during 1941-1942 in forty-four medical schools in the United States and four in Canada. This group comprised 132 part time, 416 special and 487 graduate students and is summarized in table 22.

Students on a part time basis (132) were enrolled in twenty schools in the United States. The largest group studying in any one school (34) were in the University of Texas Medical Branch. Fewer than 5 were enrolled in each of twelve schools.

The 416 special students matriculated in twenty-eight schools in the United States and two in Canada. The greatest number (168) were in attendance at the University of North Carolina School of Medicine. The majority of these students were undoubtedly enrolled in the School of Public Health of the University of North Carolina, which maintains close cooperation with the School of Medicine. Ninety-nine were enrolled in Northwestern University School of Medicine and 41 in the School of Medicine of the University of Chicago. Other schools registered fewer than 17.

There were also 487 students not candidates for the medical degree pursuing medical subjects in eighteen medical schools of the United States and three in Canada. This group has been reported as graduate students and is probably enrolled in the graduate school of the university. At Northwestern University Medical

School there were 116 such students and at the University of North Carolina School of Medicine 57, while other schools matriculated fewer than 50.

The Universities of Kansas, Johns Hopkins, Michigan and North Carolina matriculated all three of these types of students.

SCHOOLS, STUDENTS AND GRADUATES, 1905-1942

The number of medical schools, students and graduates in the United States for five year intervals from 1905 to 1920 and for each year since is shown in table 23. This tabulation covers only candidates for the M.D. degree and does not include part time and special students, though their work may later be accepted as

fulfilling part of the requirement for the M.D. degree, in which cases they are reported as regularly enrolled students and are thereafter included in these computations.

In 1905 in the one hundred and sixty medical schools existing there were 26,147 students. The total number of undergraduate medical students for the college session 1941-1942 in seventy-seven approved medical schools was 22,031. In the ten years from 1910 to 1920 there was a decrease in enrollment of more than 7,000, owing to the enforcement of educational standards and the closure of many proprietary schools, while from 1921 to 1935 there was a continuous increase in students among approved colleges. For four years the trend was slightly downward and then in 1940 there was again an increase. The decrease in student enrol-

ment in 1936 and thereafter was in part the result of the survey of medical schools conducted by the Council on Medical Education and Hospitals during 1934-1936<sup>2</sup> and its recommendation to several medical schools that their enrolment be decreased in order to provide more adequate opportunities for the student body. However, the executive council of the Association of American Medical Colleges at a meeting held May 30, 1941 recommended that those schools which could do so without lowering standards of medical education increase the enrolment of the 1941 entering class by 10 per cent in order to help meet the medical needs of the national emergency. Thus the number of students enrolled during 1941-1942 was 22,031, an increase of 652 over the previous year.

Again referring to table 23 it will be noted that the total number of graduates in 1942 was 5,163, a decrease of 112 over 1941. The discontinuance of the internship requirement by two schools in 1941 was responsible for the high figure of that year as compared with previous years. There were however fewer graduates in 1942 from sixty-seven medical schools granting the M.D. degree than from the one hundred and sixty schools

TABLE 23—Schools, Students and Graduates in the United States 1905-1942

|      | Schools | Students | Graduates |
|------|---------|----------|-----------|
| 1905 | 169     | 20,147   | 609       |
| 1910 | 131     | 21,576   | 4,440     |
| 1915 | 96      | 14,891   | 3,557     |
| 1920 | 83      | 13,798   | 3,047     |
| 1921 | 81      | 14,466   | 3,186     |
| 1922 | 81      | 13,615   | 2,520     |
| 1923 | 80      | 16,969   | 3,120     |
| 1924 | 79      | 17,728   | 3,662     |
| 1925 | 80      | 18,900   | 3,974     |
| 1926 | 79      | 18,840   | 3,962     |
| 1927 | 80      | 19,662   | 4,080     |
| 1928 | 80      | 20,340   | 4,262     |
| 1929 | 79      | 20,878   | 4,446     |
| 1930 | 76      | 21,397   | 4,560     |
| 1931 | 76      | 21,982   | 4,730     |
| 1932 | 76      | 22,135   | 4,936     |
| 1933 | 77      | 22,468   | 4,890     |
| 1934 | 77      | 22,799   | 5,035     |
| 1935 | 77      | 22,888   | 5,101     |
| 1936 | 77      | 22,364   | 5,183     |
| 1937 | 77      | 22,020   | 5,377     |
| 1938 | 77      | 21,587   | 5,194     |
| 1939 | 77      | 21,302   | 5,080     |
| 1940 | 77      | 21,271   | 5,097     |
| 1941 | 77      | 21,379   | 5,270     |
| 1942 | 77      | 22,031   | 5,163     |

\* Includes figures for schools of the basic medical sciences.

existing in 1905. With a few exceptions there has been an increase in the number of medical graduates each year since 1925. The lowest number of M.D. degrees was granted in 1922. In that year there were 2,520 graduates because of the small size of the class that entered as freshmen in 1918 during the World War.

The number of medical schools in 1905 was one hundred and sixty, by 1910 the number dropped to one hundred and thirty-one, and since 1915 there have been fewer than one hundred. Since 1933 there have been in the United States sixty-six approved four year schools, one offering only clinical courses and ten schools of the basic medical sciences. The school offering only clinical courses terminated undergraduate study with the class of 1942, and one school which formerly offered courses in the basic medical sciences is developing a full four year course.

In the seventy-seven medical schools in the United States including the schools of the basic medical sciences, there were during the last session 22,031 students and 5,163 graduates.

#### GRADUATES WITH BACCALAUREATE DEGREES

While only six schools require a degree for admission, figures contained in table 24 indicate that 4,166 of the 5,702 graduates of medical schools of the United

TABLE 24—Graduates with Baccalaureate Degrees

States and Canada held baccalaureate degrees. This is exclusive of those holding the degree B.S. in medicine. The latter group is separately dealt with in the next section. In the United States alone, 3,907 of the 5,163 medical graduates were in possession of baccalaureate

<sup>2</sup> Weiskotten H. G., Schwittalla A. M., Cutter W. D. and Anderson H. H. Medical Education in the United States. Chicago: American Medical Association, 1940.

degrees All the graduates of Stanford, Johns Hopkins, Tufts, Albany, Cornell, New York Medical, Syracuse, Western Reserve, University of Oregon, Jefferson and Laval University—eleven schools—held baccalaureate degrees Four of these schools require the degree for admission, while two others will enroll students with three years of college training if the baccalaureate degree is conferred at the end of the first year in medicine, and five have a stated three year requirement Three schools having a degree requirement of three years and a degree at the end of the first year of medicine graduated altogether 15 students with less than the stated college education

None of the graduates of the University of Alberta held degrees in arts on graduation The school in the United States having the fewest graduates with college degrees was the Woman's Medical College of Pennsylvania, 15, but this school had only 18 graduates However, Loyola University School of Medicine, with a graduating class of 67, reported that only 19 of this class also held arts college degrees At the University of Toronto Faculty of Medicine, 24 of a class of 116 held such degrees

A percentage of 73 of all graduates in the United States and Canada in 1942 held baccalaureate degrees

GRADUATES WITH BS IN MEDICINE DEGREE

Certain graduates of thirty medical schools in the United States and one in Canada, in 1942, received the Bachelor of Science degree in Medicine There were 483 awarded in the United States and 27 in Canada, a total of 510 The largest single group to receive the degree were 88 graduates of the University of Minnesota, the University of Illinois granted 78, the University of Oklahoma 42, Rush Medical College 40, Indiana University 37, Northwestern University 29, the University of Alberta 27 and Creighton University 23 Other schools issued fewer than 20

Schools in general are discontinuing the practice of issuing such degrees, while others have never done so

STUDENTS BY CLASSES, 1930-1941

The number of students enrolled in preclinical and clinical classes in the medical schools of the United States for each session from 1930 to 1940 is presented in table 25 For the session 1941-1942 the attendance

TABLE 25—Students in the United States by Years, Including the Intern Year When Required for Graduation, 1930-1941

|           | Preclinical |        | Clinical |        | Intern | Total  |
|-----------|-------------|--------|----------|--------|--------|--------|
|           |             |        |          |        | Year   |        |
| 1930-1931 | 6,456       | 5,538  | 5,080    | 4,908  | 1,025  | 23,007 |
| 1931-1932 | 6,260       | 5,402  | 4,932    | 4,885  | 1,067  | 23,202 |
| 1932-1933 | 6,426       | 5,479  | 5,017    | 4,948  | 1,106  | 23,572 |
| 1933-1934 | 6,457       | 5,571  | 4,988    | 4,937  | 1,183  | 23,982 |
| 1934-1935 | 6,350       | 5,624  | 5,142    | 4,905  | 1,233  | 24,121 |
| 1935-1936 | 6,005       | 5,458  | 5,230    | 5,020  | 1,213  | 23,777 |
| 1936-1937 | 5,910       | 5,269  | 5,140    | 5,158  | 1,255  | 23,350 |
| 1937-1938 | 5,791       | 5,225  | 4,986    | 5,036  | 1,132  | 22,719 |
| 1938-1939 | 5,754       | 5,160  | 4,947    | 4,921  | 1,152  | 22,454 |
| 1939-1940 | 5,794       | 5,177  | 4,921    | 4,894  | 1,152  | 22,423 |
| 1940-1941 | 5,837       | 5,254  | 4,969    | 4,849  | 1,058  | 22,437 |
| 1941-1942 | 6,218*      | 5,406* | 5,087*   | 4,942* | 767    | 22,798 |

\* Excluding enrolment figures for Rush Medical College 109 and The School of Medicine of the University of Chicago 269, a total of 378

for the first preclinical year was 6,218 In the second preclinical year 5,406 were registered In the clinical years 5,087 and 4,942 respectively were enrolled The University of Chicago School of Medicine and Rush

Medical College do not report their students by classes, and therefore the figures for enrolment at these schools are included only in the total column During the session just closed there were 269 students enrolled in the University of Chicago School of Medicine and 109 at Rush Medical College, a total of 378 students

By comparison with the previous session, it will be noted that the freshman class was increased by 381, the sophomore enrolment 152, the junior class 118 and the senior class 93 The number entering as a requirement for the degree decreased 291, owing to the discontinuance of this requirement by several schools in recent years There was an increase in the total enrolment of 361 This is the largest student body since the session 1937-1938

FEES

The eighty-seven medical schools of the United States and Canada, including those offering courses in the basic medical sciences, have been arranged in six groups in

TABLE 26—Fees, 1941-1942

|              | Schools |
|--------------|---------|
| Under \$99   | 2       |
| \$100 to 199 | 7       |
| 200 to 299   | 21      |
| 300 to 399   | 14      |
| 400 to 499   | 17      |
| 500 or over  | 26      |
| Total        | 87      |

Based on fees charged resident students

table 26 according to the tuition fees charged resident students for the session 1941-1942 The data are based on the average tuition fee charged for the complete medical course and include minor charges such as for matriculation, breakage, diploma and graduation

Two medical schools the Universities of Oklahoma and Texas, charged fees under \$99 a year Twenty-six schools, eighteen of which are located in the eastern section of the country, had fees of \$500 or more, namely College of Medical Evangelists, Yale, George Washington, Georgetown, Loyola, Rush, Tulane, Johns Hopkins, University of Maryland, Tufts, St. Louis, Washington, Albany, Columbia, Cornell, Long Island, New York Medical, New York University, Syracuse, Buffalo, Rochester, Cincinnati, Western Reserve, Hahnemann, University of Pennsylvania and Pittsburgh

Medical school fees have been increased, as can be noted by a comparison with earlier figures In 1941 there were three schools in the first group, eight in the second, twenty in the third, fifteen in the fourth, nineteen in the fifth and twenty-two in the last group

Thirty-two schools in the United States and five in Canada made an additional charge for nonresidents, ranging from \$50 each year by the Universities of Nebraska, Cincinnati and Virginia to \$400 exacted by Louisiana State University School of Medicine One school in Canada has a nonresident fee of \$5 for the first and \$10 for the second, third and fourth years Thirteen schools have a nonresident fee of \$100 or less, fourteen have fees between \$101 and \$200, seven from \$201 to \$300, and two from \$301 to \$400, while one school has a reciprocal fee for nonresidents

The average resident fee charged by medical schools in the United States for the session 1941-1942 was \$395, whereas in 1941 it was \$386 and in 1940, \$378

## DESCRIPTION OF MEDICAL SCHOOLS

### ARKANSAS

#### Little Rock

UNIVERSITY OF ARKANSAS SCHOOL OF MEDICINE 1203 McAlmont Street—Organized in 1877 as the Medical Department of Arkansas Industrial University. Present title in 1922. In 1911 the College of Physicians and Surgeons united with it and it became an integral part of the University of Arkansas. The first class was graduated in 1880. Clinical teaching was suspended in 1918 but resumed in 1923. Coeducational since organization. The faculty consists of 26 professors and 113 lecturers and instructors a total of 139. The curriculum covers four years of nine months each in medicine. Entrance requirements are two years of collegiate work. The B.S. Degree is conferred at the end of the second year. The fees for the four years for residents of Arkansas are \$250 per year non-residents are charged \$225 additional each year. The registration for 1941-1942 was 242 graduates 16. The next session begins September 30 1942 and ends June 15 1943. The Dean is Byron L. Robinson M.D.

### CALIFORNIA

#### Berkeley-San Francisco

UNIVERSITY OF CALIFORNIA MEDICAL SCHOOL University Campus Berkeley Medical Center San Francisco—Organized in 1864 as the Toand Medical College. The first class graduated in 1864. In 1873 it became the Medical Department of the University of California. In 1909 by legislative enactment the College of Medicine of the University of Southern California at Los Angeles became a clinical department but was changed to a graduate school in 1914. In 1915 the Hahnemann Medical College of the Pacific was merged and elective chairs in homeopathic materia medica and therapeutics were provided. Coeducational since organization. Three years of collegiate work are required for admission. The work of the first year is given at Berkeley and that of the last three years at San Francisco. An accelerated program has been adopted consisting of three terms of sixteen weeks in each academic year. The medical course may now be completed in two and two third years. The faculty is composed of 168 professors and 311 associates and assistants a total of 479. The fees average \$300 per academic year non-residents are charged \$300 additional each year. The registration for 1941-1942 was 253 graduates 111. The present session began June 15 1942 and will end February 6 1943. The subsequent session begins February 15 1943. The Dean is Francis S. Smyth M.D. San Francisco

#### Loma Linda-Los Angeles

COLLEGE OF MEDICAL EVANGELISTS Loma Linda Boyle and Michigan Avenues Los Angeles—Organized in 1909. The first class graduated in 1914. The laboratory departments are at Loma Linda the clinical departments at Los Angeles. Coeducational since organization. Three years of collegiate work are required for admission. The faculty is composed of 45 professors and 367 associates assistants and instructors a total of 412. The course covers a period of four years of nine months each and an additional year consisting of an internship in an approved hospital. During the present military emergency vacations have been diminished to a minimum with a resulting accelerated course. The total fees are respectively \$612 \$601 \$612 and \$612. The registration for 1941-1942 was 309 graduates 77. The present session began July 5 1942 and will end April 4 1943. The subsequent session begins April 4 1943. The President is Walter E. Macpherson M.D. Los Angeles. The Dean is E. H. Risley M.D. Loma Linda. The Assistant Dean is W. F. Norwood Ph.D. Los Angeles.

#### Los Angeles

UNIVERSITY OF SOUTHERN CALIFORNIA SCHOOL OF MEDICINE 3551 University Avenue—Organized in 1895 as the University of Southern California College of Medicine. First class graduated in 1888. In 1908 it became the Los Angeles Medical Department of the University of California. In 1909 the College of Physicians and Surgeons established in 1904, became the Medical Department of the University of Southern California. Its activities were suspended in 1920, reorganized in May 1928 under present title. During present national emergency will operate the year round on accelerated three term basis each term continuing for sixteen weeks. Matriculation of new classes will be mid June of each year during emergency. The faculty consists of 165 professors and 236 instructors assistants and others a total of 401. An internship is required for graduation. Three years of collegiate work are required for admission. Coeducational since organization. Annual fees amount to \$452. The registration for 1941-1942 was 208 graduates 49. The present session began June 15 1942 and will end January 29 1943. The Dean is Seeley G. Mudd M.D.

#### Stanford University-San Francisco

STANFORD UNIVERSITY SCHOOL OF MEDICINE University Campus Stanford University 2398 Sacramento Street San Francisco. The main buildings are in San Francisco. The laboratories of anatomy bacteriology and experimental pathology chemistry and physiology are located on the campus at Stanford University which is thirty miles southeast of San Francisco adjoining the City of Palo Alto. The post office is Stanford University. Organized in 1908 when by agreement the interests of Cooper Medical College were taken over. The first class graduated in 1913. Coeducational since organization. The faculty

consists of 136 professors and 183 lecturers assistants and others a total of 319. Three years of collegiate work are required for admission. The quarter plan is in operation admitting one class each year. An internship is a requirement for graduation. The fees for the four years respectively are \$474 \$438 \$418 and \$418. The registration for 1941-1942 was 242 graduates 57. During 1942-1943 the quarters begin June 15, September 29, March 29 and June 17 and will end August 29, December 18, March 19 and June 9. The Dean is Loren Hoscoe Chandler M.D.

### COLORADO

#### Denver

UNIVERSITY OF COLORADO SCHOOL OF MEDICINE 4200 East Ninth Avenue—Organized in 1883. Classes were graduated in 1885 and in all subsequent years except 1898 and 1899. Denver and Gross College of Medicine was merged Jan. 1 1911. Coeducational since organization. The faculty is composed of 57 professors and 130 lecturers instructors and assistants a total of 187. The accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The entrance requirements are three years of collegiate work. The fees average \$289 per academic year. Non-residents are charged \$245 additional each year. The registration for 1941-1942 was 217 graduates 51. The present session began June 15 1942 and will end March 19 1943. The subsequent session will begin March 29 1943. The Dean is Maurice H. Rees M.D.

### CONNECTICUT

#### New Haven

YALE UNIVERSITY SCHOOL OF MEDICINE 333 Cedar Street—Chartered in 1810 as the Medical Institution of Yale College. Organized in 1812 instruction began in 1813 first class graduated in 1814. A new charter in 1879 changed the name to the Medical Department of Yale College. In 1884 the Connecticut Medical Society surrendered such authority as had been granted by the first charter. In 1887 Yale College became Yale University. Coeducational since 1916. The faculty consists of 185 professors and 241 lecturers and assistants a total of 426. The requirements for admission are three years of collegiate work. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. The fees average \$506 per academic year. The registration for 1941-1942 was 206 graduates 51. The present session began June 29 1942 and will end March 20 1943. The subsequent session will begin April 5 1943. The Dean is Francis G. Blake M.D.

### DISTRICT OF COLUMBIA

#### Washington

GEORGETOWN UNIVERSITY SCHOOL OF MEDICINE 3900 Reservoir Road N.W.—Organized in 1851. First class graduated in 1852. The faculty is composed of 62 professors 46 associate professors 11 assistant professors 21 adjunct professors and 147 instructors a total of 287. Three years of work in an acceptable college of arts and sciences is required for admission. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. The fees average \$500 per academic year. The registration for 1941-1942 was 299 graduates 85. The present session began June 29 1942 and will end March 6 1943. The subsequent session begins March 15 1943. The Dean is David V. McCauley S.J., Ph.D.

GEORGE WASHINGTON UNIVERSITY SCHOOL OF MEDICINE 1335 H Street N.W.—Organized in 1825 as the Medical Department of Columbian College. Also authorized to use the name National Medical College. Classes were graduated in 1826 and in all subsequent years except in 1834 to 1838 and 1861 to 1863 inclusive. The original title was changed to Medical Department of Columbian University in 1873. In 1903 it absorbed the National University Medical Department. In 1904 by an Act of Congress the title of George Washington University was granted to the institution. Coeducational since 1884. The faculty is composed of 81 professors and 150 instructors demonstrators and assistants a total of 231. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. The fees average \$550 per academic year. The registration for 1941-1942 was 285 graduates 72. The present session began June 8 1942 and will end February 2 1943. The subsequent session will begin March 1 1943. The Dean is Walter A. Bloedorn M.D.

HOWARD UNIVERSITY COLLEGE OF MEDICINE Fifth and W Streets N.W.—Chartered in 1867. Organized in 1869. The first class graduated in 1871. Coeducational since organization. Negro students compose a majority of those in attendance. The faculty comprises 41 professors and 61 instructors and assistants a total of 102. The admission requirements are at least two years of collegiate work. The course covers four years of thirty three weeks each. The fees are respectively \$269 \$269 \$259 and \$266. Registration for 1941-1942 was 186 graduates 35. The next session begins Sept. 26 1942, and ends June 4 1943. The Dean is John Wesley Lawlah M.D.

## GEORGIA

## Atlanta

EMORY UNIVERSITY SCHOOL OF MEDICINE, 50 Armstrong Street—Organized in 1854 as the Atlanta Medical College. Classes graduated 1855 to 1861, when it suspended. Reorganized in 1865. A class graduated in 1865 and each subsequent year except 1874. In 1898 it merged with the Southern Medical College (organized in 1878), taking the name of Atlanta College of Physicians and Surgeons. In 1913 it merged with the Atlanta School of Medicine (organized in 1905), resuming the name of Atlanta Medical College. Became the Medical Department of Emory University in 1915, assumed present title in 1917. Three years of collegiate work are required for admission. The course of study is four academic years of thirty-two weeks each. By the use of the long summer vacation as a traveling quarter, the time required for the completion of these four academic years has been reduced from four to three calendar years. This is in line with the accelerated program adopted by most medical schools during the present emergency. The fees for each of the four academic years are \$357. The registration for 1940-1941 was 218, graduates, 45. Classes this year began on June 15, 1942 and will end March 15, 1943. The subsequent session will begin March 23, 1943. The Dean is Russ H. Oppenheimer, M.D.

## Augusta

UNIVERSITY OF GEORGIA SCHOOL OF MEDICINE, University Place—Organized in 1828 as the Medical Academy of Georgia, the name being changed to the Medical College of Georgia in 1829. After 1873 it was known as the Medical Department of the University of Georgia. On July 1, 1933, the name was changed to the University of Georgia School of Medicine. Property transferred to the University in 1911. Classes were graduated in 1833 and all subsequent years except 1862 and 1863. Coeducation was begun in 1920. The faculty includes 71 professors and 30 assistants, a total of 101. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$225 per academic year for residents of Georgia, nonresidents are not admitted. The registration for 1941-1942 was 212, graduates, 42. The present session began July 1, 1942, and will end March 22, 1943. The subsequent session will begin April 7, 1943. The Dean is G. Lombard Kelly, M.D.

## ILLINOIS

## Chicago

LOYOLA UNIVERSITY SCHOOL OF MEDICINE, 706 South Wolcott Avenue—Organized in 1915 by requisition of Bennett Medical College which had been organized in 1869. Facilities enlarged upon by requisition of Chicago College of Medicine and Surgery, faculties in basic medical sciences put on full time basis and present title assumed in 1917. Operated as an organic part of Loyola University. Coeducational since organization. Ninety semester hours is the minimum requirement for admission. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. An internship is a requirement for graduation. The faculty is composed of 38 full time professors and 260 associate and assistant professors, associates, instructors and assistants, a total of 298. The fees average \$515 per academic year. The registration for 1941-1942 was 275, graduates, 67. The present session for all classes began on July 6, 1942 and will end April 10, 1943. The subsequent session will begin April 19, 1943. The Dean is Francis J. Braceland, M.D.

NORTHWESTERN UNIVERSITY MEDICAL SCHOOL, 303 East Chicago Avenue—Organized in 1859 as the Medical Department of Lind University. First class graduated in 1860. In 1864 it became independent as the Chicago Medical College. It united with Northwestern University in 1869 but retained the name of Chicago Medical College until 1891, when the present title was taken. Became an integral part of Northwestern University in 1905. Coeducational since 1926. The faculty comprises 29 professors, 149 associate and assistant professors and 413 associates, instructors and clinical assistants, a total of 591. The requirement for admission is three years of collegiate work. The B.S. in medicine degree may be conferred before the end of the sophomore year. An accelerated program has been adopted involving the acceptance of a class every nine months. A hospital internship is required for graduation. The total fees are \$414 each year. The registration for 1941-1942 was 557, graduates, 159. The present session began June 17, 1942 and will end March 24, 1943. The subsequent session will begin March 29, 1943. The Dean is J. Roscoe Miller, M.D.

UNIVERSITY OF CHICAGO, THE SCHOOL OF MEDICINE, Fifty Eighth Street and Ellis Avenue—Organized in 1924, as a part of the Ogden Graduate School of Science of the University of Chicago. In 1932, when the University of Chicago reorganized its departments, the medical departments were included in the Biological Sciences Division. The work of the first two years in the medical courses has been given on the University Quadrangles since 1899, but the last two years were offered only at Rush Medical College which was affiliated with the university until 1927 when actual work in the clinical departments on the campus began. After that time, candidates for the degree of Doctor of Medicine could take the work of the first two years on the campus and the work of the third and fourth years either on the campus or at the Rush Medical College. In June 1940 Rush Medical College became affiliated with the University of Illinois College of Medicine. All undergraduate instruction is now given only on the campus of the University of Chicago. The faculty of the School of Medicine is composed of 103 professors, 198 associates, instructors and others, a total of 301. The requirements for admission are three years of collegiate work. The B.S. degree may be obtained during the second year. The curriculum covers twelve quarters of work. Sixty-five students are admitted to the first year class every nine months. The tuition fee averages \$450. The

registration for 1941-1942 was 269, graduates, 65. During the academic year 1942-1943 the quarters begin June 22, September 29, January 4, and March 29, and will end September 12, December 19, March 27, and June 18. All correspondence relating to general policies should be addressed to W. H. Taliaferro, Ph.D., Dean of the Division of Biological Sciences, or to A. C. Brehmeyer, M.D., Associate Dean, and that pertaining to student affairs to Victor Johnson, M.D., Dean of Medical Students.

UNIVERSITY OF ILLINOIS COLLEGE OF MEDICINE, 1853 West Polk Street—Organized in 1882 as the College of Physicians and Surgeons. The first class graduated in 1883. It became the Medical Department of the University of Illinois by affiliation in 1897. Relationship with the university was cancelled in June 1912, and was restored in March 1913 when the present title was assumed. Coeducational since 1898. Three years of collegiate work are required for admission. The accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The B.S. in medicine degree is conferred at the end of the second year. The faculty is composed of 165 professors and 394 associates, instructors and assistants, a total of 559. The fees for residents of Illinois average \$288 per academic year, nonresidents, \$524. The registration for 1941-1942 was 638, graduates, 165. The present session for juniors and seniors began June 15, 1942 and will end March 29, 1943. Freshmen and sophomores will enroll Sept. 28, 1942 and will complete the year June 5, 1943. The Dean is David J. Davis, M.D.

## INDIANA

## Bloomington-Indianapolis

INDIANA UNIVERSITY SCHOOL OF MEDICINE, Bloomington, 1040 West Michigan Street, Indianapolis—Organized in 1903 but did not give all the work of the first two years of the medical course until 1905. In 1907, by union with the State College of Physicians and Surgeons, the complete course in medicine was offered. In 1908 the Indiana Medical College, which was formed in 1905 by the merger of the Medical College of Indiana (organized in 1878), the Central College of Physicians and Surgeons (organized in 1879), and the Fort Wayne College of Medicine (organized in 1879) merged into it. The first class was graduated in 1908. Coeducational since organization. The faculty consists of 270 professors, lecturers, associates and assistants. Three years of collegiate work are required for admission. The B.S. degree in medicine is conferred. The school has been on an all-time program since May 11, 1942. Each school year is divided into three terms. The work given in two terms is equivalent to the work formerly given in a year. The work of the first two terms is given at Bloomington, the remainder of the work at Indianapolis. Regular fee for two terms of work is \$217 for residents of Indiana and \$422 for nonresidents. The registration for 1941-1942 was 507, graduates, 108. The next regular class will start work on January 7, 1943. The Dean is Willis D. Gatch, M.D., Indianapolis.

## IOWA

## Iowa City

STATE UNIVERSITY OF IOWA COLLEGE OF MEDICINE, University Campus—Organized in 1869. First session began in 1870. First class graduated in 1871. Absorbed Drake University College of Medicine in 1913. Coeducational since 1870. The faculty is made up of 56 professors, 74 lecturers, demonstrators and assistants, a total of 130. Three years of collegiate work are required for admission. The B.A. degree in the combined course of liberal arts and medicine is conferred. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The tuition fee is \$226 each year for residents of Iowa and \$490 for nonresidents. The registration for 1941-1942 was 282, graduates, 46. The present session for upper classmen began May 11, 1942 and for freshmen June 8, 1942 and will end February 20, 1943. The subsequent session begins February 22, 1943. The Dean is Ewen Murchison MacEwen, M.D.

## KANSAS

## Lawrence-Kansas City

UNIVERSITY OF KANSAS SCHOOL OF MEDICINE, Lawrence, 39th Street and Rainbow Boulevard, Kansas City—Organized in 1880. It offered only the first two years of the medical course until 1905, when it merged with the Kansas City (Mo.) Medical College, founded in 1869, the College of Physicians and Surgeons, founded in 1894, and the Medical-Chirurgical College, founded in 1897. Absorbed Kansas Medical College in 1913. The first class graduated in 1906. The clinical courses are given at Kansas City. Coeducational since 1880. The faculty includes 70 professors and 176 instructors, assistants and others, a total of 246. The requirement for admission is three years of collegiate work. The B.S. degree in medicine is conferred at the end of the second year. An accelerated program has been adopted admitting a freshman class in June of each year. Seniors will graduate approximately every nine months. The fees for residents of the state average \$238, nonresidents \$437. The registration for 1941-1942 was 335, graduates, 81. The present session for freshmen began June 1, 1942. Upper classmen will enroll Sept. 21, 1942 and complete the year May 31, 1943. The Dean is H. R. Wahl, M.D., Kansas City.

## KENTUCKY

## Louisville

UNIVERSITY OF LOUISVILLE SCHOOL OF MEDICINE, 101 West Chestnut Street—Organized in 1837 as Louisville Medical Institute. The first class graduated in 1838 and a class graduated each subsequent year except 1863. In 1846 the name was changed to University of Louisville.

**Medical Department.** In 1902 it absorbed the Kentucky University Medical Department in 1908 the Louisville Medical College the Hospital College of Medicine and the Kentucky School of Medicine. In 1922 it changed its name to the University of Louisville School of Medicine. Coeducational since organization. Two years of collegiate work are the minimum requirement for admission. Preference is given applicants with a degree or three college years leading to a degree. The faculty numbers 92 professors and 145 assistants, instructors and others, a total of 237. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. Fees average \$450 per academic year. The registration for 1941-1942 was 60 graduates 84. The present session began July 1 1942 and will end Feb 28 1943. The subsequent session will begin April 1 1943. The Dean is John Walker Moore MD.

## LOUISIANA

### New Orleans

**LOUISIANA STATE UNIVERSITY SCHOOL OF MEDICINE** 1542 Tulane Avenue—Organized January 1911 as Louisiana State University Medical Center. Present title in 1919. Coeducational. First session October 1931 with students of first and third year. Faculty comprises 29 professors and 139 assistant professors, assistant professors, instructors and assistants, a total of 168. Course covers four sessions of no less than 32 weeks each. Under the accelerated program adopted for the duration of the war, a first year class will be admitted each nine months and the entire course will be completed within a period of three years. A minimum of three years' collegiate work is required for admission. Total fees \$134 each year for residents of Louisiana, additional tuition of \$60 each year for nonresident. The registration for 1941-1942 was 342 graduates 85. The present session began June 25 1942 and will end March 6 1943. The subsequent session will begin March 11 1943. The Dean is B. I. Burns MD.

**TULANE UNIVERSITY OF LOUISIANA SCHOOL OF MEDICINE** 1430 Tulane Avenue—Organized in 1834 as the Medical College of Louisiana. Classes were graduated in 1835 and in all subsequent years except 1863-1866 inclusive. It became the Medical Department of the University of Louisiana in 1847 and in turn the Medical Department of the Tulane University of Louisiana in 1884. Present title in 1913. Coeducational since 1913. The faculty comprises 31 professors and 220 associate and assistant professors, instructors and assistants, a total of 251. An accelerated program has been adopted involving the admittance of a class annually and the graduation of a class approximately every nine months. A minimum of three years of collegiate work is required for admission. Total fees average \$547 per academic year. The registration for 1941-1942 was 496 graduates 121. The next session begins Sept 1 1942 and ends April 17 1943. The Acting Dean is Hiram W. Host mayer MD.

## MARYLAND

### Baltimore

**JOHNS HOPKINS UNIVERSITY SCHOOL OF MEDICINE** 710 North Washington Street—The nucleus of a Medical Faculty was constituted in 1883. Systematic postgraduate instruction in pathology and bacteriology was begun in 1886. School was fully organized and opened in 1893. The first class graduated in 1897. Coeducational since organization. The faculty consists of 70 professors and 421 instructors, assistants and others, a total of 491. The requirement for admission is a collegiate degree. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. The fees average \$627 per academic year. The registration for 1941-1942 was 290 graduates 75. The present session for upper classes began June 1 1942 and will end Feb 27 1943. Freshmen enrolled June 29 1942 and will complete the year Feb 27 1943. The subsequent class will begin March 1 1943. The Dean is Alan M. Cheney MD.

**UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE AND COLLEGE OF PHYSICIANS AND SURGEONS** Lombard and Greene Streets—Organized in 1807 as the College of Medicine of Maryland. The first class graduated in 1810. In 1812 it became the University of Maryland School of Medicine. Baltimore Medical College was merged with it in 1913. In 1915 the College of Physicians and Surgeons of Baltimore was merged and the present name assumed. Coeducational since 1918. The faculty consists of 37 professors and 302 associate and assistant professors and others, a total of 339. Three years of collegiate work are required for admission. The accelerated program has been adopted involving the admittance of a freshman and the graduation of a class approximately every nine months. The fees average \$301 for residents of the state, nonresidents \$130 additional. The registration for 1941-1942 was 373 graduates 85. The present session began June 25 and will end March 27 1943. The subsequent session will begin April 8 1943. The Acting Dean is H. Boyd White MD.

## MASSACHUSETTS

### Boston

**BOSTON UNIVERSITY SCHOOL OF MEDICINE** 80 East Concord Street—Organized in 1873 as a homeopathic institution. In 1874 the New England Female Medical College founded in 1848 was merged into it. The first class was graduated in 1874. Became nonsectarian in 1918. Coeducational since organization. Three years of collegiate work are required for admission. The faculty includes 23 professors, 188 associates and others, a total of 211. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Total fees average \$480 per academic year. The registration for 1941-1942 was 217 graduates 52. The present session

began June 30 1942 and will end Feb 13 1943 for 1st and 2d year students, February 20 1943 for 3d year students and February 27 1943 for 4th year students. The subsequent session begins March 31 1943. The Dean is Bennett F. Avery MD.

**HARVARD MEDICAL SCHOOL** 25 Shattuck Street—Organized in 1782. The first class graduated in 1788. It has a faculty of 189 members and 479 other instructors and assistants, a total of 668. Two years of collegiate work are required for admission. The accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$420 plus \$5 the first year for matriculation. The registration for 1941-1942 was 533 graduates 129. The present session began July 1 1942 and will end February 27 1943. The subsequent session begins March 8 1943. The Dean is C. Sidney Burwell MD.

**TUFTS COLLEGE MEDICAL SCHOOL** 416 Huntington Avenue—Organized in 1893 as the Medical Department of Tufts College. The first class graduated in 1894. Coeducational since 1894. It has a faculty of 96 professors and 311 assistant lecturers and others, a total of 407. A bachelor's degree is required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$308 per academic year. The registration for 1941-1942 was 482 graduates 94. The present session began July 1 1942 and will end March 1 1943. The subsequent class will begin about April 1 1943. The Acting Dean is Dwight O'Hara MD.

## MICHIGAN

### Ann Arbor

**UNIVERSITY OF MICHIGAN MEDICAL SCHOOL**—Organized in 1850 as the University of Michigan Department of Medicine and Surgery. The first class graduated in 1851. Present title assumed in 1915. Coeducational since 1870. It has a faculty of 29 professors, 19 associate professors, 27 assistant professors, 118 assistants, instructors and lecturers, a total of 193. The entrance requirements are ninety semester hours. An accelerated program has been adopted involving the admittance of a class annually and the graduation of a class every nine months. The fees average \$250 per academic year for nonresidents \$400 a year. The registration for 1941-1942 was 456 graduates 105. The present session for upper classes began June 15 1942 and will end February 6 1943. Freshmen will enroll October 3 1942. The Dean is A. C. Furst cnberg MD.

### Detroit

**WAYNE UNIVERSITY COLLEGE OF MEDICINE** 1516 St. Antoine Street—Organized as the Detroit College of Medicine in 1885 by consolidation of the Detroit Medical College organized in 1868 and the Michigan College of Medicine organized in 1879. Reorganized with the title of Detroit College of Medicine and Surgery in 1913. The first class graduated in 1869. In 1918 it became a municipal institution under the control of the Detroit Board of Education. In 1934 the name was changed by action of the Detroit Board of Education to Wayne University College of Medicine as a part of the program of consolidation of the Detroit city colleges into a university system. Coeducational since 1917. Entrance requirement is an academic degree or 90 semester hours of academic credit with combined degree guaranteed by school of arts and sciences. The faculty consists of 45 professors, 287 lecturers and others, a total of 332. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. An internship is a requirement for graduation. The fees average \$325 for Wayne County residents and for nonresidents \$425. The registration for 1941-1942 was 233 graduates 54. The present session began June 29 1942 and will end March 20 1943. The subsequent session will begin April 5 1943. The Dean is Edgar H. Norris MD.

## MINNESOTA

### Minneapolis

**UNIVERSITY OF MINNESOTA MEDICAL SCHOOL**—Organized in 1883 as the University of Minnesota College of Medicine and Surgery reorganized in 1888 by absorption of St. Paul Medical College and Minnesota Hospital College. The first class graduated in 1889. In 1908 the Minneapolis College of Physicians and Surgeons organized in 1883 was merged. In 1909 the Homeopathic College of Medicine and Surgery was merged. Present title in 1913. Coeducational since organization. The faculty includes 204 professors of whom 77 are on full time appointment and 127 on part time and 134 instructors, 29 of whom are on full time appointment and 105 on part time, a total of 338. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. The entrance requirements are three years of university work which must include six semester credits of rhetoric, eight semester credits of physics, thirteen credits of general chemistry, qualitative and quantitative analysis, organic and physical chemistry, eight credits of general zoology and genetics and eugenics, four credits of general psychology and a reading knowledge of scientific German with a C average in all subjects and in the sciences. Students are required to meet the requirements for a degree of BS or BA before receiving the degree of Bachelor of Medicine (MB) which is granted at the end of the course. The MD degree is conferred after a year of intern work of advanced laboratory work or of public health work has been completed. Total fees are \$236 per academic year for residents and \$412 for nonresidents. The registration for 1941-1942 was 477 graduates 117. The academic year 1942-1943 began June 17 and will end March 18 1943. The subsequent class will begin March 1943. The Dean is Harold S. Diehl MD.

## MISSOURI

## St. Louis

ST. LOUIS UNIVERSITY SCHOOL OF MEDICINE 1402 South Grand Boulevard—Organized in 1901 as the Marion Sims Beumont Medical College by union of Marion Sims Medical College organized in 1890, and Beumont Hospital Medical College organized in 1886. First class graduated in 1902. It became the Medical School of St. Louis University in 1903. The faculty is composed of 81 professors and 251 instructors and assistants, a total of 332. The completion of three years of college study is the minimum admission requirement but students presenting meritorious credits in excess of the minimum are accepted by preference. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$536 per academic year. The registration for 1941-1942 was 443, graduates 94. The present session began June 15, 1942, and will end February 20, 1943. The subsequent session begins March 1, 1943. The Dean is Alphonse M. Schwabha, S. J., Ph. D.

WASHINGTON UNIVERSITY SCHOOL OF MEDICINE Kingshighway and Euclid Avenue—Organized in 1842 as the Medical Department of St. Louis University. The first class graduated in 1843. In 1855 it was chartered as an independent institution under the name of St. Louis Medical College. In 1891 it became the Medical Department of Washington University. In 1929 it absorbed the Missouri Medical College. Coeducational since 1919. The faculty comprises 135 professors and 265 lecturers, instructors and others, a total of 403. Four years of collegiate work are required for admission. The B. S. degree in medicine is conferred at the end of the third or fourth year. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$520. The registration for 1941-1942 was 359, graduates 93. The present session for upper classmen began June 15, 1942 and for freshmen July 13, 1942 and will end March 20, 1943. The subsequent session begins March 22, 1943. The Dean is Philip A. Shaffer, Ph. D.

## NEBRASKA

## Omaha

CREIGHTON UNIVERSITY SCHOOL OF MEDICINE 306 North Fourteenth Street—Organized in 1892 as the John A. Creighton Medical College. The first class graduated in 1893. Present title in 1921. Coeducational since organization. It has a faculty of 79 professors and 76 instructors, lecturers and assistants, a total of 151. Three years of collegiate work required for admission. The B. S. degree in medicine is conferred at the end of the second year. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$376 per academic year and \$100 additional each year for students who have not taken the major part of their work at Creighton University. The registration for 1941-1942 was 224, graduates 52. The present session began July 7, 1942 and will end March 15, 1943. The subsequent session will begin March 15, 1943. The Dean is Charles M. Wilhelm, M. D.

UNIVERSITY OF NEBRASKA COLLEGE OF MEDICINE, Forty Second Street and Dewey Avenue—Organized in 1881 as the Omaha Medical College. The first class graduated in 1882. It became the Medical Department of Omaha University in 1891. In 1902 it affiliated with the University of Nebraska, with the present title. The instruction of the first two years was given at Lincoln and of the last two at Omaha until 1913 when the work of all four years was transferred to Omaha. Coeducational since 1882. The faculty is composed of 78 professors and 54 lecturers and instructors, a total of 132. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The B. S. degree in medicine is conferred at the end of the second year. The fees average \$215 per academic year. The registration for 1941-1942 was 321, graduates, 69. The present session began June 15, 1942 and will end March 15, 1943. The subsequent session will begin March 26, 1943. The Dean is C. W. M. Poynter, M. D.

## NEW YORK

## Albany

ALBANY MEDICAL COLLEGE, 47 New Scotland Avenue—Organized in 1838. The first class graduated in 1839. It became the Medical Department of Union University in 1873. In 1915 Union University assumed educational control. Coeducational since 1915. The faculty is composed of 86 professors and 109 instructors, assistants and others, a total of 195. A collegiate degree is required for admission, however, students who have completed three years of college work and who have proper specific qualifications will be admitted. This change in the requirements for admission has been instituted for the duration of the present national emergency. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The fees average \$531 per academic year. The registration for 1941-1942 was 150 graduates, 33. The present session began July 6, 1942 and will end March 27, 1943. The subsequent session will begin March 29, 1943. The Dean is R. S. Cunningham, M. D.

## Brooklyn

LONG ISLAND COLLEGE OF MEDICINE 350 Henry Street. Chartered in 1930, was originally organized in 1858 as The Long Island College Hospital. From the collegiate department the first class was graduated in 1860 and the last class in 1930. The first class of the Long Island College of Medicine was graduated in 1931. It is coeducational. It has a faculty of 122 professors, associate, assistant, clinical and assistant

clinical professors, and 206 lecturers, associates, instructors, assistants, and others, a total of 328. Three years of collegiate work, including specified courses are required for admission. The medical course covers four academic years but is being given in three calendar years for the duration of the war. The fees average \$610 per academic year. The registration for 1941-1942 was 385, graduates, 90. The present session began July 6, 1942 and will end March 30, 1943. The subsequent session begins March 29, 1943. The President and Dean is Jean Alonzo Curran, M. D.

## Buffalo

UNIVERSITY OF BUFFALO SCHOOL OF MEDICINE 24 High Street—Organized in 1846. The first class graduated in 1847. It absorbed the Medical Department of Niagara University in 1898. Coeducational since organization. The faculty is composed of 90 professors and 190 associates, assistants and others, a total of 280. The minimum requirement for admission is two years of collegiate work including certain prescribed science courses. An accelerated program has been adopted admitting a freshman class in July of each year. Seniors will graduate approximately every nine months. The fees for the entire course are \$2000. The registration for 1941-1942 was 275, graduates, 61. The present session began July 6, 1942 and will end March 1943. The subsequent session for freshmen begins July 5, 1943. The Dean is Edward W. Koch, M. D.

## New York

COLUMBIA UNIVERSITY COLLEGE OF PHYSICIANS AND SURGEONS, 630 West One Hundred and Sixty Eighth Street—The medical faculty of Columbia College then known as King's College, was organized in 1767. Instruction was interrupted by the War of the Revolution. The faculty was reestablished in 1792 and merged in 1814 with the College of Physicians and Surgeons which had received an independent charter in 1807. In 1860 the College of Physicians and Surgeons became the Medical Department of Columbia College. This merger became permanent by legislative enactment in 1891. Columbia College became Columbia University in 1896. The medical school has been coeducational since 1917. The faculty is composed of 297 professors and 583 instructors, demonstrators and others, a total of 880. Three years of collegiate work are required for admission. During the war, the school will remain in session throughout the year and entering classes will be enrolled at intervals of approximately nine months. Fees average \$538 per academic year. The registration for 1941-1942 was 428, graduates 95. The present session began July 7, 1942 and will end March 13, 1943. The subsequent session begins March 22, 1943. The Dean is Willard C. Rippley, M. D.

NEW YORK MEDICAL COLLEGE, FLOWER AND FIFTH AVENUE HOSPITALS, 1 East 105th Street—Organized in 1858. Incorporated in 1860 as the Homeopathic Medical College of the State of New York. The title New York Homeopathic Medical College was assumed in 1869, the title New York Homeopathic Medical College and Hospital in 1887, the title New York Homeopathic Medical College and Flower Hospital in 1908, the title New York Medical College and Flower Hospital in 1936, the present title of New York Medical College, Flower and Fifth Avenue Hospitals, June 22, 1938. The first class graduated in 1861. Coeducational since 1919. A baccalaureate degree or its equivalent required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. It has a faculty of 64 professors and associate professors, 47 assistant professors, 285 lecturers and assistants, a total of 396. The fees average \$663 per academic year. The registration for 1941-1942 was 328, graduates 77. The present session began July 1, 1942, and will end March 20, 1943. The subsequent session begins April 12, 1943. The Dean is J. A. W. Hetrick, M. D.

NEW YORK UNIVERSITY COLLEGE OF MEDICINE 477 First Avenue—The Medical Department of New York University (then called the University of the City of New York) was organized in 1841. In 1898 it united with the Bellevue Hospital Medical College organized in 1861, under the name of University and Bellevue Hospital Medical College. In 1935 the name was changed to New York University College of Medicine. Coeducational since 1919. The faculty is composed of 176 professors, associate, assistant, clinical and assistant clinical professors and 351 lecturers, instructors and others, a total of 527. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Entrance requirements are three full years of study in an approved college of arts and sciences. The fees average \$600 per academic year. The registration for 1941-1942 was 506, graduates, 125. The present session began June 3, 1942 and will end in March 1943. The subsequent session begins April 1, 1943. The Dean is Currier McEwen, M. D.

CORNELL UNIVERSITY MEDICAL COLLEGE 1300 York Avenue—Organized in 1898. Coeducational since organization. The first year was formerly offered to approximately one third of the class at Ithaca but in 1938 this division was discontinued and all work is now given in New York City. The faculty is composed of 161 professors and 348 instructors, assistants and others, a total of 509. All students admitted are from approved colleges for premedical training. The accepted students are largely holders of a college degree, or those having three years of college work and candidates for a baccalaureate degree on successful completion of the first year in medicine. A limited number of acceptances will be made during the present emergency, however, of students who have the equivalent of three years of college but from institutions not offering the baccalaureate degree under the professional option plan. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The tuition for the academic year is \$600 and Student Hospitalization Insurance \$9. The additional fees are as follows: matriculation fee for first year students \$10, breakage deposit for first and second year students \$10 and a

graduation fee for seniors \$25. The registration for 1941-1942 was 311 graduates 75. The present session began July 5, 1942 and will end March 25, 1943. The subsequent session will begin April 5, 1943. The Dean is Joseph C. Himes, M.D.

### Rochester

UNIVERSITY OF ROCHESTER SCHOOL OF MEDICINE AND DENTISTRY 260 Crittenden Boulevard—Organized in 1925 as the Medical Department of the University of Rochester. Coeducational since organization. The faculty is composed of 64 professors, 20 lecturers, 2 assistants, instructors and others, a total of 284. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Three years of collegiate work are required for admission. The fees average \$500 per academic year. The registration for 1941-1942 was 228 graduates 44. The present session began July 6, 1942 and will end March 20, 1943. The subsequent session begins March 29, 1943. The Dean is George Hoyt Whipple, M.D.

### Syracuse

SYRACUSE UNIVERSITY COLLEGE OF MEDICINE 776 Irving Avenue—Organized in 1872 when the Geneva Medical College chartered in 1834 was removed to Syracuse under the title. The College of Physicians and Surgeons of Syracuse University. Present title assumed in 1875 when a compulsory three-year graded course was established. The first class graduated in 1875 and a class graduated each subsequent year. In 1889 the affiliation with the university was made complete. Course extended to four years in 1896. Coeducational since organization. The faculty is composed of 51 professors and 184 associate and assistant professors, lecturers and instructors, a total of 235. Three years of a recommended college course are required for admission. An accelerated program has been adopted involving the completion of the four-year course in three years, admitting a freshman class annually. The fees average \$600 per academic year. The enrollment for 1941-1942 was 171 graduates 34. The present session began July 9, 1942 and will end March 1943. The subsequent session for freshmen will begin in July 1943. The Dean is H. G. Weikert, M.D.

## NORTH CAROLINA

### Durham

DUKE UNIVERSITY SCHOOL OF MEDICINE—Organized in 1925. The first class was admitted Oct. 1, 1930. Coeducational. The faculty is composed of 11 professors and 213 associate and assistant professors, lecturers, instructors and assistants, a total of 224. The entrance requirements are ninety hours of collegiate work. The academic year consists of four quarters of eleven weeks each, which must be taken consecutively with graduation in three calendar years. The B.S. degree in medicine may be conferred for special work after six quarters. Students are urged to spend three years in hospital or laboratory work after graduation and must give assurance satisfactory to the executive committee that they will spend at least two years. Active duty with the Army, Navy or Public Health Service can replace the second year. The fees are \$450 for each year of three quarters. The registration for 1941-1942 was 262 graduates 64. During 1942-1943 the quarters begin July 6, October 5, January 4, March 29 and end September 19, December 19, March 20 and June 12. The first year students will be enrolled March 29, 1943 and February 1, 1944. The Dean is Wilbur C. Davison, M.D.

## OHIO

### Cincinnati

UNIVERSITY OF CINCINNATI COLLEGE OF MEDICINE Eden and Bethesda Avenues—Organized in 1909 by the union of the Medical College of Ohio (founded in 1819) with the Miami Medical College (founded in 1852). The Medical College of Ohio became the Medical Department of the University of Cincinnati in 1896. Under a similar agreement March 2, 1909 the Miami Medical College also merged with the University when the title of Ohio-Miami Medical College of the University of Cincinnati was taken. Present title assumed in 1915. Coeducational since organization. Candidates for admission to the freshman class must present three years of college preparation of not less than ninety hours. Liberal Arts students of the University of Cincinnati may sign up for the seven-year combined Liberal Arts and Medical program. The B.S. degree is granted on the joint recommendation of the Faculties of the College of Liberal Arts and Medicine at the end of the first medical year. The faculty consists of 112 professors, associate and assistant professors, 350 instructors etc., a total of 462. During the period of the war emergency the college will operate on an accelerated program. A new class will be admitted every nine months. Each session will consist of thirty-two weeks of work and there will be a short recess between the major sessions. The present session began June 29, 1942 and will end February 26, 1943. The subsequent class will be admitted March 22, 1943. Tuition is as follows: For legal residents of Cincinnati \$485 a year plus breakage fees (\$50 additional for those not legal residents of Cincinnati). The registration for 1941-1942 was 307 graduates 77. The Dean is Stanley Dorst, M.D.

### Cleveland

WESTERN RESERVE UNIVERSITY SCHOOL OF MEDICINE 2109 Adelbert Road—Organized in 1843 as the Cleveland Medical College in cooperation with Western Reserve College. The first class graduated in 1844 (a celebration of the Centenary is planned for April 5 and 6, 1943). It assumed the present title in 1881. In 1910 the Cleveland College of Physicians and Surgeons was merged. Coeducational since 1919. The faculty includes 99 professors and 289 lecturers, assistants and others, a total of 388. The curriculum covers four scholastic years of 36

weeks each. During the war emergency these will be continuous so that the entire course will be completed in 144 weeks. Three years of collegiate work are required for admission and a baccalaureate degree for graduation. During the war the degree may be waived for outstanding students. The fees average \$529 per academic year. The registration for 1941-1942 was 293 graduates 60. The present session began June 22, 1942 and will end February 26, 1943. The subsequent session begins March 1, 1943. The Dean is Torald Sollmann, M.D.

## Columbus

OHIO STATE UNIVERSITY COLLEGE OF MEDICINE Neil and Eleventh Avenues—Organized in 1907 as the Starling Ohio Medical College by the union of Starling Medical College (organized in 1847 by charter granted by the State Legislature changing the name from Willoughby Medical College which was chartered March 3, 1834) with the Ohio Medical University (organized 1890). In 1914 it became an integral part of the Ohio State University with its present title. Coeducational since organization. The faculty consists of 86 professors, associate and assistant professors, 105 lecturers, instructors, demonstrators and others, a total of 191. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. Tuition fees average \$318 per academic year and \$150 additional for nonresidents. The registration for 1941-1942 was 304 graduates 79. The present session began June 21, 1942 and will end March 19, 1943. The subsequent session will begin March 30, 1943. The Acting Dean is Leslie L. Bigelow, M.D.

## OKLAHOMA

### Oklahoma City

UNIVERSITY OF OKLAHOMA SCHOOL OF MEDICINE 801 East Thirteenth Street—Organized in 1900. Until 1910 gave only the first two years of the medical course at Norman, Oklahoma, after which a clinical department was established at Oklahoma City by taking over the Medical School of Epworth University. The first class graduated in 1911. Coeducational since organization. A new medical school building and a second teaching hospital became available in 1928 and since September of that year the entire four-year course has been given in Oklahoma City. It has a faculty of 27 professors, 28 associate professors, 20 assistant professors and 122 associates, lecturers, visiting lecturers, instructors and assistants, a total of 197. Three years of college work are a prerequisite for admission. The course covers four years of nine months each. An accelerated program will be adopted beginning June 1, 1943. Fees \$50. Maintenance and Incidental Fee per semester. Other annual course fees average \$128, \$95, \$53 and \$38 in the order given, beginning with the freshman year. For students not residents of Oklahoma there is a tuition charge of \$350 a year plus laboratory and course fees as indicated for the different years. The registration for 1941-1942 was 235 graduates 33. The next session begins Sept. 14, 1942 and ends May 31, 1943. The Dean is Robert U. Patterson, M.D.

## OREGON

### Portland

UNIVERSITY OF OREGON MEDICAL SCHOOL Marquam Hill—Organized in 1887. The first class graduated in 1888 and a class graduated each subsequent year except 1898. The Willamette University Medical Department was merged in 1913. Coeducational since organization. It has a faculty of 91 professors and 164 lecturers, assistants and others, a total of 255. Entrance requirements are three years of collegiate work. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The total fees are respectively \$380, \$375, \$370 and \$376 for residents of Oregon and \$60 a year additional for nonresidents. The registration for 1941-1942 was 260 graduates 51. The present session began June 22, 1942 and will end March 20, 1943. The subsequent session will begin March 29, 1943. The Dean is Richard B. Dillehunt, M.D.

## PENNSYLVANIA

### Philadelphia

THE HAHNEMANN MEDICAL COLLEGE AND HOSPITAL OF PHILADELPHIA 235 North Fifteenth Street—Organized in 1848 as The Homeopathic Medical College of Pennsylvania. In 1869 it united with The Hahnemann Medical College of Philadelphia taking the latter title. Assumed present title in 1883. The first class graduated in 1849. Coeducational beginning with 1941-1942 session. Three years of collegiate work in an approved college of arts and sciences are required for admission. It has a faculty of 113 professors and 114 lecturers, instructors and others, a total of 227. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Fees are respectively \$515, \$512, \$512 and \$533. The registration for 1941-1942 was 541 graduates 130. The present session began July 27, 1942 and will end March 20, 1943. The subsequent session will begin April 5, 1943. The Dean is William A. Pearson, M.D.

JEFFERSON MEDICAL COLLEGE OF PHILADELPHIA 1025 Walnut Street—Organized in 1825 as the Medical Department of Jefferson College, Canonsburg, Pa. It was chartered with its present title in 1838. Classes have been graduated annually beginning 1826. In 1838 a separate university charter was granted without change of title since which time it has continued under the direction of its own board of trustees. It has a faculty of 83 professors, associate and assistant professors and 212 associates, lecturers, demonstrators and instructors, a total of 295. Four years of college work and a bachelor's degree are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months.

The total fees for the current session are, respectively \$505, \$440, \$430 (Transfers, \$480), and \$430. The registration for 1941-1942 was 530, graduates, 131. The current session for freshmen and seniors extends from June 29, 1942 to the latter part of February 1943, for sophomores and juniors from August 28, 1942 to the latter part of April 1943. The subsequent session begins April 15, 1943. The Dean is William Harvey Perkins, M.D.

**TEMPLE UNIVERSITY SCHOOL OF MEDICINE**, 3400 North Broad Street—Organized in 1901. The first class graduated in 1901. Coeducational since organization. The faculty numbers 14 professors and 247 associates, assistants and others, a total of 251. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Three years of collegiate work are required for admission. The fees average \$492 per academic year. The registration for 1941-1942 was 447, graduates 117. The present session for upper classes began July 1, 1942 and will end March 15, 1943. Freshmen enrolled Aug. 1, 1942. The subsequent session begins April 1, 1943. The Dean is William N. Parkinson, M.D.

**UNIVERSITY OF PENNSYLVANIA SCHOOL OF MEDICINE**, Thirty Sixth and Pine Streets—Organized in 1765. Classes were graduated in 1768 and in all subsequent years except 1772 and 1775-1779 inclusive. The original title was the Department of Medicine College of Philadelphia. The present title was adopted in 1909. It granted the first medical diploma issued in America. In 1916 it took over the Medical-Chirurgical College of Philadelphia to develop it as a graduate school. Coeducational since 1914. The faculty consists of 115 professors, associate and assistant professors and 434 lecturers, associates, instructors and others, a total of 549. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The tuition fee is \$500 each year, with a deposit fee of \$15, a general fee including student health of \$15 and a matriculation fee of \$5. The registration for 1941-1942 was 496, graduates 129. The present session began July 27, 1942, and will end March 27, 1943. The subsequent session begins April 5, 1943. The Dean is William Pepper, M.D.

**WOMAN'S MEDICAL COLLEGE OF PENNSYLVANIA**, Henry Avenue and Abbottsford Road, East Hills—Organized in 1950. Classes were graduated in 1952 and in all subsequent years except 1962. It has a faculty of 75 professors and 65 assistants, lecturers and others, a total of 140. At least three years of collegiate work are required for admission and candidates with a degree are given preference. The curriculum covers four years of eight and one-half months each. Total fees are \$450 yearly. The registration for 1941-1942 was 114, graduates, 18. The present session for senior students began July 1, 1942 and will end March 1, 1943. For all other classes the next session will begin Sept. 1, 1942 and end May 28, 1943. The Dean is Margaret D. Craghill, M.D.

### Pittsburgh

**UNIVERSITY OF PITTSBURGH SCHOOL OF MEDICINE**, Bigelow Boulevard—Organized in 1886, as the Western Pennsylvania Medical College and in 1908 became an integral part of the University of Pittsburgh removing to the university campus in 1910. The first class graduated in 1887. Coeducational since 1899. The faculty is composed of 30 professors and 370 associates, assistants and others, a total of 400. Entrance requirements are two years of collegiate work. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. The total fees are \$500 each year. The registration for 1941-1942 was 315, graduates, 73. The present session began July 6, 1942 and will end about March 20, 1943. The subsequent session will begin April 5, 1943. The Dean is W. S. McElroy, M.D.

## SOUTH CAROLINA

### Charleston

**MEDICAL COLLEGE OF THE STATE OF SOUTH CAROLINA**, 16 Lucas Street—Organized in 1823 as the Medical College of South Carolina. The first class graduated in 1825. In 1832 a medical college bearing the present title was chartered and the two schools continued as separate institutions until they were merged in 1838. Classes were graduated in all years except 1862 to 1865, inclusive. In 1913 by legislative enactment, it became a state institution. Coeducational from 1895 to 1912, when privileges for women were withdrawn, being restored in 1917. It has a faculty of 46 professors and 48 associates, instructors and others, a total of 94. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Three years of collegiate work are required for admission. The total fees are \$272 each year. Fees for nonresidents of the state, \$422 each year. The registration for 1941-1942 was 183, graduates, 43. The present session began June 25, 1942 and will end March 20, 1943. The subsequent class will begin March 28, 1943. The Dean is Robert Wilson, M.D.

## TENNESSEE

### Memphis

**UNIVERSITY OF TENNESSEE COLLEGE OF MEDICINE**, 874 Union Avenue—Organized in 1876 at Nashville as Nashville Medical College. First class graduated 1877, and a class graduated each subsequent year. Became Medical Department of University of Tennessee in 1879. In 1909 it united with the Medical Department of the University of Nashville to form the joint Medical Department of the Universities of Nashville and Tennessee. This union was dissolved in 1911. The trustees of the University of Nashville by formal action of that board named the University of Tennessee College of Medicine as its legal successor. In 1911 it moved to Memphis, where it united with the College of

Physicians and Surgeons. The Memphis Hospital Medical College was merged in 1913. Lincoln Memorial University Medical Department was merged in 1914. Coeducational since 1911. The faculty includes 115 professors and 138 assistants, instructors and others, a total of 253. Two years of collegiate work are required for admission. The B.S. degree in medicine is conferred at the end of the second year. The fees are \$120 quarterly. For residents of the state the charge is reduced \$50 each quarter. The registration for 1941-1942 was 470, graduates, 98. During the academic year of 1942-1943 the quarters begin July 7, Sept. 24, Jan. 1 and March 22, and end Sept. 23, Dec. 12, March 20 and June 9. The Dean is O. W. Hymann, Ph.D.

### Nashville

**McHARRIS MEDICAL COLLEGE**, Lighteenth Avenue North and Heffernan Street (1st Negro Youth)—This school was organized in 1876 as the McHerry Medical Department of Central Tennessee College, which became Walden University in 1900. First class graduated in 1877. Obtained new charter independent of Walden University in 1915. Coeducational since 1876. The faculty is made up of 49 professors and 30 instructors and lecturers, a total of 79. Three years' work in a college of liberal arts is required for admission. Tuition fees are respectively, \$300, \$290, \$280 and \$295 each year. The curriculum covers four academic years of thirty-four weeks each. Registration for 1941-1942 was 231, graduates 50. The next session begins September 28, 1942 and ends June 6, 1943. Beginning September, 1942, McHerry Medical College will institute the quarter system, beginning next school year, 1943-1944 (July). McHerry will institute an accelerated schedule. The Dean is Michael J. Bent, M.D., the President is Edward L. Turner, M.D.

**VANDERBILT UNIVERSITY SCHOOL OF MEDICINE**, Twenty First Avenue South at Hildehall—This school was founded in 1874. The first class graduated in 1875. Coeducational since 1925. The faculty numbers 251. For matriculation students must be graduates of collegiate institutions of recognized standing or seniors in absentia who will receive the bachelor degree from their college after having completed successfully one year of work in the school of medicine. The course covers four academic years of nearly nine months each, but due to the accelerated program the four year course is now completed in three calendar years. The fees average \$466 per academic year. The registration for 1941-1942 was 202, graduates 51. The present session began June 10, 1942 and will end March 22, 1943, the following session begins March 24, 1943. The Dean is Waller S. Leathers, M.D.

## TEXAS

### Dallas

**BAYLOR UNIVERSITY COLLEGE OF MEDICINE**, 810 College Avenue—Organized in 1900 as the University of Dallas Medical Department. In 1903 it took its present name and became the Medical Department of Baylor University. It acquired the charter of Dallas Medical College in 1904. Coeducational since organization. The first class graduated in 1901. The faculty consists of 117 professors and 115 instructors and assistants, a total of 232. Entrance requirements are three years of collegiate work. The course covers four years of eight months each. The fees are, respectively, \$423, \$413, \$403, \$428. The registration for 1941-1942 was 321 graduates, 75. The next session begins Sept. 28, 1942, and ends May 31, 1943. The Dean is W. H. Moursund, M.D.

### Galveston

**UNIVERSITY OF TEXAS MEDICAL BRANCH**, 912 Avenue B—Organized in 1891. The first class graduated in 1892. Coeducational since organization. It has a faculty of 40 professors and 107 instructors and assistants, a total of 147. The medical branch has been operating on an accelerated basis on a four quarter system since June 16, 1941. Each quarter consists of eleven weeks. The fees average \$70 per academic year. The registration for 1941-1942 was 384, graduates, 99. The present freshman class entered on June 22, 1942. The next senior class will complete its work in December 1942. The subsequent entering class will enroll in March 1943. The Dean is John W. Spies, M.D.

## VERMONT

### Burlington

**UNIVERSITY OF VERMONT COLLEGE OF MEDICINE**, Pearl Street, College Park—Organized with complete course in 1822. Classes graduated in 1823 to 1836 inclusive, when the school was suspended. It was reorganized in 1853 and classes were graduated in 1854 and in all subsequent years. Coeducational since 1920. It has a faculty of 61 professors and 51 instructors, and assistants, a total of 112. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class every nine months. For residents of Vermont the tuition fee is \$400 each session. The present session began July 6, 1942 and will end March 29, 1943. The subsequent session begins April 5, 1943. The Dean is Clarence H. Beecher, M.D.

## VIRGINIA

### Charlottesville

**UNIVERSITY OF VIRGINIA DEPARTMENT OF MEDICINE**—Organized in 1827. Classes were graduated in 1828 and in all subsequent years except 1865. Coeducational since the session of 1920-1921. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. It has a faculty of 47 professors and 47 lecturers, instructors, assistants and others, a total of 94. Three years of college work are required for admission. For residents

of Virginia the total fees average \$88 per academic year. Nonresidents are charged an additional \$50 each year. The registration for 1941-1942 was 249 graduates (2). The present session began June 29, 1942 and will end March 12, 1943. The subsequent session will begin March 20, 1943. The Dean is Harvey Ernest Jordan, M.D.

### Richmond

**MEDICAL COLLEGE OF VIRGINIA** Twelfth and Marshall Streets—Organized in 1838 as the Medical Department of Hampden-Sydney College. Present title was taken in 1854. In 1913 the University College of Medicine was merged. In 1914 the North Carolina Medical College was merged. Coeducational since 1918. Classes were graduated in 1839 and in all subsequent years. It has a faculty of 92 professors and 153 lecturer-instructors and others, a total of 245. Three years of collegiate work are required for admission. An accelerated program has been adopted involving the admittance and graduation of a class approximately every nine months. Fees average \$379 per academic year. Nonresidents are charged an additional \$125 each year. The registration for 1941-1942 was 0; graduates 64. The present session began July 6, 1942 and will end March 20, 1943. The subsequent session will begin April 5, 1943. The Dean is Jacques P. Gray, M.D.

## WISCONSIN

### Madison

**UNIVERSITY OF WISCONSIN MEDICAL SCHOOL**, 418 North Randall Avenue—Organized in 1907. Gave only the first two years of the medical course until 1925 when the clinical year was added. Coeducational since organization. Three years of collegiate work are required for admission. The B.S. degree in medical science is conferred at the end of the first year. An accelerated program has been adopted involving the admittance of a class once a year and a graduating class every nine months. It has a faculty of 64 professors and 67 lecturers-instructors and others, a total of 131. The fees average \$206 per academic year. An additional fee of \$200 each year is charged nonresidents. The registration for 1941-1942 was 257 graduates, 45. The present session began July 1, 1942 and will end March 2, 1943. The subsequent session for freshmen will begin July 1, 1943. The Acting Dean is Walter L. Meek, M.D.

### Milwaukee

**MARQUETTE UNIVERSITY SCHOOL OF MEDICINE**, 561 North Fifteenth Street—Organized in December 1912 by the merger of the Milwaukee Medical College and the Wisconsin College of Physicians and Surgeons. Coeducational since organization. It has a faculty of 191. Three years of collegiate work are required for admission. The curriculum covers the equivalent of four years of eight and a half months each and a one-year internship in an approved hospital. During the duration of the war the accelerated program will cover three semesters each calendar year. The fees average \$452 per academic year. The registration for 1941-1942 was 332 graduates, 70. The present session began July 6th, 1942 and will end February 25, 1943. The subsequent session begins March 1, 1943. The Dean is Eben J. Carey, M.D.

## CANADA

### Alberta

**UNIVERSITY OF ALBERTA FACULTY OF MEDICINE** Edmonton—Organized in 1913. Coeducational since organization. Has given the complete six-year medical course since 1924. New course—three years premedical, four years medicine, 1 year internship for medical degree commences 1942-43. The Faculty includes 23 full-time and 45 part-time professors, instructor, assistants and others, a total of 68. Tuition for the second, third and fourth years is \$225; for the fifth and sixth years \$235. The registration for 1941-1942 was 194 graduates, 47. The present session (accelerated) began June 1, 1942 and will end January 4, 1943. All medical classes are being accelerated. The following session opens February 1, 1943. The Acting Dean is John James Ower, M.D.

### Manitoba

**UNIVERSITY OF MANITOBA FACULTY OF MEDICINE** Bannatyne Avenue, Winnipeg—Organized in 1883 as Manitoba Medical College, first class graduated in 1886 and a class graduated each subsequent year. The college transferred all its property to the University of Manitoba in 1919 and assumed the present title. Coeducational since organization. The faculty includes 26 professors and 80 instructors and assistants, a total of 106. Matriculation requirements include two years of collegiate work in the faculty of arts and science of a recognized university. An accelerated program has been adopted. The present session began for 1st year, Aug. 1, 2nd year, July 27, 3rd and 4th years, July 20 and will end March 20, March 31, April 5 and March 31, 1943. The Dean is A. T. Mathers, M.D.

### Nova Scotia

**DALHOUSIE UNIVERSITY FACULTY OF MEDICINE** Morris Street, Halifax—Organized in 1867. Incorporated as the Halifax Medical College in 1875. Reorganized as an examining faculty separate from the Halifax Medical College in 1885. In 1911 in accordance with an agreement between the Governors of Dalhousie University and the Corporation of the Halifax Medical College the work of the latter institution was discontinued and a full teaching faculty was established by the university. First class graduated in 1872. Coeducational since 1871. It has a faculty of 39 professors and 38 demonstrators, lecturers and others, a total of 77 of whom are in active service and are on leave for the duration

requires for matriculation two years of arts. The regular medical course covers four years and a hospital internship of one year. In order to meet the needs of the Canadian Armed Forces the classes in the first three years have been accelerated. The content of the third and fourth years remains the same but holidays have been practically eliminated. The final year internship has for the time being been reduced to eight months. The third and fourth years began their studies on May 14th and continue until the end of December. The first and second years will begin on September 8, 1942 and end on May 11, 1943. The fees average \$314 yearly. \$250 additional registration fee payable by students outside the British Empire. The registration for 1941-1942 was 164, graduates 42. The Dean is H. G. Grant, M.D.

## Ontario

**QUEEN'S UNIVERSITY FACULTY OF MEDICINE** Kingston—Organized 1854, first class graduated in 1855 and a class graduated each subsequent year. The faculty numbers 65. The fees average \$232 yearly. The course covers six years of thirty teaching weeks each. An accelerated program has been adopted and the course may now be completed in four and one-half years. Freshmen will be admitted annually. The registration for 1941-1942 was 266 graduates, 41. The next session begins for 3rd, 4th, 5th and 6th year students on June 1, 1942, for 2nd year students on August 24, 1942 and for 1st year students on September 22, 1942. The next class will graduate Dec. 31, 1942. The Dean is Frederick Etherington, M.D.

**UNIVERSITY OF TORONTO FACULTY OF MEDICINE** Toronto—Organized in 1843 as the Medical Faculty of King's College. Abolished in 1853. Reestablished in 1887. In 1902 it absorbed Victoria University Medical Department and in 1903 it absorbed the Medical Faculty of Trinity University. Coeducational since 1903. The B.Sc. (Med.) degree is conferred at the end of the third or sixth year. It has a faculty of 77 professors and 348 lecturers, associates and others, a total of 425. The fees are \$240 for the first year, for the second \$315, \$315 for the third year, \$340 for the fourth and fifth years and \$348 for the sixth year. The registration for 1941-1942 was 804 graduates, 116. An accelerated program has been adopted and the duration of the academic session has been increased to ten months extending from August 24, 1942 to June 26, 1943. The final year class will graduate Dec. 31, 1942 and every eight months thereafter. The Dean is W. E. Gallie, M.D.

**UNIVERSITY OF WESTERN ONTARIO MEDICAL SCHOOL** Ottawa Avenue, London—Organized in 1881 as the Western University Faculty of Medicine, first class graduated in 1883 and a class graduated each subsequent year. Present title in 1923. The medical school has been under the control of the Board of Governors of the University of Western Ontario since 1913. Coeducational since 1913. The faculty numbers 95. The normal course of study covers six years of eight months each. The total fees to residents of Canada for the last four years respectively are \$352, \$348, \$356 and \$228. Nonresidents are charged \$642, \$638, \$646 and \$391 for each of the last four years. The registration for 1941-1942 was 224 graduates, 36. Owing to war conditions, the next session begins for the sixth year August 24, 1942 and ends December 31, 1942. Classes for the second, third, fourth and fifth years begin August 24, 1942 and end for the second year June 19, 1943 for the third year May 29, 1943 for the fourth and fifth years February 6, 1943. The Dean is F. J. H. Campbell, M.D.

## Quebec

**LAVAL UNIVERSITY FACULTY OF MEDICINE** Quebec—The Quebec School of Medicine organized in 1848 became in 1852 the Laval University Faculty of Medicine, first class graduated in 1855 and a class graduated each subsequent year. An accelerated program has been adopted. The faculty numbers 91. The fees for each of the medical years are \$175 for residents of Canada. Nonresidents are charged an extra fee of \$175 each year. The premedical requirement is a B.A. degree or its equivalent. The registration for 1941-1942 was 324, graduates, 65. The present session for the 2d, 3d, 4th and 5th years began July 15, 1942. The next class will graduate Jan. 31, 1943. Freshmen will enrol Sept. 1, 1942. The Dean is Charles Vézina, M.D.

**MCGILL UNIVERSITY FACULTY OF MEDICINE** 3640 University Street, Montreal—Founded in 1823 as Montreal Medical Institution, became the Medical Faculty of McGill University in 1829, first class graduated under the university auspices in 1833. No session between 1836-1839 owing to political troubles. In 1905 it absorbed the Faculty of Medicine of the University of Bishop's College. Coeducational since 1919. Three years of collegiate work are required for admission. An acceleration program has been adopted for the upper classes. The faculty consists of 61 professors and 199 lecturers and others, a total of 260. The total fee for each of the four medical years are \$391 plus \$100 for non-British subjects. The registration for 1941-1942 was 397 graduates, 90. The present session for sophomores, juniors and seniors began June 15, 1942. Freshmen will enrol Sept. 9, 1942. The next class will graduate January 31, 1943. The Dean is J. C. Meakins, M.D.

**UNIVERSITY OF MONTREAL FACULTY OF MEDICINE** 1265 St. Denis Street, Montreal—Organized in 1843 as the Montreal School of Medicine and Surgery. In 1891 by Act of Parliament the Medical Faculty of Laval University (organized in 1878) was absorbed. Present name by Act of Parliament in 1920. A class was graduated in 1843 and each subsequent year. Coeducational since 1925. The faculty numbers 150. The B.A. or B.S. degree or its equivalent is the premedical requirement. An accelerated program has been adopted. An internship is required for graduation. The fees average \$239 yearly. The registration for 1941-1942 was 209 graduates, 48. The present session for juniors and seniors began June 1, 1942 and will end March 31, 1943. Freshmen and sophomores will enrol Sept. 1, 1942 and will complete the year April 17, 1943. The Dean is Albert LeSage, M.D.

## DESCRIPTION OF SCHOOLS OF THE BASIC MEDICAL SCIENCES

## ALABAMA

## University (Tuscaloosa)

UNIVERSITY OF ALABAMA SCHOOL OF MEDICINE—Organized in 1859 at Mobile as the Medical College of Alabama. Classes graduated in 1861 and subsequent years excepting 1862 to 1869 inclusive. Reorganized in 1897 as the medical department of the University of Alabama. Present title assumed in 1907 when all property was transferred to the University of Alabama. In 1920 clinical teaching was suspended and the medical school was removed to the university campus near Tuscaloosa. Coeducational since 1920. Minimum entrance requirements are three years of collegiate work. An accelerated program has been adopted and a new freshman class will be admitted approximately every nine months. The faculty includes 15 professors and 14 instructors, assistants and others a total of 29. The tuition fees are \$301 each academic year plus \$75 differential for nonresidents. The registration for 1941-1942 was 98. The present session began June 6, 1942 and will end February 5, 1943. The subsequent session will begin March 11, 1943. The Dean is Stuart Graves, M.D.

## MISSISSIPPI

## University

UNIVERSITY OF MISSISSIPPI SCHOOL OF MEDICINE—Organized in 1903. Coeducational since organization. A clinical department was established at Vicksburg in 1908 but was discontinued in 1910 after graduating one class. An accelerated program has been adopted and a new freshman class is admitted each nine months. Entrance requirement is three years of collegiate work or ninety semester hours of credit. The B.S. degree in medicine is conferred at the end of the second year. The faculty includes 9 professors, 2 assistant professors, 1 adjunct professor, 17 instructors, assistants and others a total of 29. The total fees of the first year are \$375, and for the second year \$349. The registration for 1941-1942 was 55. The present session began June 1, 1942 and will end January 30, 1943. The subsequent session begins February 1, 1943. The Dean is B. S. Guyton, M.D.

## MISSOURI

## Columbia

UNIVERSITY OF MISSOURI SCHOOL OF MEDICINE—Organized at St. Louis in 1845, was discontinued in 1855 but was reorganized at Columbia in 1872. Teaching of the clinical years was suspended in 1909. Coeducational since 1922. An accelerated program has been adopted involving the admittance of a class every nine months. The faculty includes 20 professors and 15 instructors, lecturers and others a total of 35. The entrance requirements are 90 semester hours of collegiate work. The B.S. degree in medicine is conferred at the end of the second year. Total fees for the first year are \$225, for the second \$215. The registration for 1941-1942 was 71. The current session began June 15, 1942 and will end March 18, 1943. The subsequent session will begin March 22, 1943. The Dean is Dudley S. Conley, M.D.

## NEW HAMPSHIRE

## Hanover

DARTMOUTH MEDICAL SCHOOL—Organized by Dr. Nathan Smith in 1797. The first class graduated in 1798. It is under the control of the trustees of Dartmouth College. Courses of the third and fourth year were discontinued in 1914. The faculty consists of 21 professors and 13 instructors, a total of 34. Three years of collegiate work are required for admission. An accelerated program has been adopted admitting a freshman class approximately every nine months or eight months of actual teaching. Candidates for the A.B. degree in Dartmouth College may substitute the work of the first year in medicine for that of the senior year in the academic department. The tuition is \$450 for each year. The registration for 1941-1942 was 46. The present session began May 25, 1942 and will end Feb. 13, 1943. The subsequent session begins February 14, 1943. The Dean is John P. Bowler, M.D.

## NORTH CAROLINA

## Chapel Hill

UNIVERSITY OF NORTH CAROLINA SCHOOL OF MEDICINE—Organized in 1890. Until 1902 this school gave only the work of the first two years when the course was extended to four years by the establishment of a department in Raleigh. The first class graduated in 1903. A class was graduated each subsequent year, including 1910, when the clinical department at Raleigh was discontinued. Coeducational since 1914. A minimum of three years of college work is required for admission. Certificates are awarded on the completion of two years' work in medicine. The faculty is composed of 20 professors and 13 instructors, a total of 33. The fees for each year are \$300 for residents, for nonresidents an additional fee of \$100. The registration for 1941-1942 was 86. The school has gone on the accelerated schedule for the duration of the war. The 1942 session began June 15, and new sessions will begin approximately every nine months. The 1943 session will begin March 15, 1943. The Dean is W. Reece Berryhill, M.D.

## Winston-Salem

BOWMAN GRAY SCHOOL OF MEDICINE OF WAKE FOREST COLLEGE, WINSTON SALEM, N. C.—Organized in 1902 by Wake Forest College. Prior to 1941 it was located on the campus of Wake Forest College where it was known as the Wake Forest College School of Medical Sciences

offering only the first two years. During the next session, instruction will be offered to freshmen, sophomores and juniors. Instruction covering the complete four years will follow one session later. Ninety semester hours of college work are required for admission. The B.S. degree is given after the completion of the first year to those not already holding that degree. An accelerated program has been adopted involving the admittance of a freshman class approximately every nine months. The faculty numbers 55 full-time professors, assistant professors and instructors, and 58 part-time clinical professors, assistant professors, instructors and assistants making a total of 113. Tuition for each academic year is \$450. Registration for the year 1941-1942 was 73. The present session began June 29, 1942 and will end March 18, 1943. The subsequent sessions begin March 23, 1943. The Dean is C. C. Carpenter, M.D.

## NORTH DAKOTA

## Grand Forks

UNIVERSITY OF NORTH DAKOTA SCHOOL OF MEDICINE—Organized in 1905. Offers only the first two years of the medical course. Coeducational since organization. Three years' work in a college of liberal arts is required for admission. The B.S. degree in combined arts-medical course is conferred at the end of the second year. The faculty consists of 7 professors and 8 instructors, a total of 15. The fees are \$113, each year for resident students and \$198 for nonresidents. The registration for 1941-1942 was 53. The next session begins Sept. 28, 1942 and ends May 24, 1943. The Dean is H. E. French, M.D.

## SOUTH DAKOTA

## Vermillion

UNIVERSITY OF SOUTH DAKOTA SCHOOL OF MEDICAL SCIENCES—Organized in 1907 as the University of South Dakota School of Medicine. Present title in 1937. Coeducational since organization. Offers only the first two years of the medical course. Three years' work in a college of liberal arts is required for admission. Students who complete the third year of premedical work in the College of Arts and Sciences at the University of South Dakota may apply the work of the first year of medicine to the A.B. degree. The B.S. degree is conferred at the end of the second year on those students who do not hold a combination (Arts and Sciences and Medicine Course) A.B. degree. The faculty numbers 18. An accelerated program has been adopted involving the admittance of a class approximately every nine months. The tuition is \$150 each year for residents and \$250 for nonresidents. The registration for 1941-1942 was 40. The present session began June 15, 1942 and will end Feb. 27, 1943. The subsequent session will begin March 8, 1943. The Dean is Joseph C. Ohlmecher, M.D.

## UTAH

## Salt Lake City

UNIVERSITY OF UTAH SCHOOL OF MEDICINE, University Street—Organized in 1906. Coeducational since organization. Gives only first two years of medical course. An accelerated program has been adopted involving the admittance of a class every nine months. Three years of collegiate work are required for admission. The medical faculty consists of 11 professors, 1 instructor, 21 lecturers and demonstrators and 5 fellows, assistants, and technicians a total of 38. The fees for each year are \$229. There is a nonresident fee of \$75 each year. The registration for 1941-1942 was 66. The present session began June 29, 1942 and ends March 20, 1943. The subsequent session begins March 20, 1943. The Acting Dean is C. B. Freudenberger, M.D.

## WEST VIRGINIA

## Morgantown

WEST VIRGINIA UNIVERSITY SCHOOL OF MEDICINE—Organized in 1902, gives the first two years of the medical course. Coeducational since organization. Three years of collegiate work are required for admission. The B.S. degree in medicine is conferred at the end of the second year. An accelerated program has been adopted involving the admittance of a class every nine months. Faculty numbers 24. Fees for residents of the state are, respectively, \$255 and \$265, nonresidents, \$150 additional each year. The registration for 1941-1942 was 51. The present session began June 1 and will end March 17, 1943. The subsequent session begins March 22, 1943. The Dean is Edward J. Van Liere, M.D.

## CANADA

## Saskatchewan

UNIVERSITY OF SASKATCHEWAN SCHOOL OF MEDICAL SCIENCES, Saskatoon—Organized in 1926. Coeducational. Offers the first two years of the medical course. An accelerated program has been adopted. Two years of collegiate work are required for admission. The B.A. degree is conferred at the end of the second year. The medical faculty includes 7 professors and 4 lecturers and assistants a total of 11. The fees are \$150 for each year. The registration for 1941-1942 was 48. The next session begins September 21, 1942 for the first year and ends May 15, 1943. The second year begins June 1, 1942 and ends December 19, 1942. The Dean is W. S. Lindsay, M.B.

## INTERNSHIPS, RESIDENCIES AND FELLOWSHIPS

(See List Pages 1311-1344)

The 732 hospitals approved for intern training in February 1942 offered a total of 7,228 internship appointments annually. These in relation to the number of medical graduates—5,275 in 1941—would indicate a shortage of nearly 2,000 interns but actually in view of the availability of second year men the approved hospitals had only 927 unfilled positions at the time of reporting. The number of vacancies has since increased however because of the curtailment of many of the advanced training courses and the appointment of additional interns in some hospitals to compensate for the lack of residents. In this connection it would seem particularly essential that all hospitals cooperate in maintaining an equitable distribution of interns by limiting their appointments to actual minimum needs. As a general rule the ratio of house officers to patients should not exceed one intern to six hundred annual admissions.

## INCREASED PRODUCTION OF INTERNS

The present shortage of interns has a compensatory factor in the accelerated program of undergraduate training now adopted by most of the approved medical schools. Thus within three years there will be four graduating classes available totaling 21,029 students as indicated previously in the section on undergraduate education. The first impact of this program will be felt in March 1943 when approximately 4,180 graduates will be ready to begin their intern service three months ahead of the usual date. Since the previous group will not have completed its service until July, there will be an overlapping of assignments for three months unless the older interns can be advanced to senior positions or be assigned to affiliate services in other hospitals that are short of house officers. If the affiliate plan is adopted the original hospital should maintain supervision and be responsible for the entire educational period, otherwise it would not be in position to offer an internship certificate covering the last three months of training.

## CHANGES IN INTERNSHIPS

The Council on Medical Education and Hospitals and the Association of American Medical Colleges have both recommended that internships should not be reduced below twelve months. The essential character of the intern service has likewise been recognized by the Army, Navy and Selective Service, which have made provisions whereby medical students may be deferred from active military duty until they have completed a year of hospital training. The individual hospitals, however, are confronted with the problem of integrating the one year internship with the accelerated medical curriculum under which a new class graduates every nine months. That intern services are rapidly being modified to coincide with the change in graduation dates is apparent from reports received in July 1942 indicating that 544 hospitals have recently readjusted their appointment schedule. At the same time there has been a reduction in the number of long term assignments, as evidenced by the fact that 711 hospitals are now offering one year internships as compared with 608 last February. Five have scheduled an eighteen months service, 9 a two year internship, and 14 a combination of assignments varying from twelve

to twenty-four months. The corresponding figures at the beginning of the year were 17, 71 and 36. Of the hospitals currently approved 687 offer a rotating service, 12 have mixed internships and 19 provide straight assignments, while 21 have more than one type. Previous reports were 660, 27, 18 and 27 respectively. The list of approved internships published in this issue contains in addition to the clinical data up to date information concerning the number of interns required annually, type of internship, length of service, date of appointment, beginning of service and monthly stipend. The approved hospitals now total 739, the approved internships 8,349.

## NECROPSY PERFORMANCE

The necropsy rate has long been considered an index of the scientific attitude of the medical staff and the progressiveness of the hospital's educational service. It is of interest to note, therefore, that in 1941 the hospitals approved for intern training reported 211,935 deaths and 82,587 necropsies an average ratio of 38.97 per cent. Of 727 hospitals reporting, 42 attained

## Highest Necropsy Rates in Approved Internship Hospitals—1941

|   | Control          | Per centage |
|---|------------------|-------------|
| 1 U. S. Naval Hospital Great Lakes Ill                    | Navy             | 110         |
| 2 William Beaumont General Hospital El Paso Texas         | Army             | 95.3        |
| 3 Station Hospital (Fort Sam Houston) San Antonio         | Army             | 92.8        |
| 4 Research and Educational Hospitals Chicago              | State            | 91.2        |
| 5 Colorado General Hospital Denver                        | State            | 90.9        |
| 6 Hospital of the University of Pennsylvania Philadelphia | Non Profit Ass'n | 89.9        |
| 7 Trinity Hospital Mount Vernon D. C.                     | Church           | 88.2        |
| 8 University of California Hospital San Francisco         | State            | 88.7        |
| 9 Walter Reed General Hospital Washington D. C.           | Army             | 86.6        |
| 10 U. S. Naval Hospital San Diego                         | Navy             | 84.8        |
| 11 University of Nebraska Hospital Omaha                  | State            | 84.2        |
| 12 Mary Hitchcock Memorial Hospital Hanover N. H.         | Non Profit Ass'n | 84.0        |

| 14 U. S. Marine Hospital Chicago                          | U. S. P. H. S.   | 81.8        |
| 15 University of Chicago Clinics Chicago                  | Non Profit Ass'n | 81.3        |
| 16 Evanston Hospital Evanston Ill.                        | Non Profit Ass'n | 80.0        |
| 17 Presbyterian Hospital Philadelphia                     | Church           | 79.7        |
| 18 Columbus Hospital Chicago                              | Church           | 79.4        |
| 19 U. S. Marine Hospital Seattle                          | U. S. P. H. S.   | 78.9        |
| 20 Letterman General Hospital San Francisco               | Army             | 78.7        |
| 21 Wesley Memorial Hospital Chicago                       | Church           | 78.6        |
| 22 U. S. Naval Hospital Washington D. C.                  | Navy             | 77.8        |
| 23 U. S. Naval Hospital Bremerton Wash.                   | Navy             | 77.8        |
| 24 St. Elizabeth's Hospital Washington D. C.              | U. S. P. H. S.   | 77.6        |
| 25 U. S. Marine Hospital San Francisco                    | U. S. P. H. S.   | 77.5        |
| 26 Santa Fe Coast Lines Hospital Los Angeles              | Non Profit Ass'n | 76.6        |
| 27 U. S. Naval Hospital Mare Island Calif.                | Navy             | 75.9        |
| 28 Massachusetts Memorial Hospital Boston                 | Non Profit Ass'n | 75.9        |
| 29 Queens General Hospital Jamaica N. Y.                  | City             | 75.2        |
| 30 Fitzgerald Mercy Hospital Darby Pa.                    | Church           | 75.2        |
| 31 Passavant Memorial Hospital, Chicago                   | Non Profit Ass'n | 74.6        |
| 32 Kansas City General Hospital Kansas City Mo.           | City             | 74.1        |
| 33 Johns Hopkins Hospital Baltimore                       | Non Profit Ass'n | 73.9        |
| 34 St. Barnabas Hospital Minneapolis                      | Non Profit Ass'n | 73.7        |
| 35 St. Luke's Hospital Kansas City Mo.                    | Church           | 73.7        |
| 36 State of Wisconsin General Hospital Madison            | State            | 72.9        |
| 37 St. Mary's Hospital Duluth                             | Church           | 72.2        |
| 38 University of Kansas Hospitals Kansas City Kan.        | State            | 71.7        |
| 39 University Hospitals Minneapolis                       | State            | 71.7        |
| 40 Strong Memorial Hospital Rochester                     | Non Profit Ass'n | 71.2        |
| 41 St. Luke's Hospital Duluth                             | Non Profit Ass'n | 71.0        |
| 42 Lankenau Hospital Philadelphia                         | Non Profit Ass'n | 70.4        |

the highly commendable rate of 70 per cent or over, 121 had 50-69 per cent, 290 were in the 30-49 per cent group and 262 had 15-29 per cent, whereas 12 were below the minimum requirement of 15 per cent. In the accompanying table on Highest Necropsy Rates are

shown the hospitals in which postmortem examinations exceeded 70 per cent of the fatalities. This achievement not only serves to improve the quality of educational service in individual hospitals but helps to stimulate others to greater effort. It is particularly encouraging to note that small as well as large institutions are included and that private and public hospitals are about equally represented.

Classification of Approved Residencies and Fellowships—1942

| Specialty                           | Residencies | Asst Residencies | Fellowships | Total | No of Hospitals |
|-------------------------------------|-------------|------------------|-------------|-------|-----------------|
| Anesthesiology                      | 81          | 0                | 10          | 121   | 15              |
| Cardiology                          | 5           | 1                | 1           | 9     | 6               |

| Totals                              | 3,010       | 1,978            | 320         | 5,487 | *               |

residencies, the number of inpatients in each service, outpatient visits, deaths, necropsies, number of residents, assistant residents, and fellows, and the initial monthly stipend. The present list offers similar data regarding the various residencies and fellowships in the 662 hospitals approved by the Council. In the table showing classification of services there are 3,010 residencies listed, 1,938 assistant residencies and 539 fellowships, a total of 5,487.

Those figures are based chiefly on information received in January 1942 and therefore represent the number of residencies and fellowships ordinarily available under normal conditions. Many of the services have since been curtailed because of military requirements, yet there is every indication that the present educational structure will be maintained in such a manner as to be able to meet both current and future residency needs. The Council will continue to gather information regarding educational services in hospitals in order that accurate and up to date information may be regularly available to the medical profession, governmental agencies and other interested groups.

OPPORTUNITIES FOR LATIN-AMERICAN  
PHYSICIANS

A program of graduate training has recently been formulated by the W K Kellogg Foundation whereby twenty-five carefully selected physicians of the Latin-American countries will be brought to the leading ophthalmologic institutions of the United States for a minimum of one year's training.

This program of graduate instruction in ophthalmology will be carried on with the cooperation of the Division of Cultural Relations of the Department of State which has previously made arrangements whereby selected medical graduates of Central and South American countries may secure an opportunity for intern training in approved hospitals in the United States. These opportunities for interns and graduate students are clearly indicative of continued progress in Pan American relationships in the field of medical education.

ESSENTIALS OF AN APPROVED INTERNSHIP

(Revised June 1942)

I Introduction

- 1 The primary function of a hospital is to provide facilities where the sick and injured may be given scientific medical care.
- 2 The operation of a well organized, effective program for the training of interns enhances the quality of care rendered to the sick and in no wise conflicts with the chief purpose for which the hospital is maintained.
- 3 An important purpose of the internship is to supplement the undergraduate medical course by a well rounded experience of closely supervised clinical practice in diagnosis and therapy.
- 4 Hospitals which are approved for the training of interns accept a serious responsibility to their interns and to the communities in which they may later practice.
- 5 The internship is one of the most important phases of medical education. Internships designed without a well supervised educational program, or arranged merely to provide hospitals with resident personnel to relieve visiting physicians of tasks which they do not wish to perform, cannot be approved.

II The Internship

- 1 BASIS OF THE INTERNSHIP—The internship is a form of apprenticeship. The intern assists in the care of patients and receives in return instruction from the hospital staff in the clinical and laboratory aspects of his profession.
- 2 LENGTH OF INTERNSHIP—An internship should be of not less than twelve months' duration. Longer periods of service

are desirable because they permit a more satisfactory educational program and allow the intern sufficient time in which to be trained adequately to assume increasing responsibility in various fields of medicine.

3 TYPES OF INTERNSHIP—The Council approves "rotating," "mixed" and "straight" internships.

A "rotating" internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis.

A "mixed" internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named.

A "straight" internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology.

In rotating and mixed internships of a year's duration the time allotted to internal medicine should equal or exceed the time given to any other service. Not more than six months' time in a year's rotating or mixed internship should be devoted to any one branch of the service, including its related specialties. Too frequent a rotation of assignments in such intern

ships is undesirable. Arrangements should be made so that each intern shall devote at least two consecutive months respectively to internal medicine and to surgery.

### III Hospitals Eligible for Approved Internships

The experience of the Council indicates that the requirements for an approved internship can be met only in a general hospital registered by the American Medical Association admitting at least 2500 patients or more per year having an average daily census of at least 85 patients exclusive of the newborn and providing a sufficient number and variety of patients in the several branches of medicine in which it undertakes to train interns. For the purpose of this section patients who are not available to the interns for clinical study are not included.

### IV The Hospital Staff

1 **THE STAFF**—The staff both visiting and intern should be composed of physicians who are graduates of medical schools acceptable to the Council. The visiting staff should be composed of physicians (a) who are of unquestioned professional and moral integrity (b) who are proficient in the fields of practice to which they devote themselves (c) who give personal attention to the patients under their charge and (d) who pledge themselves both individually and as a group to provide ample instruction to the intern staff and to cooperate in their work.

### V Clinical Records

1 **HISTORIES**—Adequate records should be maintained. The attending physician or surgeon should be directly responsible for the accuracy and completeness of clinical records concerning all patients under his care.

2 **ENDORSEMENT OF RECORDS**—All case records should show by signature the names of the persons who have written them or their individual parts. Orders for treatment or for special diagnostic studies and progress notes should be signed by the person who writes them. Case histories and physical examinations completed by interns should give evidence of having been verified by the attending physician.

3 **FILING AND INDEXING RECORDS**—A competent medical record librarian should be in charge of the filing and indexing of records. To be of educational value all case records should be readily available for special study or for reference work. When a patient is readmitted to the hospital, all previous records of his case should be obtainable without undue loss of time. Besides the usual indexes of patients by name and number, there should be an index arranged according to primary and secondary diagnoses, all surgical procedures should be listed, and the names of physicians who refer patients to the hospital should also be recorded. Statistics concerning the hospital's clinical work should be compiled monthly and should be available at all times to the medical staff. An analysis of these figures should be included in the annual report and should be classified by departments, i. e. internal medicine, surgery, obstetrics, pediatrics (excluding the newborn), gynecology, ophthalmology, otolaryngology and so on, presenting for each department at least the following data concerning private and ward services:

Number of patients admitted or discharged  
Number of hospital days of care or average daily census  
Deaths and necropsies  
Surgical procedures

### VI Laboratories

1 **EQUIPMENT**—There should be clinical and pathologic laboratories in the hospital, under competent direction. The laboratory or laboratories should be equipped and staffed to perform ordinary routine tests, including bacteriologic, serologic, chemical, basal metabolic and tissue examination.

2 **THE PATHOLOGIST**—The pathologist should hold the degree of doctor of medicine from an approved medical school and should have qualifications in pathology acceptable to the Council. He should give to the hospital sufficient time to enable him (a) to supervise adequately the work done in the main pathologic laboratory of the hospital and in its branch laboratories if any, (b) to examine or supervise the examination of all tissues removed in surgical operations and to furnish reports of their gross and microscopic findings, (c) to perform or supervise the

performance of all necropsies conducted in the hospital and render a full report of the findings, (d) to assist in the teaching of interns (e) to be available for consultation with members of the attending and intern staff meetings and conduct or participate in clinical pathologic and departmental conferences.

3 **NECROPSIES**—The hospital should provide proper facilities for the conduct of postmortem examinations in the presence of interns and staff. The necropsy rate has come to be recognized as an index of the scientific interest of the medical staff, and well performed postmortem examinations enable progressive physicians to improve their clinical ability. No hospital will be approved for intern training which does not maintain each year a record of necropsies performed in at least 15 per cent of its deaths exclusive of stillbirths and cases released to legal authorities. Beginning with the calendar year 1943, a minimum of thirty-six necropsies a year will also be required.

4 **RECORDS**—A copy of each examination performed in the laboratory of pathology should be retained in the department in addition to the copy filed on the patient's clinical record. All these examination reports should be indexed by name, number and diagnosis. Slides for microscopic study of specimens removed at operation or by necropsy should also be filed in the laboratory.

### VII Radiology

1 **EQUIPMENT**—This department should be equipped with suitable shockproof apparatus. The rooms provided for fluoroscopy and for viewing roentgenograms should be large enough to accommodate comfortably both interns and attending physicians during the examination of patients or interpretation of films.

2 **THE RADIOLOGIST**—The radiologist should hold the degree of doctor of medicine from an approved medical school and should have qualifications in radiology acceptable to the Council. He should give to the hospital sufficient time to supervise adequately the technical work of the department, to perform or supervise fluoroscopic examinations, to interpret films to consult with staff physicians and to instruct the interns. He should also attend staff meetings and the meetings of his department.

3 **RECORDS**—A copy of each examination report should be kept in the department in addition to the one filed in the patient's record. These reports and their original films should be filed and indexed by name, number and diagnosis.

### VIII Medical Library

There should be a medical library, in charge of a competent librarian located where it is readily accessible to the interns and staff and containing a useful collection of recent editions of standard text and reference books and current files of not less than ten of the representative medical journals. Interns should be encouraged to use the library in connection with their clinical work and may properly be asked to report on current medical opinion concerning any special case at the bedside or to review current literature on any selected topic more formally at staff conferences or at journal club meetings that may be organized for the purpose of stimulating an interest in reading.

### IX Organization for Intern Training

1 **THE STAFF** should be organized into departments or sections representing such specialties as internal medicine, surgery, pediatrics, obstetrics, pathology and radiology, in order to administer the professional services of the hospital and to supervise the program of intern training to best advantage. Overdepartmentalization should be avoided, although in large hospitals departmentalization may extend to include such other specialties as ophthalmology, otolaryngology, orthopedic surgery, urology, neurology and psychiatry. Each department or section should have a chairman or department head to serve for at least a year. He should be well qualified for this position by experience in his special field, should be responsible for the general conduct of the clinical work in his department and should help to formulate and execute the intern training plan to be carried out in his department. Frequent rotation of attending physicians in charge of the various services should be avoided. Assignments should be made so that the intern has opportunity

each day to meet his attending physician for the conduct of systematic ward rounds or clinics and for the study of the patients under his care. In hospitals where the management of private patients is part of the intern's responsibility, no intern should be called on to assist at any one time an unreasonable number of attending or visiting physicians.

**2 CONFERENCES**—The staff, either as a whole or by departments, should conduct periodically and at least once a month, staff or departmental meetings in which the work of the various clinical or laboratory services is thoroughly analyzed. Interns should be expected to attend and to take an active part in these meetings. Each month there should be one or more clinical-pathologic conferences. In addition, there should be such departmental conferences as the current activities of the various departments may require. These conferences should be educational in nature and more than a perfunctory demonstration of interesting material. As has been suggested, the intern also should be encouraged to read medical literature in connection with his clinical work and may properly be asked to report formally on current medical opinion concerning any special case.

**3 INTERN COMMITTEE**—There should be a committee of the staff, chosen from the chairmen of the several departments in the hospital, charged with the duty of organizing, supervising and evaluating the plan of intern instruction. The teaching obligations of individual staff members cannot be delegated to this committee but should be supervised by it.

### X Nature of the Intern's Duties

Each intern on duty in any clinical department should write or dictate the history, physical examination and his own diagnostic impression of all patients assigned to him. He should have laboratory work assigned to him of such nature as to give him familiarity with clinical laboratory methods and to develop in him competence in the use of all those which the average physician may be called on to perform. The nonoperative treatment of each patient should, in the main, be his responsibility under critical guidance by the visiting physician.

The intern's record should be checked within twenty-four hours by a competent supervising physician, calling attention to errors in observation and adding supplementary notes containing any relevant data which the intern may have omitted. If the intern's record is acceptable, the attending physician should countersign and thus approve it. The intern should enter notes of progress on the record, describing the patient's clinical course from time to time and make sure that all treatments or special diagnostic studies are correctly recorded. When a patient is discharged, the intern should write a concluding note which describes the final diagnosis and the patient's condition as he leaves the hospital. This should be countersigned by the attending physician.

### XI Teaching Program

**1 BEDSIDE TEACHING**—The most important phase of intern instruction consists in well conducted teaching at the bedside. By this is meant systematic instruction of the intern by the attending physician with an ample discussion of the history, the clinical and laboratory findings, the diagnosis and the treatment of each patient. To conduct such teaching properly is the duty of the attending physician in direct charge of the patients assigned to the intern. It cannot be delegated to others, though it may be supplemented by supervision of the intern's work by junior staff members or resident physicians. Duties which have no educational value should be avoided as far as possible.

**2 ASSIGNMENT OF CASES**—The teaching program should provide ample time for the intern to study and give thorough care to all patients assigned to him. An excessive number of patients is not conducive to careful work, indeed, undue pressure of routine tasks in a hospital may lead an intern to form habits which are undesirable and even harmful. For each intern assigned to a major service, such as internal medicine, surgery, obstetrics or certain specialties, such as neurology, an admission rate averaging not more than two patients a day is desirable.

**3 INTERNAL MEDICINE**—This department should afford each intern an adequate amount of instruction and experience in general medicine and in such special medical technics as transfusion, intravenous and other parenteral therapy, and paracentesis. Preferably there should be facilities for the study of patients with tuberculosis, and with contagious, nervous and mental diseases. Each intern should receive careful instruction in modern diet therapy with technical assistance from trained dietitians. The social aspects of medicine should also receive proper emphasis.

**4 SURGERY**—Surgical training should be planned to emphasize diagnosis and preoperative and postoperative treatment of surgical cases rather than skill in operative technic. Thus the intern's work in surgery should be rather that of an assistant than of an operator. The dressing of surgical wounds should be regarded as an important part of his experience, thus giving him a particularly valuable opportunity to observe carefully the immediate effects of surgical procedures and their treatment. He should obtain instruction and experience in administration of various types of anesthetics under the supervision of a trained anesthetist.

**5 OBSTETRICS**—The intern should obtain training and experience by delivering under supervision at least 10 patients. At other deliveries he should act as an assistant, not merely as an anesthetist.

**6 PATHOLOGY**—The intern should receive experience in clinical laboratory work to perfect his skill in routine laboratory procedures. He should also receive instruction from the pathologist in the procedures of pathologic diagnosis. He should attend and, when possible, assist at necropsies, receiving instruction in technic and in pathologic interpretation. He should be required to be familiar with the pathologic studies of surgical specimens and necropsy material which concern his own patients. No other assignment should be permitted to interfere with his attendance at the postmortem examination of any case which has been under his care. Whenever possible, he should assist in the preparation and presentation of the clinical-pathologic conference when cases assigned to him are being reviewed.

**7 OUTPATIENT DEPARTMENT**—It is desirable that each intern should have supervised experience in outpatient work under circumstances comparable to the office practice of medicine. Outpatient clinics to which interns are assigned should be operated in close affiliation with corresponding services in the hospital, thus encouraging careful follow-up work and observation of patients over a long period of time.

### XII Miscellaneous

**1 RECORD OF INTERNS' WORK**—Certain state medical examining boards, medical schools and other agencies may desire detailed information regarding the interns' training, and therefore it is suggested that hospitals keep a record of each intern's work. Such information may be supplied to the superintendent or record office by the intern himself on special forms where space is provided for data such as the period of time covered, the service, the number of patients admitted on service, the number of histories and physical examinations completed by the intern, the number of anesthetics given by him, the number of operations performed by him and the number in which he has assisted, the number of deliveries conducted by him and the number in which he has assisted, the number of necropsies attended, the hours spent in the laboratory, and the number of lectures, clinics and conferences attended.

**2 RULES REGARDING INTERNS**—The hospital should supply each intern with written or printed rules defining his duties and privileges.

**3 INTERNS' LIVING QUARTERS**—The hospital should provide for the intern comfortable living quarters, healthful food and suitable recreational opportunities.

**4 INTERNS' HEALTH**—The hospital should be responsible for the interns' health, at least to the extent of providing at the beginning of each intern's service a careful physical examination, including a roentgenogram of the chest and immunization against communicable diseases. There should be at all times a readily accessible consultation service for interns with some member of the staff definitely assigned to this work. Periodic

A physical examination of each intern's chest at six month intervals during his term of service is desirable.

5. **RELATIONSHIP BETWEEN HOSPITAL AND INTERN**—To avoid misunderstanding it is desirable that each intern at the time of his appointment should enter into a formal agreement with the hospital defining mutual obligations. Such agreement should be honorably fulfilled by both parties. The breaking of it by either a hospital or an intern is not condoned by the Council. Whenever complaint is made of a breach of agreement it is the policy of the Council to ask each of the parties to submit an explanatory statement. Such statements become a part of the physician's and the hospital's record.

### XIII Admission to the Approved List

1. **APPLICATION FOR APPROVAL**—Hospitals that desire to be accredited for intern training should apply to the Council on Medical Education and Hospitals of the American Medical Association 535 North Dearborn Street Chicago. For this purpose forms in duplicate will be supplied on request. They should be filled out with care by the superintendent or by some member of the staff who is familiar with the hospital's intern program, and one copy should be returned to the Council.

2. Approval for the training of interns is granted for the current year only and is subject to renewal annually. When conditions warrant it approval may be withdrawn at any time.

## CONTINUATION STUDY FOR PRACTICING PHYSICIANS IN THE UNITED STATES, 1941-1942

The need for adequate clinical facilities where physicians who do not limit their practice to a specialty may find ample opportunity to learn by personal examination of patients and by conduct of essential laboratory tests has long been recognized. Since 1937 the Council on Medical Education and Hospitals has been actively engaged in the collection of information available and programs in effect throughout the country for the education of practicing physicians. A review of the developments and of the accomplishments in this phase of graduate medical education based on a two year field study were published in composite form by the Council in May 1940.<sup>1</sup> This publication further contains a review of the Association's interest in graduate medical education since 1913. A statistical report of the opportunities available obtained by correspondence and questionnaire have appeared annually in *THIS JOURNAL* since 1938. The opportunities for continuation study have been reviewed again for the year 1941-1942 and are presented in this report.

### RECENT DEVELOPMENTS IN STATE AND LOCAL PROGRAMS

Financed by the California Tuberculosis Association are special extension courses for individual physicians at the San Francisco Hospital under the direction of the tuberculosis staffs of Stanford University and the University of California medical schools. Individual doctors receive their expenses and a per diem for a week's intensive specially arranged course.

Physicians of the District of Columbia, Maryland and Virginia participated in a postgraduate course in modern treatment of burns and the prevention and treatment of chemical casualties in modern warfare sponsored by the Medical Society of the District of Columbia in May 1942. No fee was charged. The course consisted of one hour lectures followed by a question period.

The Chicago Maternity Center holds a four months postgraduate course in obstetrics. The center trains forty physicians a year. Registration fee is \$10. Entering dates are staggered.

A course in clinical discussions of war neuroses, designed for senior medical students, interns, house officers and others who may become medical officers in the armed forces, is planned by the Institute for Psychoanalysis, Chicago, and the Department of Neuropsychiatry of Michael Reese Hospital in October 1942. No registration fee.

The Iowa State Medical Society sponsors courses through its Speakers Bureau. They are general in nature and designed to refresh the general practitioner on certain fundamental aspects of various more common conditions. There is no limitation on the number of physicians attending. Recorded courses were initiated. This type of instruction was designed for the small audience of the more rural portions of the state. In addition recorded lectures have been sent to county medical societies and hospital staffs which do not have scheduled courses.

The Committee on Postgraduate Education of the Maine Medical Association has formulated plans for inaugurating home study courses in medicine, surgery, pediatrics, obstetrics and gynecology. They are being patterned after similar courses which have been carried on by the American Academy of Ophthalmology and Otolaryngology during the past three years.

The Department of Public Health at the Massachusetts Institute of Technology is offering an accelerated program of public health training which began June 8, and on completion of the course, Feb. 6, 1943 a Master's degree will be awarded. These training programs are organized for public health engineers, health educators and public health laboratories, as well as for administrators.

Courses for physicians in the Kenny technic for the management of acute phases of poliomyelitis sponsored by the National Foundation for Infantile Paralysis were given during six six day periods at the University of Minnesota Center for Continuation Study.

Two series of meetings on obstetrics and one on pediatrics were conducted during the past fiscal year by the Maternal and Child Health Committee of the Montana State Medical Association, which serves as an advisory committee to the Division of Maternal and Child Health of the state board of health. A total of twelve centers with two sessions at each center, covering the southeastern, northwestern and southwestern areas, was reached during this period.

Postgraduate clinics held by visiting lecturers from out of the state were given at Duke University School of Medicine, Durham, N. C., on the emergencies of civilian and war medicine and surgery. Weekly postgraduate courses in obstetrics and pediatrics are given at Duke Hospital through the cooperation of the North Carolina State Board of Health, the University of North Carolina School of Public Health and the United States Children's Bureau. The courses are limited to six physicians, and no tuition is charged.

A series of four day intensive courses for teaching the medical aspects of chemical warfare were given

*(Continued from page 1295)*

by the University of Cincinnati College of Medicine. The first group which took the course were physicians from New England, New York and the Middle Atlantic states. Later courses were offered to physicians from other parts of the country.

Courses in internal medicine in five teaching centers in nine separate circuits in the state of Tennessee are offered. The course is sponsored by the Commonwealth Fund of New York, Tennessee State Medical Association, Tennessee State Department of Health, Vanderbilt University School of Medicine and the University of Tennessee College of Medicine. The course is open to all licensed physicians in the state, and one lecture a week is given in each center for a period of ten weeks. This is a two year program, which commenced in February 1941.

The Texas State Tuberculosis Sanatorium presented a series of lectures and clinical demonstrations on diseases of the chest for physicians of Texas. There were no fees charged and the physician remained as a guest of the hospital for this two week course.

#### RECENT DEVELOPMENTS IN NATIONAL PROGRAMS

The American Academy of Ophthalmology and Otolaryngology sponsors two series of educational courses for their members. The first consists of three day lectures at the time of the annual meeting of the academy. The second course consists of a home study course. It is designed primarily for residents in these specialties but is open to any licensed physician. It is a home reading course accompanied by examination and covers nine months of the year.

The American College of Physicians continues to offer courses in special subjects for members of the college and for physicians preparing for certification by the American Board of Internal Medicine.

The annual Clinical Congress of the American College of Surgeons constitutes an important educational event for Fellows of the College and members of its Junior Candidate Group. During March the college held twenty-seven war sessions throughout the country which were open to the entire profession.

While the Commonwealth Fund of New York is not conducting directly any programs, it is giving considerable assistance in the field of postgraduate medical education.

From time to time the Division of Venereal Disease of the United States Public Health Service has sponsored a four week postgraduate course in clinical management and public health control of venereal diseases at the United States Public Health Service Medical Center, Hot Springs National Park, Ark.

Courses for medical officers of the Army on active duty are given repeatedly throughout the year.

The United States Department of Labor, Children's Bureau, Washington, D. C., continues to provide funds for the postgraduate education of practicing physicians.

#### CONTINUATION STUDY FOR PRACTICING PHYSICIANS, 1941-1942

Opportunities provided for practicing physicians during the fiscal year ended July 1, 1942 are outlined in tables 1-A, pages 1296-1297, 1-B, pages 1300-1305 and table 2, pages 1306-1310. Courses reported in table 1-A were of a peripatetic character in that instruction was offered to the practicing physician in a number of different places in or near his local community. Centers listed in table 1-B provide ample facilities for clinical instruction. In the first type of course the instructors usually do most of the traveling, while in the latter the

physician desiring continuation study travels to the center where clinical teaching may be emphasized over longer periods. In table 2 are summarized graduate assemblies of less than five days and study courses.

#### ORGANIZATION AND ADMINISTRATION

Opportunities for continuing professional study for practicing physicians near their home communities held a prominent place in nineteen states. These programs reached a total of two hundred and forty-eight centers. Of thirty-six sponsoring agencies, committees on postgraduate education of state medical societies, independently or with the state departments of health or medical schools, supervised programs in fifteen states. State health departments were active participants in eleven states, the extension division of six universities, two state tuberculosis associations, a school of public health and a hospital also cooperated in bringing programs to the practitioner.

In centers where ample clinical facilities are available (table 1-B) graduate courses of five days to one year's duration were offered in three hundred and eighteen educational institutions or agencies located in sixty-nine centers in thirty-two states and the District of Columbia. Ninety-two agencies or combinations of agencies participated in the planning of programs. Courses were sponsored by six state agencies and given outside the state.

Graduate schools of medicine, or postgraduate divisions of institutions, played the most prominent part in offering courses of five or more days' duration. Thirty-four undergraduate medical schools have given such courses. Thirteen state medical societies independently or in collaboration with state health departments planned courses for physicians of the state. Twelve health departments made contributions. In ten instances hospitals were the agencies offering short periods of study. Other sponsors included state departments of public health, the American College of Physicians, the American College of Surgeons, the American Academy of Ophthalmology and Otolaryngology, Georgia Warm Springs Foundation, the Mayo Foundation, National Foundation for Infantile Paralysis, the United States Public Health Service, tuberculosis associations, as well as local, state, national and international agencies organized primarily for the purpose of providing graduate opportunities.

In medical school programs the deans were indicated as directing officers of more than half of the postgraduate courses. The head or a member of the department in which the study is offered often directed the course. Chairmen of postgraduate educational committees in universities and of medical societies, directors of departments of health and the chief of staff of several hospitals acted as administrators.

#### METHODS OF INSTRUCTION

Opportunities for instruction in pediatrics seemed to be among the courses most generally offered for physicians continuing professional study near their home. Such programs were available in ninety-nine centers in seven states. Programs covering the general subjects of medicine and surgery were offered in ten states.

Instruction was given once weekly at intervals of from ten weeks to six months, while one offered a three day course. Sessions of one or two days were most commonly the stated duration.

In addition to lectures and round table discussions, many of the courses for physicians in their own communities were planned to include clinics, symposiums,

demonstrations and conferences. The traveling faculties for these extramural courses were chosen mainly from within the state sponsoring the course. The faculties of medical schools provided instructors in fourteen instances. Three home study courses were offered.

The description of intensive courses gave evidence that clinical instruction was primarily featured. The study of general medical subjects, the specialties and subspecialties was offered in various combinations in three hundred and eighteen medical centers. In the specialty group while courses in obstetrics and pediatrics were most commonly offered, many were offered in dermatology and syphilology, gynecology, ophthalmology, cardiology, orthopedic surgery, otolaryngology and psychiatry. Other special topics of study included allergy, anesthesia, fractures, chemotherapy, endocrinology, gastroscopy, hematology, plastic surgery, poliomyelitis, psychology, public health, radiology, tropical medicine and tuberculosis. Courses in preclinical subjects included anatomy, pathology and physiology. Intensive courses were also given in aviation medicine, emergency treatment of war casualties and varied civilian and military practice.

The duration of study in centers with clinical facilities varied from five days to one year. One hundred and fifty-five courses were completed within three weeks or less while one hundred and thirty-five lasted from one to four months and ten courses were offered for periods of five months to one year. Four were of a year's duration. In others the length of the course varied.

In only nine instances were the courses in centers with clinical facilities wholly didactic. Clinical instruction and practical experience included laboratory and operative demonstrations, symposiums, seminars, assignment of patients, case presentation, clinical pathologic and roentgen ray conferences, moving pictures, ward rounds, field trips and bedside teaching.

In addition to medical schools and hospitals, laboratories, outpatient departments, clinics and local health units cooperated by placing their facilities at the disposal of the students.

The faculties of the medical schools offering continuation courses were called on for assistance in instruction in two hundred and fifty-four courses. Additional instructors were specialists in their field, an equal number being chosen from within the state as from out of state.

#### REGISTRATION

The practicing physician was invited to twenty of the courses which had as their purpose the instruction of physicians practicing in or near the community in which the course was given. In nine others membership in the county or state medical society was a requirement. The number registered for any one course ranged from 8 to 1,540.

In the majority of courses featuring clinical instruction the M.D. degree was necessary for enrollment, although medical students were admitted to one course, while nurses, technicians, doctors of philosophy, sanitarians, engineers and public health workers registered in five specialized courses. M.D.'s reported attending this type of continuation course totaled 14,879. Two hundred and sixty-four courses had registrations of less than 40, in twenty-four the enrollment ranged from 41 to 75, in fifteen from 76 to 200 and in six over 201. In six instances the registration reached beyond 500. The greatest attendance at any one course was 3,100. For twenty courses the number registered was not obtained.

For seventeen of the itinerant continuation courses no charge to the physician was made. The fees for other courses averaged \$5, although in two instances a fee of \$25 was charged.

In continuation courses featuring clinical instruction of more than five days in one center the fees ranged from a registration fee of \$5 to tuition of \$1,000. In twenty-one no fees were charged the individual.

State medical societies made substantial contributions to all programs of continuation study. Likewise financial assistance was received from state departments of health, federal bureaus, medical schools, the Commonwealth Fund, Bingham Associates Fund, National Foundation for Infantile Paralysis, the Trudeau Foundation, Lilla Babbitt Hyde Foundation and others.

#### CLINICAL CONFERENCES, GRADUATE ASSEMBLIES AND STUDY COURSES

In twenty-eight states clinical conferences, graduate assemblies and study courses of less than five days were held during 1941-1942. These data are assembled in table 2, pages 1306-1310. Seventy-seven assemblies or short lecture courses held under the auspices of eighty-nine agencies either independently or in collaboration were reported. Fifteen state medical societies and twelve medical schools sponsored clinical conferences, assemblies and study courses. Seven tuberculosis associations and one heart association reported this type of study. Miscellaneous groups comprised the remainder. An especially appointed director of the clinics or chairman of the committee responsible was reported for most of the courses.

The majority of the large assemblies surveyed pertinent topics in general medicine and surgery. Scattered study courses sponsored by medical societies or agencies concentrating on certain fields included varied subjects, as chemotherapy, early clinical diagnosis of neoplastic diseases, pneumonia typing technique, interpartum care, medical aspects of gas warfare, problems of civil and military emergencies and sulfonamide therapy.

The assemblies were usually held in centers large enough to accommodate the registrants and with facilities for clinical and practical work and for scientific exhibits.

Of the seventy-seven courses, thirty were confined to didactic instruction. The remainder used the facilities of hospitals, medical schools, outpatient departments and laboratories to conduct clinics, demonstrations, clinical pathologic conferences and symposiums. Faculty members of medical schools took an active part in thirty-two of the courses. Instruction from other than faculties of medicine was evenly divided between physicians from the state and physicians from outside the state.

Practicing physicians were eligible for admission to all courses, but courses sponsored by three state medical societies was limited to members. Registration fees ranged from \$2 to \$25, but for the most part no fee was charged. The largest attendance recorded at any one assembly was 1,200. In a few instances no attendance was reported.

#### SUMMARY

In thirty-nine states some form of continuation study for practicing physicians was provided. In nine states, namely, Delaware, Idaho, Nevada, New Mexico, South Dakota, Utah, Washington, West Virginia and Wyoming no courses were reported. However, the state health departments of Arizona, Maine, Nevada, North Dakota, South Dakota, Utah and Washington sponsored courses outside the state.
